63. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disengaged from said carriage but adapted to be brought into coöperative relation therewith and with said type mechanism at a given point in the forward traverse of said carriage, a mechanism for releasing said carriage from the control of said escapement, and key-actuated stops for arresting said carriage at different distances from a predetermined point, substantially as described.

64. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disengaged from said carriage but adapted to be brought into coöperative relation therewith at a given point in the forward traverse of the carriage, a mechanism for releasing said carriage from the control of the escapement, and key-actuated stops arranged at letter-space distances apart and adapted to arrest said carriage at different letter-space distances from a predetermined point, substantially as described.

65. The combination with type mechanism, a power-driven escapement-controlled carriage, a carriage release and stop mechanism adapted to release the carriage and to reëngage and stop the carriage at a given point, of adding mechanism brought into operative relation with the carriage and type mechanism when the carriage reaches said point, substantially as described.

66. The combination with type mechanism, a power-driven escapement-controlled carriage, a mechanism for releasing said carriage, and a stop interposable in the path of said carriage or a part thereon and adapted to arrest the carriage at a given point, with adding mechanism brought into operative relation with the carriage and type mechanism when the carriage reaches said point, substantially as described

67. The combination with type mechanism, a power-driven escapement-controlled carriage, an adding mechanism adapted to be brought into operative relation with the carriage and type mechanism when the carriage reaches a predetermined point in its forward traverse, release mechanism adapted to release the carriage, and a stop interposable in the path of a part on or connected to and moving with the carriage to arrest the carriage so that upon the reingagement of the carriage with its controlling mechanism the adding mechanism will be in proper operative relation with said carriage and type mechanism, substantially as described.

68. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disengaged from said carriage and inactive during a part of the forward traverse of said carriage and brought into operative relation therewith and with the type mechanism at a predetermined point in the forward motion of said carriage, a carriage-release mechanism adapted to release the carriage and permit it to run forward under the influence of the power, and a stop interposable in the path of a part on or connected to and moving with said carriage, said power, said release and said stop devices coöperating to permit or cause the power-driven carriage to move forward quickly to and to be arrested at said predetermined point on the release of the stop, substantially as described.

69. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism normally disengaged but adapted to be brought into coöperative relation with the carriage and type mechanism when the carriage reaches a predetermined point in its forward traverse, a series of carriage-stops arranged at letter-space distances apart and adapted to arrest the carriage at different distances from a given point and means for releasing the carriage and permitting it to be driven forward quickly until arrested by the selected interposed stop, substantially as described.

70. The combination of type mechanism, a power-driven escapement-controlled carriage, adding mechanism brought into operative relation with the carriage and type mechanism when the carriage reaches a predetermined point in its forward traverse, a carriage-release mechanism, a series of carriage-stops arranged at letter-space distances apart and adapted to arrest the carriage at different distances from a given point, and keys for simultaneously releasing the carriage and interposing said stops, substantially as described.

71. The combination of type mechanism, a power-driven carriage, and adding mechanism adapted to be brought into operative relation with the carriage and type mechanism when the carriage reaches a predetermined point in its forward traverse, a series of key-levers each having a carriage-stop at one end, a coöperating step or lug on the carriage adapted to coact with said key-operated stops, a universal bar actuated by all of said key-levers, a carriage-controlling escapement adapted to be operated by the operation of said universal bar and said key-levers to release the power-driven carriage and permit it to run forward freely until arrested by the stop interposed by the depression of one of said key-levers whereby the adding mechanism is brought into said operative relation and the carriage is immediately positioned for writing numbers in proper relation to other numbers in columnar arrangement, substantially as described.

72. The combination of type mechanism, a carriage, an adding mechanism having independent means for operating its number-carriers, a driver for operating said independent means one at a time and said driver and said means being disengaged during a part of the forward traverse of said carriage, and said driver and said adding mechanism being relatively movable step by step, means for automatically connecting said step-by-step element with the carriage when the latter reaches a given position in its forward traverse and moving step by step thereafter as the carriage moves into the positions in which there is engagement between said driver and said independent means, and means for moving the non-step-by-step movable element into position where there will not be engagement between said driver and said independent means while the said step-by-step moving element is in its positions for said engagement, substantially as described.

73. The combination of type mechanism, a carriage, an adding mechanism having independent means for operating its number-carriers, a driver for operating said independent means one at a time and disengaged therefrom during a part of the forward traverse of the carriage, mechanism for connecting said driver with said carriage when the carriage reaches a given point in its forward traverse and thereafter moving the driver step by step into positions for meshing with and from one to another of said independent means, and means for moving said adding mechanism into and out of position for actuation by said driver, substantially as described.

74. The combination of type mechanism, a carriage, a series of number-wheels each provided with two gears, as 179, 180, independent pinions 181 meshing with gears 179, independent pinions 182 meshing with gears 180, independent gears 178 meshing with pinions 181, pinions 183 journaled eccentrically of and on gears 178 and adapted to coact with pinions 182 to "carry," spring-detents engaging said pinions 183 and permitting them to rotate freely in but one direction, said number-wheels, gears 178, 179, 180, pinions 181, 182, 183 and detents forming an adding mechanism, a driver adapted to operate said gears 178 one at a time but out of engagement therewith during part of the forward traverse of the carriage and said driver and said adding mechanism being movable one relatively to the other in a step-by-step manner to cause engagement or mesh of said driver and said gear 178, mechanism connecting said driver with type-operating mechanism to rotate the driver, and mechanism for connecting the stop-by-step moving element of the driver adder-couple with the carriage when the carriage reaches a given point in its forward traverse and for moving said movable element step by step as the carriage further progresses step by step after such connection is made, substantially as described.

75. The combination of type mechanism, a carriage, a series of number-wheels each provided with two gears, as 179, 180, independent pinions 181 meshing with gears 179, independent pinions 182 meshing with gears 180, independent gears 178 meshing with pinions 181, pinions 183 journaled eccentrically of and on gears 178 and adapted to coact with pinions 182 to "carry," spring-detents engaging said pinions 183 and permitting them to rotate freely in but one direction, said number-wheels, gears 178, 179, 180, pinions 181, 182, 183 and detents forming an adding mechanism, a driver adapted to operate said gears 178 one at a time but out of engagement therewith during part of the forward traverse of the carriage, and said driver be movable step by step into engagement or mesh with and from one to another of said gears 178, mechanism connecting said driver with type-operating mechanism to rotate the driver and mechanism for connecting the driver with the carriage when the carriage has reached a given point in its forward traverse and for moving said driver step by step into engagement with and from one to another of said gears 178 as the carriage further progresses step by step after such connection is established, substantially as described.

76. The combination of type mechanism, a carriage, two independently-rotatable number-wheels having the same axis of motion, a gear 179 on the wheel of lower denomination, a gear 180 on the wheel of higher denomination, a pinion 181 meshing with gear 179, a pinion 182 meshing with gear 180, a gear 178 meshing with pinion 181, a one-way yielding detent on gear 178 adapted to intermittently actuate pinion 182 to carry, said number-wheels, gears 178, 179, 180, pinions 181, 182 and detent forming an adding mechanism, a driver adapted to operate said gear 178 but out of engagement therewith during part of the forward traverse of the carriage, and said driver and said adding mechanism being movable one relatively to the other in a step-by-step manner to cause engagement or mesh of said driver and said gear 178, mechanism connecting said driver with type-operating mechanism to rotate the driver and mechanism for connecting the stop-by-step moving element of the driver adder-couple with the carriage when the carriage reaches a given point in its forward traverse and for moving said movable element step by step as the carriage further progresses step by step after such connection is made, substantially as described.

77. The combination of type mechanism, a carriage, two number-carrying wheels independently rotatable on the same axis, a gear 179 on the wheel of lower denomination, a gear 180 on the wheel of higher denomination, a pinion 181 meshing with gear 179, a pinion 182 meshing with gear 180, a driver-gear 178 meshing with pinion 181, a pinion 183 pivoted on gear 178 eccentrically thereof and adapted to engage with pinion 182 to "carry," a detent permitting said pinion 183 to rotate freely in but one direction, said number-wheels, gears 178, 179, 180, pinions 181, 182, 183 and the detent forming an adding mechanism, a driver adapted to operate said gear 178 but out of engagement therewith during part of the forward traverse of the carriage, and said driver and said adding mechanism being movable one relatively to the other in a step-by-step manner to cause engagement or mesh of said driver and said gear 178, mechanism connecting said driver with type-operating mechanism to rotate the driver and a mechanism for connecting the step-by-step moving element of the driver adder-couple with the carriage when the last reaches a given point in its forward traverse and for moving said movable element step by step as the carriage further progresses after such connection is made, substantially as described.

78. The combination of type mechanism, a carriage, a series of number-wheels independently rotatable on the same shaft or axis, a series of independent driving or motion-transmitting gears operatively connected each with the corresponding number-wheel and provided with stop pins or lugs, a series of pivoted detent-fingers adapted to coact with said stop pins or lugs to arrest said gears in given positions, and a frictional device for reversely rotating said wheels and gears until said fingers arrest said pins or lugs and bringing said wheels and gears to their initial or zero positions with a driver for operating said gears one at a time and disengaged therefrom during a part of the forward traverse of the carriage and operatively connected with type-operating mechanism, and mechanism for connecting said driver with the carriage when the carriage has reached a given point in its forward traverse and for thereafter moving the driver step by step as the carriage progresses and into engagement with and from one to another of said gears, substantially as described.

79. The combination of type mechanism, a carriage, an adding mechanism having independently-operable number-carriers, driver mechanism for operating said adding mechanism and disengaged therefrom during a part of the forward traverse of the carriage, a shaft journaled in the framework and discontinuously geared with the carriage but continuously geared with the driver mechanism, and connections between the driver mechanism and type mechanism, substantially as described.

80. The combination of type mechanism, a carriage, an adding mechanism having independently-operable number-carriers, a driving mechanism for operating said adding mechanism, connections between the driver mechanism and type mechanism, and a shaft journaled in the framework intermediate said driver mechanism and said carriage and continuously geared with one and discontinuously geared with the other of said driver mechanism and carriage elements, substantially as described.

81. The combination with a type-writing mechanism, including a carriage, a series of letter and figure types, and keys therefor, of a tabulating mechanism for controlling the movement of the carriage, and an adding mechanism brought into operative connection with both the carriage and the figure keys upon the operation of the tabulating mechanism, substantially as described.

82. The combination of a platen, means for feeding said platen letter-space distances, a series of letter and figure types which coöperate with the platen and keys therefor, a series of adding-wheels, and key-controlled selecting means for automatically connecting the figure-keys with any of the adding-wheels, substantially as described.

83. The combination of a platen, means for feeding said platen letter-space distances, a series of letter and figure types which coöperate with the platen and keys therefor, a series of adding-wheels, a selecting-key associated with each adding-wheel, and means called into action upon the operation of any one of said selecting-keys for connecting its associated wheel with the figure-types, substantially as described.

84. The combination with the carriage of a type-writing machine, of a series of adding-wheels, means controlled by the carriage at one portion of its forward traverse for connecting any of the wheels to the figure-keys of the type-writing machine, and a series of tabulating-stops for arresting the carriage at any selected point in said portion of its travel, substantially as described.

85. The combination with the carriage of a type-writing machine of a series of adding-wheels, means controlled by the carriage at one portion of its forward traverse for connecting any of the wheels with the figure-keys of the type-writing machine, and a series of key-controlled stops for arresting the carriage at any selected point in said portion of its travel, substantially as described.

86. In a type-writing and adding mechanism, the combination of a power-driven carriage, a series of adding-wheels, means controlled by the carriage at one portion of its forward traverse for connecting any of the adding-wheels with the figure-keys of the type-writing machine, releasing mechanism for the carriage, a key constructed to operate the releasing mechanism, and a stop constructed to coact with the release-key for stopping the carriage, after its release, at the said portion of its forward traverse, substantially as described.

87. In a type-writing, tabulating and adding mechanism, the combination of a power-driven carriage, a series of adding-wheels, means controlled by the carriage at one portion of its forward traverse for connecting any of the adding-wheels with the figure-keys of the type-writer, a releasing device for the carriage, a series of keys constructed to operate the releasing device, and a series of stops constructed to coact with the releasing-keys for stopping the carriage, after its release, at any point in said portion of its travel, substantially as described.

88. The combination of a series of letter and figure types, a series of keys therefor, a carriage connected for letter-space movements to all the keys, whereby numbers may be written in a column on a predetermined portion of a page, and words may be written opposite numbers, a series of adding-wheels, and means automatically called into action only during the movement of the column past the printing-point in both directions of the carriage travel, for connecting the adding-wheels consecutively to the figure-keys at the forward traverse of the carriage, and for restoring said adding-wheel-connecting means to initial position at the return traverse thereof, substantially as described.

89. The combination of a series of letter and figure types, a series of keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, and means automatically called into action during only the final portion of the forward traverse of the carriage for connecting the adding-wheels consecutively to the figure-keys, and only during the initial portion of the reverse movement of the carriage for restoring said adding-wheel-connecting means to initial position, substantially as described.

90. The combination of a series of letter and figure types and keys therefor, a series of adding-wheels, a selecting-key associated with each adding-wheel, and means called into action upon the operation of any one of said selecting-keys for automatically connecting its associated wheel with the figure-keys and simultaneously moving the carriage so that the corresponding digit-column on the paper is brought to the printing-point, substantially as described.

91. The combination of a series of letter and figure types, a series of keys therefor, a power-driven carriage connected to all the keys for letter-space movements, a series of adding-wheels, a series of tabulating-keys connected to the carriage, each of which is constructed to release the carriage and cause it to be arrested at a predetermined point, the carriage being constructed, to automatically connect with the adding-wheels upon being so released, and to automatically bring into connection with the figure-keys the adding-wheel that corresponds to the digit-column that is brought to the printing-point when the carriage is so arrested, substantially as described.

92. The combination of a power-driven paper-carriage, including letter and figure types and keys therefor, a series of adding-wheels, driving means therefor, said wheels and said driving means being relatively movable, key-operated variable stop mechanism connected to the paper-carriage and constructed to release and encop the same to be arrested at different points, as determined by the particular stop-key operated, and means controlled by said carriage for automatically connecting said wheel-driving means to the carriage after it is so released and before it is so arrested, so as to produce a relative movement of the adding-wheels and their said driving means, and to thereby connect to the figure-keys the adding-wheel that corresponds to the digit-column that is brought to the printing-point when the carriage is so arrested, substantially as described.

93. In a combined type-writing and adding machine, mechanism whereby type-writing may be done on one part of the line without adding, and whereby adding may be done at the end of the line when writing figures in a column, a set of denomination or order keys connected to the adding mechanism and to the paper-carriage of the type-writer for variably positioning the paper-carriage and adding mechanisms, whereby when any selected denomination-key is actuated the paper-carriage is released and brought rapidly to a point corresponding to the denomination of the number to be written in the column, and at the same time the adding mechanism is automatically adjusted to a corresponding point, so that when a type-key is struck the figure will be printed in the proper position in the column, and the adding-wheel of the same denomination will be simultaneously affected, so as to correctly add the figure printed.

94. The combination of a series of letter-types and keys therefor, a series of figure-types and keys therefor, a carriage connected for letter-space movements to all the keys, whereby words may be written at one portion of each line in connection with numbers written at another portion of each line, a series of adding-wheels, means called into action at a predetermined portion of the traverse of the said carriage for engaging any adding-wheel to the figure-keys, and means for enabling any key to limit the rotative movement of the adding-wheel to an extent corresponding with the numeral represented by the key, whereby the successive numbers so written at such portion of the carriage traverse may be added, substantially as described.

95. The combination of a carriage, a series of figure-types and keys therefor, a series of number-carriers, a series of independently-movable devices, as 178, for operating said number-carriers, a variable-throw driver operatively connected to said figure-keys and constructed and arranged to drive said number-carrier-operating devices one at a time, automatically-operative means controlled by said carriage for causing a relative step-by-step movement between said driver and said number-carrier operating devices, and hand-operated means for positioning said movable devices where the step-by-step movement thereof and the driver with relation one to another will be ineffective to bring the parts into coöperative relation, substantially as described.

96. The combination of a series of figure-types and keys therefor, a series of number-carriers, a series of independently-movable devices for operating said number-carriers, a variable-throw driver connected to said figure-keys and constructed and arranged to drive said number-carrier-operating devices one at a time, means controlled by said carriage for causing a relative step-by-step movement between said driver and said number-carrier-operating devices, and key-controlled selecting means for automatically connecting the figure-keys and driver with any desired number-carrier, substantially as described.

97. The combination of figure-types and keys therefor, a, paper-carriage, number-wheels, a gear on each side of and fixed to each of the number-wheels, gears 178, one for each of the number-wheels, one or more pinions 183 pivoted to each of said gears 178, and intermediate pinions 181 and 182 between the gears 178 and the gears on the number-wheels, there being twice as many pinions 181 and 182 as there are gears 178.

98. The combination of a series of figure-types and keys therefor, a paper-carriage controlled by said keys, a rack 191 moved by said carriage, a pinion 195 meshing with said rack, a second pinion 198 moved by said pinion 195, a rack 199 meshing with the pinion 198, a gear 190, the axial movement of which is controlled by the rack 199, and number-carriers operable one at a time by said gear 190, substantially as described.

99. The combination of a series of key-controlled figure-types, a carriage, an adding mechanism including a second carriage, speed-multiplying connections between said carriages, and key-controlled selecting means for automatically connecting the figure-keys with any desired number-carrier in said adding mechanism, substantially as described.

100. The combination of a series of figure-types and keys therefor, a carriage, a series of number-carriers, a driver for operating said carriers one by one, connections between said driver and the figure-keys, speed-multiplying connections between said carriage and said driver, and a series of selecting-keys for automatically connecting the driver with any desired number-carrier, substantially as described.

101. The combination of a series of figure-types and keys therefor, a carriage, a series of number-wheels, a series of independently-operable gears for actuating said number-wheels, said gears being placed at intervals greater than the letter-space movements of said carriage, a driving-pinion movable in an axial direction from gear to gear, speed-multiplying mechanism connecting said carriage to said driving-pinion, connections from said pinion to said figure-keys, substantially as described.

102. The combination of a series of figure-types and keys therefor, a carriage, a series of number-wheels, a series of independently-operable gears for actuating said number-wheels, said gears being placed at intervals greater than the letter-space movements of said carriage, a driving-pinion movable in an axial direction from gear to gear, speed-multiplying mechanism connecting said carriage to said driving-pinion, connections from said pinion to said figure-keys, and a key-controlled selecting mechanism for automatically connecting the driver with any desired number-carrier, substantially as described.

103. The combination of a series of figure-types and keys therefor, a carriage, a series of number-wheels, a series of independently-operable gears which coöperate with and are adapted to actuate said number-wheels, gear 190 which is operatively connected to said figure-keys, rack 191, pinion 195, pinion 198, rack 199, said racks and pinions comprising intermediate mechanism between the carriage and gear 190, for bringing about an axial movement of said gear 190 and the actuating-gears with relation one to another, and a key-controlled selecting mechanism for automatically connecting said gear 190 with any desired number-wheel-actuating gear, substantially as described.

104. The combination of a key-operated type mechanism, a carriage, adding mechanism, a driver for independently operating each element of the adding mechanism, connections between said driver and said carriage for moving the driver in one direction from element to element of the adding mechanism, connections from said key-operated type mechanism for moving said driver variable distances in another direction to operate said adding mechanism, and a key-controlled selecting mechanism for automatically connecting said driver with any desired element of the adding mechanism, substantially as described.

105. The combination of a key-operated type mechanism, a spring-propelled carriage, a series of adding-wheels, a driver movable from wheel to wheel, connections from said driver to said key-operated mechanism for moving said driver in one direction, connections from said driver through said carriage to said key-operated mechanism for moving said driver in another direction, and connections from said driver through said carriage to an independent series of keys for automatically connecting said driver with any desired wheel, substantially as described.

106. The combination of a key-operated type mechanism, a series of adding-wheels, a series of independently-actuable gears for operating said adding-wheels, a driving-pinion common to all of said gears, a reciprocatory frame for operating said driving-pinion, a series of key-operated cams connected to said type mechanism for operating said reciprocatory frame, means for moving said driving-pinion from gear to gear, and a key-controlled selecting mechanism for automatically connecting said driving-pinion with any desired gear, substantially as described.

107. The combination of a key-operated type mechanism, a carriage, an adding mechanism including another carriage, said carriages being spring-propelled and the carriage of the adding mechanism being connected to move at greater speed than the first-mentioned carriage, and connections between said type mechanism and said adding mechanism, whereby the number printed at the operation of a key is automatically added, substantially as described.

108. The combination of a series of figure-types, keys therefor, a carriage, an adding mechanism including a carriage, said carriages being spring-propelled and the carriage of the adding mechanism being connected to move faster than the first-mentioned carriage, connections between said type-keys and said adding mechanism, whereby the number printed at the depression of a key is automatically added, and a key-operated mechanism for connecting said figure-keys simultaneously with any desired number-carrier of the adding mechanism, substantially as described.

109. The combination of a series of number-carriers, a key-controlled common actuator therefor, a propelling-spring for causing relative movements between said number-carriers and said actuator, an escapement mechanism for controlling said movements, a releasing mechanism, and a key-controlled stop mechanism, whereby said spring is enabled to cause a rapid relative movement between said number-carriers and said actuator, independently of said escapement mechanism, and whereby said relative movement is arrested at a point predetermined by said key-controlled stop mechanism, substantially as described.

110. The combination of a series of figure-types, keys therefor, a series of number-carriers, a common actuator for said carriers, connections from said keys to said actuator, a propelling-spring for causing relative movements between said number-carriers and said actuator, escapement mechanism for controlling said relative movements, releasing mechanism, and a key-controlled stop mechanism, whereby said spring is enabled to cause relative movement between said number-carriers and said actuator, independently of said escapement mechanism, and whereby said relative movement is arrested at a point predetermined by said key-controlled stop mechanism, substantially as described.

111. The combination of a series of figure-types, keys therefor, a series of number-wheels, a common rotary driver for said number-wheels, connections from said driver to said keys, a propelling-spring for moving said driver in an axial direction along said series of number-wheels, escapement mechanism for controlling said axial movements of the common driver, a releasing mechanism, a series of stops, and a series of denomination-keys connected to said stops and to said releasing mechanism, the construction and arrangement being such that at the depression of any of said denomination-keys said common driver is released from the control of said escapement mechanism and is moved rapidly by said propelling-spring until arrested by the stop associated with the operated denomination-key, and in position to effect a rotation of the number-wheel corresponding to the denomination of the said depressed key.

112. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means controlled by said letter-keys for effecting a letter-space feed of the carriage, adding mechanism, actuating means therefor, and key-controlled mechanism for effecting a movement of the carriage through any desired number of letter-space distances and to place the adding mechanism and its actuating means in coöperative relation.

113. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means controlled by said letter-keys for effecting a letter-space feed of the carriage, adding mechanism, actuating means therefor, means for maintaining said adding mechanism out of operation during a portion of the movement of the carriage, and key-controlled mechanism for effecting a movement of the carriage through any desired number of letter-space distances and to automatically place the adding mechanism and its actuating means in coöperative relation.

114. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means controlled by said letter-keys for effecting a letter-space feed of the carriage, adding mechanism, actuating means therefor, and key-controlled mechanism for effecting a movement of the carriage through any desired number of letter-space distances and to place any desired portion of the adding mechanism and its actuating means in coöperative relation.

115. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means controlled by said letter-keys for effecting a letter-space feed of the carriage, actuating mechanism therefor, and key-controlled mechanism for releasing the carriage from its letter-space-feeding mechanism to permit a free movement of the carriage through any desired number of letter-space distances and to place the adding mechanism and its actuating means in coöperative relation and to automatically reëngage the carriage with the letter-spacing means after the carriage has been moved as described.

116. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means for effecting a letter-space feed of the carriage, adding mechanism, actuating means therefor, and selecting mechanism for effecting a free movement of the carriage throughout any number of letter-space distances and to automatically arrest the carriage at any one of a number of positions where the adding mechanism and its actuating means are brought into coöperative relation.

117. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means for effecting a letter-space feed of the carriage, adding mechanism, actuating means therefor, a plurality of key-controlled selecting-stops carried by the framing of the machine and means coöperating therewith for effecting a free movement of the carriage throughout any number of letter-space distances and to automatically arrest the carriage at any one of a number of positions where the adding mechanism and its actuating means are brought into coöperative relation.

118. In a combined type-writing and adding machine, the combination of a carriage, letter-keys, means for effecting a letter-space feed of the carriage, adding mechanism which during certain portions of the movement of the carriage is maintained out of operation, actuating means for said adding mechanism, key-controlled mechanism for releasing the carriage from its letter-spacing means, and adjustable means for determining the point of arrest of the carriage and whether or not the adding mechanism is to be rendered operative.

119. The combination of a carriage, letter-keys, means for effecting a letter-space feed of the carriage, adding mechanism, means for maintaining the adding mechanism out of operation during certain portions of the movements of the carriage, but which causes the adding mechanism to be automatically brought into condition to be operated by a further movement of the carriage, actuating means for said adding mechanism, key-controlled mechanism for releasing the carriage from its letter-spacing means and for automatically selecting any desired element of the adding mechanism for operation, and adjustable means for determining the point of arrest of the carriage and whether or not the adding mechanism is to be rendered operative.

120. The combination with a type-writing machine, of adding mechanism operatively connected therewith, said adding mechanism comprising adding-wheels, a driver and means for moving said driver in an axial direction, and hand-operated means for adjusting said driver and its coöperating adding-wheels one with relation to the other without disconnecting the driver from said moving means, whereby the driver though rotated is rendered ineffective to coöperate with its coöperating mechanism.

121. The combination with a type-writing machine, of adding mechanism operatively connected therewith, said adding mechanism comprising number-wheels, a driver, means for automatically moving said driver in an axial direction, and a plurality of intermediate wheels which transmit motion to the number-wheels and which coöperate with the driver, and hand-operated means for adjusting said driver and its coöperating wheels one with relation to the other, whereby the driver though rotated is rendered ineffective to coöperate with its intermediate wheels and number-wheels.

122. The combination with a type-writing machine, of adding mechanism, key-controlled denominational mechanism for automatically rendering any desired portion of the adding mechanism operative and for simultaneously positioning the carriage of the type-writing machine to the corresponding denominational position.

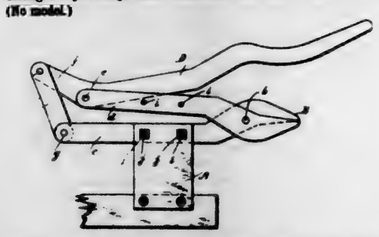
123. The combination with a type-writing machine, of adding mechanism comprising number-wheels and means for operating the number-wheels, and key-controlled denominational mechanism for automatically rendering any desired number-wheel of the adding mechanism operative by its operating means and for simultaneously positioning the carriage of the type-writing machine to the corresponding denominational position.

124. The combination with a type-writing machine of adding mechanism, key-controlled denominational mechanism for automatically rendering any desired portion of the adding mechanism operative and for simultaneously positioning the carriage of the type-writing machine to the corresponding denominational position, and indices for said denominational mechanism.

125. The combination of a carriage, letter-keys, means controlled by said letter-keys for effecting a letter-space feed of the carriage, adding mechanism, actuating means therefor, key-controlled mechanism for effecting a movement of the carriage through any desired number of letter-space distances and to place the adding mechanism and its actuating means in operative relation, and denominational indices for said key-controlled mechanism.

126. The combination with a type-writing machine, of adding mechanism which is adapted to be automatically thrown into or out of coöperative relation with the type-writing machine by an operation of the machine, said adding mechanism comprising a plurality of disconnected independently-operable number-wheels, an axially-moved driver which rotates all of said wheels, and intermediate mechanism between said driver and number-wheels, whereby the said intermediate mechanism performs the "carrying" operation of the number-wheels.

709,478. SHEARS. SAMUEL H. FORTNEY, Jefferson township, Montgomery county, Ohio. Filed Mar. 29, 1902. Serial No. 100,588. (No model.)

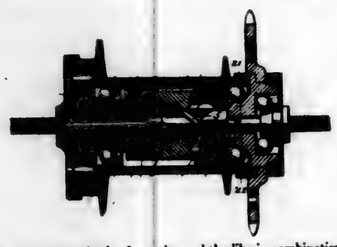


Claim.—The combination, with a pair of shear-blades having crossed and pivoted handles each provided with two similar bolt-holes *i* spaced at the same distance apart, and lever mechanism for operating the said handles; of a flat supporting-plate secured in a vertical position and having bolt-holes at its upper part corresponding with the said holes *i*, and two bolts which pass through the said bolt-holes and connect the said handles interchangeably with the said plate, substantially as set forth.

709,479. COASTER-BRAKE. CHARLES GLOVER, New Britain, Conn., assignor to P. & F. Corbin, a Corporation of Connecticut. Filed June 11, 1901. Serial No. 64,086. (No model.)

Claim.—1. In a device of the character described in combination, an axle, a wheel-hub, a driver, a worm carried thereby, internally-threaded sleeve mounted on said worm and coasting therewith, a brake and a brake-actuator, clutch devices separate from the sleeve and between said sleeve and said hub and between said sleeve and said brake-actuating means for independently connecting or disconnecting the driver with said hub or with said brake-actuating means.

2. In a power-transmitting and brake mechanism for cycles and the like in combination, a wheel-hub, a brake mechanism therefor, a driver, a clutch between said driver and said brake mechanism and a separate clutch between said driver and said hub and an internally-threaded sleeve separate from each of said clutches and located between the same and mounted on said driver, and means to impart both rotary and longitudinal movement to said sleeve to independently throw and detachably hold either of said clutches in operative engagement with the hub or the brake-actuator.

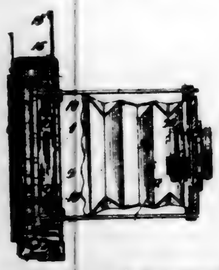


3. In a coaster-brake for cycles and the like in combination, an axle, a driving-wheel, a hub therefor, a brake, brake-actuating means, a driver, an extension from said driver, a worm thereon, an internally-threaded sleeve mounted on said extension, a clutch loosely mounted on said extension, a socket carried by the hub and adapted to receive said clutch, a second clutch on the opposite side of said sleeve coacting with said brake-actuating means, said sleeve and clutches having independent longitudinal movement, means for locking said parts against independent rotary movement, and a spring-lever carried by one of said parts and bearing against the other.

4. In a device of the character described in combination, a shifting device comprising three members arranged end to end said members being independent of one another for limiting the longitudinal movement, and means to couple the same against independent rotative movement, and a spring-lever mounted upon the intermediate member and bearing against the other members, and independent clutch devices coacting with the end members of said shifting device, a driving-wheel connected with one of said independent clutch devices, and a brake coacting with the other of said independent clutch devices.

5. In a device of the character described in combination, a wheel-hub, a brake mechanism therefor, a driver, means coacting with the driver and controlled by the direction of rotation of the same to engage either said wheel-hub or said brake mechanism, said means comprising a shifting device formed of three members arranged end to end, and a lever carried by the intermediate member, and means to normally project the ends of said lever beyond the end faces of said intermediate members.

709,480. FOLDING STEREOSCOPIC CAMERA. CARL P. GOERZ, Friedenau, near Berlin, Germany. Filed May 1, 1901. Serial No. 58,317. (No model.)



Claim.—1. A folding stereoscopic camera, comprising a body made out of a piece of especially-profiled tubing, having bellows parted by a movable partition in two attached thereto, the other end of which is closed by the objective board; pins in the corners of said objective board engaging slots and spring-pressed arms hinged to said body of the camera; a shutter for covering and uncovering the sensitized surface moving in front of same and having means for operating it; and means for shifting one of the objectives from its lateral position to the central one; substantially as shown and described.

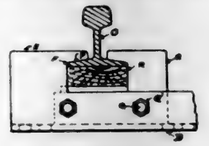
2. In a folding camera of the kind hereinbefore described a partition-wall for separating the cones of rays produced by the two objectives, said partition formed by a flexible strip of light-proof material provided at its edges with narrow bands, said strip being fixed to the objective board and with the other end movably fastened to the body of the camera; substantially as shown and described.

3. In a folding stereoscopic camera of the kind hereinbefore described an objective board, having an oblong opening; two objectives carried by said board, one fixed and the other movable, one of the objective tubes movably arranged in said opening and means of suitable dimensions for closing said opening; substantially as shown and described.

4. In a folding stereoscopic camera of the kind hereinbefore described an objective board, an objective tube sliding in the same, a light-proof band fixed to said objective tube and guidings for the edges of the same; substantially as shown and described.

5. In a folding stereoscopic camera of the kind hereinbefore described an objective board, having a fixed and a movable objective and a central and a lateral opening for the movable objective tube; on front of said objective board being arranged movable means bearing the tube of the movable objective arranged in such a way that said tube may be brought to coincide with either of the openings; substantially as shown and described.

709,481. RAILROAD-TIE. JAMES L. GREER, Philadelphia, Pa. Filed Nov. 24, 1899. Renewed Jan. 20, 1902. Serial No. 91,851. (No model.)



Claim.—1. A railway-tie consisting of base B, provided with openings C, and having sides D extending at right angles to said base; vertical extensions E at each end of said tie provided with a recess F; clamps G having lateral projections J and K forming recess L and adapted to be secured to said tie; and cushions R adapted to be interposed between the tie and rail and within the said recesses, substantially as shown and described.

2. An elastic cushion in combination with a metal bearing-plate having notches or recesses to fit in the upright sides of the tie and provided with one or more openings to secure said cushions thereon.

709,482. PROCESS OF ELIMINATING THE SULFUR FROM SULFID ORES. ADOLPH GUTTMANN, London, England, assignor to Sulphur Elimination Syndicate, Limited, London, England. Filed Feb. 21, 1901. Serial No. 48,363. (No specimens.)

Claim.—1. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with carbon and a sodium salt which will yield sulfid of sodium when the mixture is heated, the amount of carbon added being largely in excess of the amount required to form the sulfid of sodium heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

2. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with carbon and sodium sulfid, heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

3. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with crushed iron pyrites, carbon and a sodium salt which will yield sulfid of sodium when the mixture is heated, the amount of carbon added being largely in excess of the amount required to form the sulfid of sodium heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

4. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with crushed iron pyrites, carbon, sodium chlorid, and sodium sulfid, heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

5. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with carbon, sodium chlorid and a sodium salt which will yield sulfid of sodium when the mixture is heated, the amount of carbon added being largely in excess of the amount required to form the sulfid of sodium, heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

6. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with carbon, sodium chlorid and sodium sulfid, heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

7. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with crushed iron pyrites, carbon, sodium chlorid and a sodium salt which will yield sulfid of sodium when the mixture is heated, the amount of carbon added being largely in excess of the amount required to form the sulfid of sodium, heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

8. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with crushed iron pyrites, carbon, sodium, chlorid, and sodium sulfid, heating the mixture to a temperature approaching incipient redness, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

9. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with carbon and a sodium salt which will yield sulfid of sodium when the mixture is heated, the amount of carbon added being largely in excess of the amount required to form the sulfid of sodium, heating the mixture to a temperature approaching incipient redness, adding sodium chlorid during the heating, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

10. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with carbon and sodium sulfid, heating the mixture to a temperature approaching incipient redness, adding sodium chlorid during the heating, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

11. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with crushed iron pyrites, carbon and a sodium salt which will yield sulfid of sodium when the mixture is heated, the amount of carbon added being largely in excess of the amount required to form the sulfid of sodium, heating the mixture to a temperature approaching incipient redness, adding sodium chlorid during the heating, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

12. The hereinbefore-described process for the elimination of sulfur from sulfid ores, consisting in crushing the ore, mixing it with crushed iron pyrites, carbon and sodium sulfid, heating the mixture to a temperature approaching incipient redness, adding sodium chlorid during the heating, and then exposing it freely to air to effect its oxidation and burn off all sulfur that is set free.

709,483. TIRE AND FASTENER FOR VEHICLE-WHEELS. JACQUES C. HAINES, Chicago, Ill., assignor of two-thirds to William E. Huber and Chester Haines, Chicago, Ill. Filed Mar. 10, 1902. Serial No. 97,998. (No model.)

Claim.—1. A tire-fastener comprising a channel-rim, an elastic tire within the channel of said rim, a series of fastening members partially embedded in the tire and projecting therefrom, adapted to be brought into contact with the bottom surface of said rim, and binding-wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim.

2. A tire-fastener comprising a channel-rim, an elastic tire within the channel of said rim, a series of fastening members partially embedded in the tire and projecting therefrom, the projecting portion of larger cross-

section than the embedded portion, and binding-wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim.

3. A tire-fastener comprising a channel-rim, an elastic tire within the channel of said rim, a series of fastening members partially embedded in the tire and projecting from each side thereof, and binding-wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim.

4. A tire-fastener comprising a channel-rim, an elastic tire within the channel of said rim, a series of fastening members partially embedded in the tire and projecting from each side thereof, a circumferentially-elastic structure embedded in said tire joining the two series of fastening members, and binding-wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim.

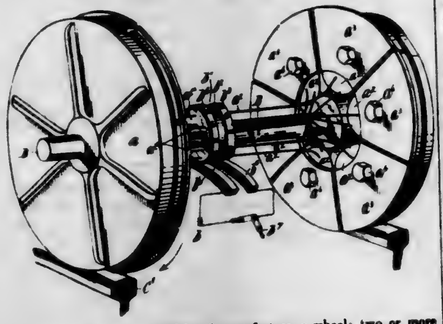
5. A tire-fastener comprising a channel-rim, an elastic tire within the channel of said rim, a series of fastening members formed of a single wire partially embedded in said tire, projecting from each side of said tire, the projecting portions of larger cross-section than the embedded portions, and binding-wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim.

6. A tire-fastener comprising a channel-rim, an elastic tire tapered gradually and outwardly toward each side from its transverse center, within said rim, a series of fastening members projecting from each side of said tire near the outside terminations of said tapered portions, and binding-wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim and thereby compress that portion of the tire contained between said series of fastenings.

7. A tire-fastener comprising a series of fastening members attached at each side of the tire between its largest and smallest diameters, a resilient tire gradually tapered outwardly toward both sides from its smallest diameter at its transverse center, a channel-rim upon which said tire is mounted, and binding-wires adapted to draw the fastenings into contact with the bottom surface of the said rim.

8. A tire-fastener comprising a series of fastening members attached at each side of the tire between its largest and smallest diameters, a resilient tire gradually tapered outwardly toward both sides from its smallest diameter at its transverse center, a channel-rim upon which said tire is mounted, binding-wires adapted to draw the fastenings into contact with the bottom surface of the said rim, and transverse connections between said fastenings, embedded in the tire adapted to compress the tire between the respective fastenings when said fastenings have been drawn to their respective positions by said binding-wires.

709,484. MAGNETIC WHEEL. JOHN O. HEINER, Jr., Revere, Mass. Filed Feb. 24, 1902. Serial No. 95,169. (No model.)



Claim.—1. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; a ring-plate made of magnetizable sections, concentric with said wheel, the circumference of said plate forming a portion of the tread of the complete wheel; and means for securing said ring-plate to said yokes; said wheel, yokes, and ring, being of magnetic material, and designed to permit free access to said yokes.

2. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; a ring-plate made of magnetizable sections, concentric with said wheel and having its circumference form a portion of the tread of the complete wheel, the inner face of said plate being cut away to engage shoulders formed on the yokes; and means to secure said plate to said yoke; said wheel, yokes and plate, being of magnetic material; all designed to give great strength to the complete wheel, and free access to said yokes and coils.

3. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; sector-like plates, whose arcs are concentric with said wheel and form portions of the tread of the complete wheel; and means to secure said sector-like plates to said yokes; said wheel, yokes, and plates, being of magnetic material; all designed to give free access to said yokes and coils.

4. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; sector-like plates whose arcs are concentric with said wheel, and form portions of the tread of the complete wheel; the inner face of each plate being cut away to engage a shoulder formed on the yokes, thereby increasing the strength of the complete wheel; coils of wire wound about said yokes; and means to secure said plates to said yokes; said wheels, yokes and plates being of magnetic material.

5. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; a ring-plate made up of magnetizable sections, concentric with said wheel, the circumference of said plate forming a portion of the tread of the complete wheel; means for securing said ring-plate to said yokes; insulated wire wound about each of said yokes; said wheel, yokes, and ring-plate being of magnetic material, and designed to permit free access to said yokes and coils.

6. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; a ring-plate made up of magnetizable sections, concentric with said wheel and having its circumference form a portion of the tread of the complete wheel, the inner face of said plate being cut away to engage shoulders formed on the yokes; means to secure said plate to said yokes; said wheel, yokes and plate being of magnetic material; and insulated wire wound about each of said yokes; all designed to give great strength to the complete wheel; and free access to said yokes and coils.

7. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; sector-like plates whose arcs are concentric with said wheel and form portions of the tread of the complete wheel; means to secure said sector-like plates to said yokes; said wheel, yokes, and plates, being of magnetic material; insulated wire wound about said yokes; all designed to give free access to said yokes and coils.

8. As an article of manufacture, a wheel; two or more yokes projecting from the side thereof; sector-like plates whose arcs are concentric with said wheel, and form portions of the tread of the complete wheel; the inner face of each plate being cut away to engage shoulders formed on the yokes, thereby increasing the strength of the complete wheel; coils of wire wound about said yokes; and means to secure said plates to said yokes; said wheels, yokes, and plates, being of magnetic material.

9. In a vehicle, the combination of an axle, and two wheels mounted thereon, each wheel having two or more yokes projecting from the side thereof; a ring-plate made up of magnetizable sections, concentric with said wheel, the circumference of said plate forming a portion of the tread of the complete wheel; means for securing said ring-plate to said yokes; insulated wire wound about each of said yokes; each of said wheels, yokes and rings being of magnetic material, and designed to permit free access to said yokes and coils.

10. In a vehicle, the combination of an axle and two wheels mounted thereon, each wheel having two or more yokes projecting from the side thereof; a ring-plate made up of magnetizable sections concentric with said wheel and having its circumference form a portion of the tread of the complete wheel, the inner face of said plate being cut away to engage shoulders formed on the yokes; means to secure said plate to said yokes; said wheels, yokes and plates being of magnetizable material; and insulated wire wound about each of said yokes; all designed to give great strength to the complete wheels and free access to said yokes and coils.

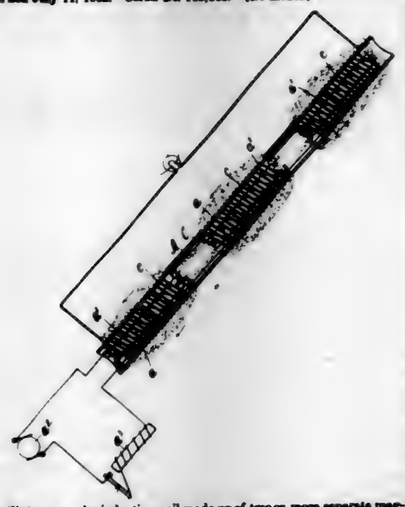
11. In a vehicle, the combination of an axle and two wheels mounted thereon, each wheel having two or more yokes projecting from the side thereof; sector-like plates whose arcs are concentric with said wheel and form portions of the tread of the complete wheel; means to secure said sector-like plates to said yokes; said wheel, yokes, and plates, being of magnetic material; an insulated wire wound about said yokes; all designed to give free access to said yokes and coils.

12. In a vehicle the combination of an axle and two wheels mounted thereon, each wheel having two or more yokes projecting from the side thereof; sector-like plates whose arcs are concentric with said wheel, and form portions of the tread of the complete wheel; the inner face of each plate being cut away to engage a shoulder formed on said yokes, thereby increasing the strength of the complete wheel; coils wound about said yokes; and means to secure said plates to said yokes; said wheels, yokes and plates being of magnetic material.

13. In a vehicle, the combination of an axle and two wheels mounted thereon, each wheel having two or more yokes projecting from the side thereof; a ring-plate made up of magnetizable sections, concentric with said wheel, the circumference of said plate forming a portion of the tread of the complete wheel; means for securing said ring-plate to said yokes; insulated wire wound about each of said yokes; each of said wheels, yokes and rings being of magnetic material, and designed to permit free access to said yokes and coils; and means whereby an electric current may be caused to pass around one or more of said yokes.

14. In a vehicle, the combination of an axle and two wheels mounted thereon, each wheel having two or more yokes projecting from the side thereof; a ring-plate made up of magnetizable sections concentric with said wheel and having its circumference form a portion of the tread of the complete wheel, the inner face of said plate being cut away to engage shoulders formed on the yokes; means to secure said plate to said yokes; said wheels, yokes and plates being of magnetizable material; and insulated wire wound about each of said yokes; all designed to give great strength to the complete wheels and free access to said yokes and coils; and means whereby an electric current may be caused to pass around one or more of said yokes.

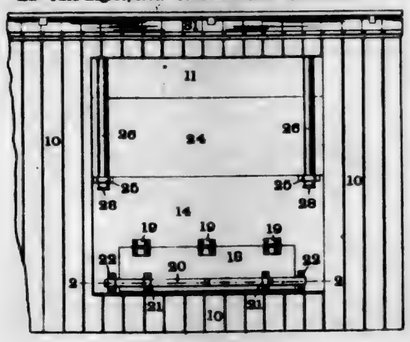
709,485. INDUCTION-COIL. JOHN O. HEINER, Jr., Revere, Mass. Filed July 11, 1902. Serial No. 115,169. (No model.)



Claim.—1. An induction-coil made up of two or more separate magnetic cores; a primary coil surrounding the said cores and having as many sections as there are cores; a continuous insulating mass surrounding said primary coil and cores; a secondary coil wound about said insulating mass, and consisting of as many sections as there are cores, or sections in said primary coil.

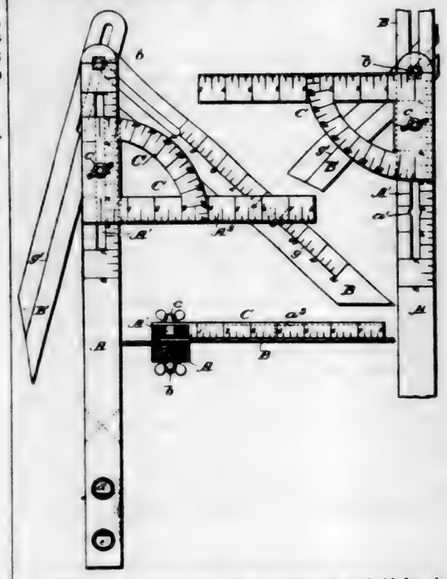
2. The combination of an induction-coil, made up of two or more separate magnetic cores; a primary coil surrounding said cores; a continuous insulating mass surrounding said primary coil and cores; a secondary coil wound about said insulating mass; and a source of electrical energy for said primary coil, whereby it may be magnetized and demagnetized.

709,486. GRAIN-DOOR FOR CARS. LOUIS A. HOSIER, St. Louis, Mo. Filed Aug. 30, 1901. Serial No. 73,603. (No model.)



Claim.—The combination with a railway-car, of a pair of hanger-rods pivoted to said car, a door slidingly mounted on said hanger-rods, and an extension hinged to the upper edge of said door to swing against said hanger-rods when in its raised position.

709,487. BEVEL. DANIEL B. HOSHER, Rupp, Pa. Filed Apr. 24, 1902. Serial No. 104,505. (No model.)



Claim.—1. In combination with the bifurcated stock, blades pivoted to one end thereof, of a protractor and square connected to the stock to be adjustable longitudinally thereon, substantially as shown.

2. In combination with a bifurcated and slotted stock, slotted blades pivoted to one end thereof so as to be slidable on the pivot, a protractor and square adjustably connected to the stock, said protractor and square having flanges at right angles to the faces thereof, substantially as set forth.

3. In combination with a bifurcated and slotted stock, of slotted blades pivotally attached to the stock, the blades having central gage-lines, one of the blades having in addition to the center gage-line a scale of inches, a scale of inches on the stock, and a combined protractor and square, the protractor having degree-marks and the square an inch-scale, the marks commencing on a line with the center of the slot through the stock, substantially as shown.

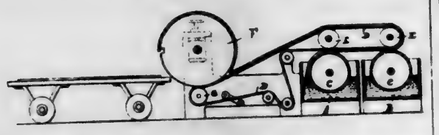
4. In a bevel, the combination with a bifurcated stock having a longitudinal slot, a pivot and clamping means at the end beyond the slot, a pair of slotted blades which are adjustable upon the pivot, a slide mounted on the stock and provided with depending sides which extend beyond the blades, substantially as shown.

5. In combination with a bevel having blades as shown, of a combined protractor and square which is adjustably attached to the stock of the bevel, the protractor having a scale indicative of degrees, the first degree being marked to register with the center of the stock and on a line with the center of the pivot which connects the blades to the stock, a flange depending from the outer edge of the protractor and marked to correspond with the mark indicative of degrees on said protractor, a member projecting at right angles and provided with a scale of inches and a depending portion with a corresponding scale, the depending portions of the protractor and square being adapted to abut against the side of the stock, substantially as shown.

709,488. PROCESS OF MAKING ARTIFICIAL LUMBER. WILLIAM S. HUNTINGTON, New York, N. Y., assignor to the Composite Board Company, a Corporation of New York. Filed Feb. 18, 1901. Serial No. 47,709. (No specimens.)

Claim.—1. The process of making artificial lumber which consists in forming and compacting wood-pulp into moist slabs or sheets, and dry-

ing the same in a heated atmosphere charged with materials capable of hardening and imparting flexibility to the same.



2. The process of making artificial lumber, which consists in forming and compacting wood-pulp into slabs or sheets, drying the same by heat in the vapor or fumes of materials capable of imparting hardness and flexibility to the same, and then flattening and finishing the sheets, as set forth.

3. The process of making artificial lumber which consists in subjecting slabs or sheets of wood-pulp in a wet state to the action of heat in the presence of the vapor or fumes of materials capable of imparting hardness and flexibility to the slabs and then superposing and uniting the dry slabs by pressure, as set forth.

4. The process of making artificial lumber which consists in subjecting individual wet slabs or sheets of wood-pulp to the action of heat in the presence of materials capable of imparting hardness and flexibility to the same, then subjecting the slabs to pressure to correct the distortion incident to drying, then applying adhesive material to the slabs and superposing and uniting two or more of the same by pressure, as set forth.

5. The process of making artificial lumber, which consists in drying individual wet slabs or sheets of wood-pulp in an atmosphere charged with materials capable of imparting hardness and flexibility thereto, then subjecting the slabs to pressure to correct the distortion incident to drying, then resurfacing the slabs to impart a smooth surface thereto, then applying an adhesive material to the surfaces, and then superposing and uniting two or more of the slabs and simultaneously imparting the desired form to the finished product by means of pressure, as set forth.

6. The process of making artificial lumber which consists in drying wet slabs or sheets of wood-pulp by the action of heat in the vapor or fumes produced by sulfuric acid, litharge, casein and an alkali, as set forth.

709,489. MANUFACTURE OF ALLOYS OF THE ALKALI METALS. GEORGES F. JAUBERT, Paris, France. Filed Feb. 23, 1901. Serial No. 48,415. (No specimens.)

Claim.—1. The method of manufacturing alloys of the alkali metals, such as potassium and sodium, which consists in mixing one of the metals with a caustic oxid of the other metal, then heating the mixture in vacuo at a temperature of from 200° to 300° centigrade, and in then allowing the residue to cool, substantially as and for the purposes described.

2. The method of manufacturing an alloy of the alkali metals, which consists in mixing potassium with caustic soda in required proportions, then heating the mixture in substantial vacuo at a temperature of from 200° to 300° centigrade, and in finally cooling the residue, substantially as and for the purposes described.

709,490. PROCESS OF COMPRESSING PEROXID OF SODIUM. GEORGES F. JAUBERT, Paris, France. Filed Apr. 22, 1901. Serial No. 57,115. (No specimens.)

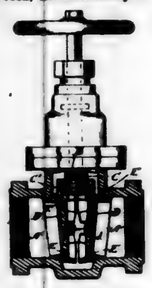
Claim.—The method of compressing sodium peroxid, which consists in first pulverizing the sodium peroxid, then melting and pulverizing another salt, then mixing the pulverized sodium peroxid and the pulverized salt and finally compressing the mixture into pastils or tablets.

709,491. STRAIGHTWAY VALVE. DANIEL KENNEDY, Brooklyn, N. Y. Filed Nov. 16, 1901. Serial No. 82,501. (No model.)

Claim.—1. In a valve having inclined seats, disks with inclined outer faces and an operating-screw which is received between the disks, and posts D' D' in the backs having concave bearing-faces arranged on each side respectively of the operating-screw, the combination therewith of two lenticular bearing-pieces G' G' matching in the concave seats on such posts, all adapted to serve substantially as herein specified.

2. In a valve having inclined seats, disks with inclined outer faces an operating-screw which is received between the disks, and posts D' D in the backs having concave bearing-faces arranged on each side respectively of the operating-screw, the combination therewith of two lenticular bearing-pieces matching in the concave seats on each posts, and a ring G connecting such bearing-pieces adapted to hold such bearing-pieces apart, all arranged to serve substantially as herein specified.

3. A stop-valve provided with a ring arranged between the disks and having two lenticular bearing-pieces integral therewith and matching in corresponding recesses in the back of said disks so as to support the same with liberty to rock, all substantially as herein specified.



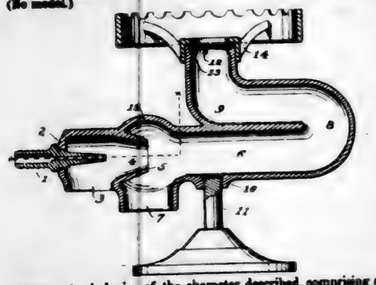
709,492. PIN-TICKET. JOHN P. KUHNS, Dayton, Ohio, assignor, by mesne assignments, to National Tag Company, Sanford, Me., a Corporation of Maine. Filed Oct. 19, 1901. Serial No. 79,227. (No model.)

Claim.—1. The combination of a ticket-blank having staple-prong openings therethrough, and a staple having staple-prongs in said openings and also having alined portions on one face of said ticket, said alined portions being integrally united at their inner ends by a laterally-bent portion lying in the same horizontal plane with said alined portions, said staple-prongs and portions being formed of a continuous piece of wire, substantially as specified.

2. The combination of a ticket-blank having oppositely-located staple-prong openings therethrough, and a staple having staple-prongs in said openings and also having an integral head upon one face of said ticket-blank, said head consisting of longitudinally-alined portions lying in a plane passing through said openings and integrally joining said staple-prongs at their outer ends, the adjacent ends of said alined portions being connected by a laterally-bent central portion lying in the same horizontal plane as said alined portions, said staple being formed of a continuous piece of wire, a portion of said ticket-blank folded back upon itself and there secured with said staple-head between said folded portions and said bent portion impinging in the crotch of said fold, substantially as specified.

3. In a pin-ticket, the combination of a pin-ticket blank divided into two portions by folding a portion thereof back upon said blank, two separated staple-prong openings extending through one portion of said blank at a distance from the crotch of said fold, and a staple having staple-prongs extending through said openings, and also having a staple-head integrally joining with and projecting inward in longitudinal parallelism from said prongs and lying within said fold of said blank, said staple-head having a projection impinging in the crotch of said fold, and said folded portions of said ticket-blank being secured together, substantially as specified.

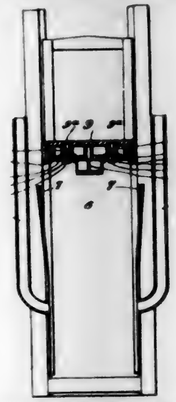
709,493. ATMOSPHERIC GAS-HEATING BURNER. JAMES J. LAWLER, Mount Vernon, N. Y. Filed June 10, 1901. Serial No. 63,899. (No model.)



Claim.—1. A device of the character described, comprising a horizontally-arranged nozzle connected to the gas-inlet, a primary mixing-chamber having a closed end and its other end continued to form a tapering nozzle, one end of said first-named nozzle extending into said primary mixing-chamber, said primary mixing-chamber having a vertically-arranged air-inlet, a secondary mixing-chamber formed integral with the end of the primary mixing-chamber and having a vertical air-inlet, the tapering nozzle carried by the primary mixing-chamber extending into said secondary mixing-chamber, the secondary mixing-chamber being continued to form a tortuous mixing-chamber with an elbow carried by the end of the last-named mixing-chamber, and a burner supported by said elbow, substantially as described.

2. A device of the character described, comprising a horizontally-arranged primary mixing-chamber having a closed end and means connected thereto for supplying the gas to said chamber, the one end of said chamber being continued to form a nozzle, said chamber having an air-inlet on its under side, a secondary mixing-chamber carried by the primary mixing-chamber and having an air-inlet on its under side, the said nozzle extending into the secondary mixing-chamber, a tortuous mixing-chamber connected to the secondary mixing-chamber and carrying a burner, substantially as described.

709,494. SAFETY DEVICE FOR ELEVATORS. ABEL W. LEACH, Indianapolis, Ind. Filed June 5, 1902. Serial No. 110,308. (No model.)



Claim.—1. In a safety device for elevators, the combination with a well having air-escapes operative only during the initial portion of the fall of the elevator-car therein, of a car having air-escape valves in the bottom thereof, operative during the remainder of the fall.

2. In a safety device for elevators, the combination of a well and car each having air-exits, the exits of the well closing successively at the fall of the car.

3. In a safety device for elevators, in combination with a well having a flared upper portion, and air-escape tubes between the flared portion and the bottom thereof, of a car having valves in its floor, whereby a gradually-decreasing air-escape is permitted, substantially as described.

4. The combination with an elevator-well, of a car therein having spring-pressed air-escape valves in the floor thereof, operated by compression of air in the well, and a relief-valve in said floor, substantially as described.

709,495. MOLDING-BOX FOR THE MANUFACTURE OF BUILDING-STONES. EDWARD LEVI, Zurich, Switzerland. Filed June 27, 1902. Serial No. 113,474. (No model.)

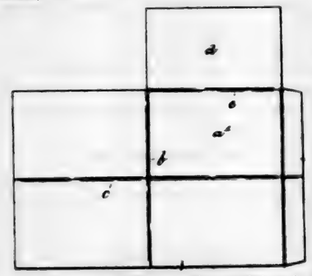
Claim.—1. A molding-box for the manufacture of building-stones consisting of a bottom and front and back walls attached thereto by joints, of removable side walls and intermediate partition-walls parallel to the same, running from the front to the back wall, dividing the space formed by the four walls into regular rectangular chambers, and of means to press the front and back walls against the side walls and partitions, the bottom of the box having rectangular hollowed channels in each separate chamber and above the chambers and projecting into them cross-bars which are removably adjusted in slits in the front and back walls and having in each chamber on the inner side of the front wall projections tapering downward and on the inner side of the back wall similarly-shaped hollowings for the purpose of producing stones of a rectangular form, having at their lower side rectangular nooses and at their upper side corresponding slits and on the one end hollowings tapering away downward and on the other end similarly-formed projections.

2. In a molding-box for the manufacture of building-stones consisting of a bottom and front and back walls attached thereto by joints, of removable side walls and intermediate partition-walls parallel to the same, means for pressing the front and back walls of the box against the side and intermediate walls, consisting of bows reversible upward, movably attached to the side walls, which bows have stretching-screws acting on the front and back walls and means to retain the bows in their lower position.

3. In a molding-box for the manufacture of building-stones consisting of a bottom and front and back walls attached thereto by joints, of removable side walls and intermediate partition-walls parallel to the same, bows reversible upward, movably adjusted to the side walls which bows are provided with stretching-screws for the purpose of pressing the front and back walls against the side and intermediate walls and means to retain the bows in their lower position consisting in the fact that the bows have nooses catching into pins which are fixed to the side walls of the box.

4. In a molding-box for the manufacture of building-stones consisting of a bottom and front and back walls attached thereto by joints, and of removable side walls, partition-walls parallel to the side walls dividing the space formed by the four exterior walls into regular, rectangular chambers, each separate chamber having in its bottom hollowed channels and, at the top, cross-bars, and having also on the front wall inner projections tapering coninally downward and on the back wall similarly-formed inner hollowings, and apertures in the front and back walls arranged longitudinally in every chamber in which rods of corresponding shape are inserted for the purpose of forming apertures running longitudinally right through the stone.

709,496. FOLDING MONEY HOLDER OR ENVELOP. EDWIN L. HELLER, Williamsport, Pa. Filed June 6, 1902. Serial No. 110,414. (No model.)



Claim.—1. A money holder or envelop, consisting of a flat sheet of cardboard or paper, creased and folded to form a flat tube, a strip projecting from one of the infolded portions of the tube and united to the other portion of said tube to complete said tube, said tube creased transversely intermediate of its open ends to form two pockets, a closure formed at said transverse crease and common to both pockets, and an end flap projecting from one of the infolded portions of the tube beyond one of the pockets and arranged to fold down over both pockets, when said pockets are folded inward along the common closure.

2. A blank for a money holder or envelop consisting of a rectangular body portion divided by bisecting creases into four rectangular panels, a rectangular flap projecting from one of said panels and coequal in area therewith, and an oblong strip projecting from one side of the rectangular body portion and adapted to be fastened to two of the rectangular panels when said panels are creased down upon the other panels of the body to form a tubular body portion, substantially as and for the purposes described.

709,497. CHURN. ALEXANDER MITCHELL, Orrisw, Canada. Filed Apr. 23, 1902. Serial No. 104,224. (No model.)

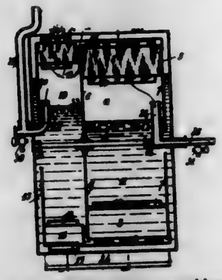
Claim.—1. In a churn or like device, a reciprocating means comprising a rectangular framework mounted upon supporting-legs, transverse shafts journaled in said framework and carrying rollers thereon, a platform having depending flanges and mounted on said rollers, a lever-arm pivoted to the lower side of said platform, a slotted beam mounted lon

gitudinally below said framework and extending beyond one end thereof, a transverse pin in said beam passing through a slot in the opposite end of said lever, a second lever pivoted at an intermediate point to said beam and connected at one end to the first said lever by an intermediate link, a hand-lever also pivoted at an intermediate point in said beam and connected to the opposite end of said second lever by a link, a treadle carried by said last-mentioned link, and means for removably securing a vessel upon said table to prevent lateral shifting thereon.

2. In a churn or like device, a reciprocating means comprising a rectangular framework mounted upon supporting-legs, transverse shafts journaled in said framework and carrying rollers thereon, a platform having depending flanges mounted on said rollers, a lever-arm pivoted to the lower side of said platform, a slotted beam mounted longitudinally below said framework and extending beyond one end thereof, a transverse pin in said beam passing through a slot in the opposite end of said lever, a second lever pivoted at an intermediate point to said beam and connected at one end to the first said lever by an intermediate link, a hand-lever also pivoted at an intermediate point in said beam and connected to the opposite end of said second lever by a link, a treadle carried by said last-mentioned link, transverse cleats mounted on said platform, and a peg projecting from the center of said platform adjacent to the side of one of said cleats.

3. A churn comprising a stationary framework having supporting-legs, rollers journaled therein, a platform having longitudinal guiding means supported upon said rollers and adapted to reciprocate thereon, a lever pivoted at one end to the lower side of said platform, a beam extending longitudinally beneath said framework and beyond one end thereof, a transverse pin upon which the other end of said lever is journaled, a hand-lever journaled in the end of said beam, a treadle connected thereto, intermediate mechanism connecting said hand-lever and treadle to said first-named lever, cleats upon the upper side of said table, and a covered vessel having interlocking cleats on its lower side to prevent lateral shifting on the platform.

709,498. APPARATUS FOR MIXING GASES. ALFRED MOLIT, Buenos Ayres, Argentina. Filed Oct. 5, 1900. Serial No. 32,151. (No model.)



Claim.—1. A gas-mixing apparatus comprising a casing with air and gas inlets and an outlet for the mixed air and gas, and a plurality of drums mounted upon a common shaft, each of said drums having a series of adjacent peripheral chambers with inner and outer walls concentric to the central shaft with outer and inner tubular extensions overlapping the respective adjacent chambers, substantially as set forth.

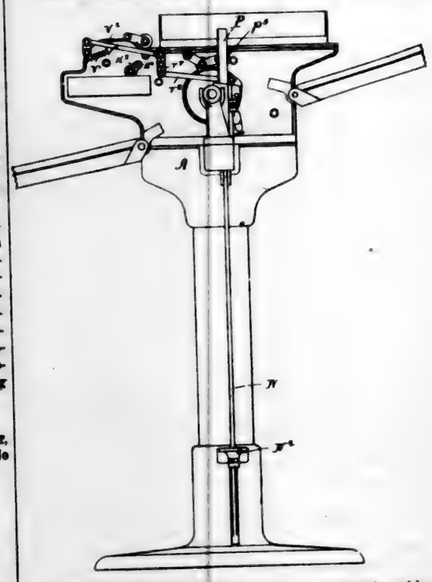
2. In a gas-mixing apparatus of the kind described the combination with a casing having air and gas inlets and an outlet for the mixed air and gas, of a drum with a series of adjacent peripheral chambers forming a cellular periphery, each chamber having a contracted tubular outer and inner portion overlapping the respective adjacent chambers, substantially as set forth.

3. In a gas-mixing apparatus of the kind described the combination with a casing having air and gas inlets and an outlet for the mixed air and gas, of a plurality of drums mounted upon a common shaft, each provided with a series of adjacent peripheral chambers forming separate cells with contracted tubular outer and inner extensions overlapping the respective adjacent chambers, the outer and inner tubular extensions of one drum extending in the opposite direction to those of the other drum, substantially as set forth.

4. A gas-mixing apparatus of the kind described comprising a casing with air and gas inlets, and an outlet for the mixed air and gas, a plurality of rotatory drums mounted upon a common shaft, each drum having a series of peripheral chambers with inner and outer walls concentric to the central shaft, with outer and inner tubular extensions extending in opposite directions and a peripheral casing connecting one drum to the other, substantially as and for the purpose described.

5. In a gas-mixing apparatus of the kind described, a casing provided with gas-inlets and an outlet for the mixed air and gas, a plurality of drums mounted upon a common shaft, each drum having a series of peripheral chambers with outer and inner tubular extensions extending in opposite directions, and a bell arranged over one of the drums and an outlet from said bell, substantially as described.

709,499. CAN-LABELING MACHINE. FRED C. MORRISON, Chicago, Ill. Filed Sept. 20, 1895. Serial No. 563,575. (No model.)



Claim.—1. In a can-labeling machine, the combination with a receptacle for the labels, of a feed-table, a paste pot or receptacle, an inclined track for the cans, a pair of reciprocating and rotating chuck-disks having tapering or bevel faces for lifting the cans from the can-track and rotating the same, stops for arresting the cans in position for being grasped by said chuck-disks, a track or guide for the labels, feed-rollers for the labels, a stop for arresting the movement of the label along its track, a grooved paste-roller for applying the paste in strips to the inner face of the label, a correspondingly-grooved pressure-roller for defleeting the label against the paste-roller, a grooved sealing-roller, a toothed spring guard or stripper fitting in and projecting through the grooves of the sealing-roller, a scraper for the paste-roller, and mechanism for operating said parts or devices, substantially as specified.

2. In a can-labeling machine, the combination with a track for the cans, and a sealing-roller, of a pair of reciprocating and rotating chuck-disks furnished with tapering or beveled faces to lift the cans from the can-track and into contact with the sealing-roller and rotate it upon its axis, substantially as specified.

3. In a can-labeling machine, the combination with the track for the cans and a sealing-roller, of a pair of reciprocating and rotating chuck-disks furnished with tapering or beveled faces for lifting the cans out of contact with the track and into contact with the sealing-roller and for grasping and rotating the can, and a pair of automatically-operating curved stop-arms, substantially as specified.

4. In a can-labeling machine, the combination with a can-track, of a pair of chuck-disks furnished with tapering or beveled faces to lift the can out of contact with the track and into contact with the sealing-roller and for grasping and rotating the can, a sealing-roller and a label-track doubled or reserved upon itself, feed-rollers and a paste-roller, substantially as specified.

5. In a can-labeling machine, the combination with a can-track and a pair of chuck-disks furnished with tapering or beveled faces to lift the can out of contact with the track and into contact with the sealing-roller and for rotating the can, of a grooved or sectional sealing-roller, and guard or stripping-fingers fitting in and projecting through the grooves of the sealing-roller, substantially as specified.

6. In a can-labeling machine, the combination with a pair of chuck-disks for rotating the can, of a grooved or sectional sealing-roller, and a guard or stripping-fingers fitting in and projecting through the grooves of the sealing-roller, said stripper-fingers projecting beyond the point of contact between the sealing-roller and the can, and curved so as to bear against the can and prevent the label winding around the sealing-roller, substantially as specified.

7. In a can-labeling machine, the combination with a pair of rotatable chucks for grasping and rotating the can, rollers for pasting the labels and feeding them to the can, mechanism for rotating the can connected with one of said chuck-disks, and mechanism for driving and rotating the feed and paste rollers connected to the other of said chuck-disks, so that the label feeding and pasting mechanism can only be driven when a can is present between the chuck-disks to communicate rotary motion from one to the other, substantially as specified.

8. In a can-labeling machine, the combination with a driven chuck-disk and a loose chuck-disk adapted to rotate with a can when the can is grasped between the chuck-disks, and a device for feeding the label and operating mechanism connecting it with the loose chuck-disk, so that the label will only be fed when the can is present, substantially as specified.

9. In a can-labeling machine, the combination with a track for the cans and a sealing-roller, of a pair of reciprocating and rotating chuck-disks furnished with tapering or beveled sockets for securing the can and lifting it from the can-track and into contact with the sealing-roller, and spring-ejector disks or plates to insure the proper discharge of the can from the chuck-disks to the track, substantially as specified.

10. In a can-labeling machine, the combination with a pair of rotating chuck-disks, of a track for the cans, a pair of movable stops to arrest the cans in the track, a spring for lifting the stops, a pawl for holding the stops retracted projecting into the path of the cans in the track, and provided with a cam or nose adapted to be engaged by a pin on the stop for moving the pawl, substantially as specified.

11. In a can-labeling machine, the combination with a paste-receptacle, of a grooved or sectional paste-roller and a grooved or sectional pressure-roller, the sections of the pressure-roller registering with the grooves of the paste-roller, and a track for the label having a series of lower guide-strips fitting in and projecting through the grooves of the paste-roller, said paste-roller being below the surface of said track, a track for the cans and a pair of revolving and reciprocating chuck-disks furnished with tapering or beveled faces to lift the can out of contact with the track and into contact with the pressure-roller, substantially as specified.

12. In a can-labeling machine, the combination with a paste-receptacle, of a grooved or sectional paste-roller and a grooved or sectional pressure-roller, the sections of the pressure-roller registering with the grooves of the paste-roller, a track for the label having a series of lower guide-strips fitting in and projecting through the grooves of the paste-roller, and having an upper guide with slots or openings cut through it for the disk or sections of the pressure-roller to project through said paste-roller being below the surface of said track, a track for the cans and a pair of revolving and reciprocating chuck-disks furnished with tapering or beveled faces to lift the can out of contact with the track and into contact with the pressure-roller, substantially as specified.

13. In a can-labeling machine, the combination with a paste-receptacle, of a grooved or sectional paste-roller and a grooved or sectional pressure-roller, the sections of the pressure-roller registering with the grooves of the paste-roller, a track for the label having a series of lower guide-strips fitting in and projecting through the grooves of the paste-roller, and having an upper guide with slots or openings cut through it for the disks or sections of the pressure-roller to project through, said paste-roller being below the label-track, and the pressure-roller being mounted movably so that a label may pass over said paste-roller without having paste applied thereto except when the pressure-roller is depressed, substantially as specified.

14. In a can-labeling machine, the combination with a paste-receptacle, of a grooved or sectional paste-roller and a grooved or sectional pressure-roller, the sections of the pressure-roller registering with the grooves of the paste-roller, a track for the label having a series of lower guide-strips fitting in and projecting through the grooves of the paste-roller, and having an upper guide with slots or openings cut through it for the disks or sections of the pressure-roller to project through, said paste-roller being below the label-track, and the pressure-roller being mounted movably so that a label may pass over said paste-roller, and means for automatically depressing said pressure-roller at intervals, substantially as specified.

15. In a can-labeling machine, the combination with the track for the cans, of rotating chuck-disks for revolving the cans furnished with bevel faces for lifting the cans out of contact with said can-track and into contact with the sealing-roller, a track for the labels, feed-rollers for feeding the labels along said track, a paste-pot, paste-roller and sealing-roller, and a movable frictional stop engaging the surface of the label for arresting the label in a certain position along said track before being applied to the can, substantially as specified.

16. In a can-labeling machine, the combination with the track for the cans, of rotating chuck-disks for revolving the cans furnished with bevel-faces for lifting the cans out of contact with said can-track and into contact with the sealing-roller, a track for the labels, feed-rollers for feeding the labels along said track, a paste-pot, paste-roller, and sealing-roller, and a movable frictional stop engaging the surface of the label for arresting the label in a certain position along said track before being applied to the can, one of said feed-rollers being movable to permit the movement of the label to be so stopped, substantially as specified.

17. In a can-labeling machine, the combination with the track for the cans, of rotating chuck-disks for revolving the cans furnished with bevel-faces for lifting the cans out of contact with said can-track and into contact with the sealing-roller, a track for the labels, feed-rollers for feeding the labels along said track, a paste-pot, paste-roller and sealing-roller, and a movable frictional stop engaging the surface of the label for arresting the label in a certain position along said track before being applied to the can, one of said feed-rollers being movable to permit the movement of the label to be so stopped, a vibratory yoke upon which said stop and feed-roller are mounted, and means for automatically vibrating said yoke, substantially as specified.

18. In a can-labeling machine, the combination with the track for the cans, of rotating chuck-disks for revolving the cans, a track for the labels, feed-rollers for feeding the labels along said track, a paste-pot, paste-roller and sealing-roller, and a movable stop for arresting the label in a certain position along said track before being applied to the can, one of said feed-rollers being movable to permit the movement of the label to be so stopped, a vibratory yoke upon which said stop and the feed-roller are mounted, means for automatically vibrating said yoke, a movable pressure-roller coöperating with said paste-roller, and means for automatically vibrating said pressure-roller, substantially as specified.

19. In a can-labeling machine, the combination with a track for the cans, of chuck-disks for rotating the cans and having bevel-faces for lifting the cans out of contact with said track and into contact with the sealing-roller, a grooved or sectional sealing-roller, a paste pot or receptacle, a grooved or sectional paste-roller, a sectional pressure-roller, and a curved spring-toothed stripper or guard projecting between the sections of the sealing-roller, substantially as specified.

20. In a can-labeling machine, the combination with a track for the cans of chuck-disks for rotating the cans and having bevel-faces for lifting the cans out of contact with said track and into contact with the sealing-roller, a grooved or sectional sealing-roller, a paste pot or receptacle, a grooved or sectional paste-roller, a sectional pressure-roller, a curved spring-toothed stripper or guard projecting between the sections of the sealing-roller, and two automatically-operated stops in the can-track for stopping the cans in position, substantially as specified.

21. In a can-labeling machine, the combination with a track for the cans, of chuck-disks for rotating the cans, a grooved or sectional sealing-roller, a paste pot or receptacle, a grooved or sectional paste-roller, a sectional pressure-roller, a curved spring-toothed stripper or guard projecting between the sections of the sealing-roller, a track for the labels, feed-rollers for the labels, and a movable stop for the labels, substantially as specified.

22. In a can-labeling machine, the combination with a track for the cans, of chuck-disks for rotating the cans, a grooved or sectional sealing-roller, a paste pot or receptacle, a grooved or sectional paste-roller, a sectional pressure-roller, a curved spring-toothed stripper or guard projecting between the sections of the sealing-roller, and two automatically-operated stops in the can-track for stopping the cans in position, a track for the labels, feed-rollers for the labels, and a movable stop for the labels, substantially as specified.

23. In a can-labeling machine, the combination with a track for the cans, and having bevel-faces for lifting the cans out of contact with said track and into contact with the sealing-roller, of chuck-disks for rotating

the cans, a grooved or sectional sealing-roller, a paste pot or receptacle, a grooved or sectional paste-roller, a sectional pressure-roller, a curved spring-toothed stripper or guard projecting between the sections of the sealing-roller, a track for the labels and feed-rollers for the labels, said track for the labels having a lower guide comprising a series of narrow strips or fingers registering with the grooves of the paste-roller, substantially as specified.

24. In a can-labeling machine, the combination with a track for the cans, of chuck-disks for rotating the cans, a grooved or sectional sealing-roller, a paste pot or receptacle, a grooved or sectional paste-roller, a sectional pressure-roller, a curved spring-toothed stripper or guard projecting between the sections of the sealing-roller, two automatically-operated stops in the can-track for stopping the cans in position, a track for the labels and feed-rollers for the labels, said track for the labels having a lower guide comprising a series of narrow strips or fingers registering with the grooves of the paste-roller, substantially as specified.

25. In a can-labeling machine, the combination with a track for the cans, of two reciprocating and rotating bevel-faced chuck-disks for lifting the can from the track and rotating the same, a reciprocating slide furnished with a cam to impart to the chuck-disks their reciprocating movement, and a reciprocating rack carried by said slide and having an independent reciprocating movement thereon for imparting to said chuck-disks their rotary movement whereby said chuck-disks are reciprocated or closed before being rotated, substantially as specified.

26. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F', of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2 and transverse slide Q^3 operated by said cam n and engaging said intermediate lever Q', substantially as specified.

27. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F', of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2 and transverse slide Q^3, and a spring Q^4 for retracting said chuck-disks, substantially as specified.

28. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F', of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2, transverse slide Q^3 operated by said cam n and engaging said intermediate lever Q', and springs f^{10} f^{10} inserted between said levers Q, Q, and their connection with the shafts of said chuck-disks, substantially as specified.

29. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F', of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2, transverse slide Q^3 operated by said cam n and engaging said intermediate lever Q', and a gear on the shaft of one of said chuck-disks engaging said rack P, substantially as specified.

30. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F', of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2, transverse slide Q^3 operated by said cam n and engaging said intermediate lever Q', and a gear on the shaft of one of said chuck-disks engaging said rack P, said rack P having a corner or projection engaging said transverse slide Q^3 to prevent movement of the rack P until after the transverse slide Q^3 has closed the chuck-disks, substantially as specified.

31. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F', of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2, transverse slide Q^3 operated by said cam n and engaging said intermediate lever Q', a gear on the shaft of one of said chuck-disks engaging said rack P, said transverse slide Q^3 being provided with a pawl q^3 and spring q^4, substantially as specified.

32. In a can-labeling machine, the combination with rotating and reciprocating chuck-disks F F' of operating-slide N, having a cam n, independently-reciprocating rack P carried by said slide N, levers Q Q connected to the shafts of said chuck-disks, intermediate lever Q', connecting-links Q^2 Q^2, transverse slide Q^3 operated by said cam n and engaging said intermediate lever Q', and a gear on the shaft of one of said chuck-disks engaging said rack P, said rack P having a corner or projection engaging said transverse slide Q^3 to prevent movement of the rack P until after the transverse slide Q^3 has closed the chuck-disks, said transverse slide Q^3 being provided with a pawl q^3 and spring q^4, and said rack P being provided with a pawl p^3 for engaging said pawl q^3 and tripping the same to release the chuck-disks and permit the same to separate to discharge the can before the rack P begins its backward movement, substantially as specified.

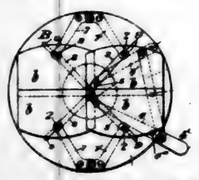
33. In a can-labeling machine, the combination with a can-track B of rotating and reciprocating chuck-disks F F', stops B' B^2, having rock-shafts b^2 b^2 provided with arms b^3 b^3 and connecting-link b^4, and a spring b^5 for automatically lifting the stops into position, sliding rack P having cam p^3, levers b^6 and b^{11}, locking-bolt b^9 carried by one of said levers and engaging the other and a cam b^{10} for operating said locking-bolt, substantially as specified.

34. In a can-labeling machine, the combination with a can-track B of rotating and reciprocating chuck-disks F F', stops B' B^2, having rock-shafts b^2 b^2 provided with arms b^3 b^3 and connecting-link b^4, and a spring b^5 for automatically lifting the stops into position, sliding rack P having cam p^3, levers b^6 and b^{11}, locking-bolt b^9 carried by one of said levers and engaging the other and a cam b^{10} for operating said locking-bolt, pawl b^{12} having springs b^{13}, a pin b^{17} on one of said stops engaged by said pawl b^{12}, said pawl projecting in the path of the cans so as to be tripped by their passage, substantially as specified.

35. In a can-labeling machine, the combination with a can-track B of rotating and reciprocating chuck-disks F F', stops B' B^2, having rock-shafts b^2 b^2 provided with arms b^3 b^3 and connecting-link b^4, and a spring b^5 for automatically lifting the stops into position, sliding rack P having cam p^3, levers b^6 and b^{11}, locking-bolt b^9 carried by one of said levers and engaging the other and a cam b^{10} for operating said locking-bolt, pawl b^{12} having spring b^{13}, a pin b^{17} on one of said stops engaged by said pawl b^{12}, said pawl projecting in the path of the cans so as to be tripped by their passage, and said pawl having a nose or cam b^{18} to cause said pin b^{17} to operate the pawl, substantially as specified.

36. The combination with a can-track of a movable stop for arresting the can, a spring for lifting the stop and a pawl projecting into the path of the can and adapted to be tripped by the can for holding said stop open or down, said pawl being provided with a cam or nose to cause the stop to turn or set the pawl, substantially as specified.

709,500. PHOTOGRAPHIC-SHUTTER MECHANISM. CHARLES A. MULLER, New York, N. Y. Filed Jan. 9, 1902. Serial No. 88,978. (No model.)



Claim.—1. In a shutter mechanism the combination with a plurality of overlapping shutter-sections each having the form of an elongated rectangle, three of whose interbearing sides are disposed substantially at right angles to each other of operating mechanism for rotating each of said shutter-sections.

2. In a shutter mechanism the combination with a plurality of shutter-sections mounted for combined angular and translational movement, of means for turning each of said sections and shifting the same bodily away from and toward the axis of the shutter-aperture.

3. In a shutter mechanism the combination with a plurality of shutter-sections mounted for combined angular and translational movement of means for turning each of said sections and simultaneously shifting the same first away from and then toward the axis of the shutter-aperture.

4. In a shutter mechanism the combination with a plurality of shutter-sections of operating mechanism movable from one position to another and back again for accomplishing during each of such forward and backward movements the opening and the closing of the shutter-aperture.

5. In a shutter mechanism, the combination with a shutter proper mounted for combined angular and translational movement, of operating mechanism movable from one position to another and back again for accomplishing during each of such forward and backward movements the turning and the bodily shifting of said shutter first away from, and then toward the shutter-aperture.

6. In a shutter mechanism, the combination with a shutter proper mounted for combined angular and translational movement, of an arm secured to the shutter, and mechanism operatively connected with the arm for turning the shutter about an axis and carrying it bodily to and fro.

7. In a shutter mechanism the combination with a pair of shutter-sections mounted for combined angular and translational movement of operating mechanism movable from one position to another and back again for accomplishing during each of such forward and backward movements the opening and closing of the shutter-aperture.

8. In a shutter mechanism the combination with a pair of shutter-sections mounted for combined angular and translational movement of operating mechanism movable from one position to another and back again for accomplishing during each of such forward and backward movements the turning and simultaneous bodily movement to and fro of each of said sections.

9. In a shutter mechanism the combination with a pair of shutter-sections of arms secured thereto and pivotally connected together and means for shifting the arms from one angular relation to another.

10. In a shutter mechanism the combination with a pair of shutter-sections of arms secured thereto and pivotally connected together, and a lever for shifting the arms from one angular relation to another.

11. In a shutter mechanism the combination with a pair of shutter-sections of arms secured thereto and pivotally connected together, and a lever for shifting the arms from one angular relation to another during each throw of the lever.

12. In a shutter mechanism the combination with a pair of shutter-sections of arms secured thereto and pivotally connected together, means for shifting the arms from one angular relation to another, and means for guiding the sections during their movements.

13. In a shutter mechanism the combination with a pair of shutter-sections of arms secured thereto and pivotally connected together, a lever for shifting the arms from one angular relation to another, and means for guiding the sections during their movements.

14. In a shutter mechanism the combination with a pair of shutter-sections of arms secured thereto and pivotally connected together, a lever for shifting the arms from one angular relation to another during each throw of the lever, and means for guiding the sections during their movements.

15. In a shutter mechanism, the combination with a pair of shutter-sections of jointed angularly-disposed arms secured thereto, a pair of articulated levers for guiding the sections during their movements, and an operating-lever for bringing said arms into alinement with each other and reversing their angular relation during each throw of the operating-lever.

16. In a shutter mechanism, the combination with a pair of shutter-sections of jointed angularly-disposed arms secured thereto, a pair of articulated levers for guiding the sections during their movements, and an operating-lever for bringing said arms into alinement with each other and reversing their angular relation during each throw of the operating-lever, and a supporting-plate upon which the parts are mounted.

17. In a photographic shutter, the combination with oppositely-disposed pairs of shutter-sections of angularly-disposed arms secured to the sections and pivotally connected together in pairs and means for bringing the jointed arms of each pair into alinement with each other and reversing their angular relation during a continuous movement of said operating means.

18. In a photographic shutter, the combination with oppositely-disposed pairs of shutter-sections of angularly-disposed arms secured to the sections and pivotally connected together in pairs and operating-levers for bringing the jointed arms of each pair into alinement with each other and reversing their angular relation during a continuous throw of said operating-levers.

19. In a photographic shutter, the combination with oppositely-disposed pairs of shutter-sections of jointed angularly-disposed pairs of arms secured to the sections, articulated levers for guiding the sections during their movements and compelling their simultaneous action, and operating-levers for bringing the jointed arms of each pair into alinement with each other and reversing their angular relation during the continuous throw of said operating-levers.

20. In a photographic shutter, the combination with oppositely-disposed pairs of shutter-sections of jointed angularly-disposed pairs of arms secured to the sections, articulated levers for guiding the sections during their movements and compelling their simultaneous action, and operatively-connected operating-levers connected to said pairs of jointed arms for bringing each pair of arms into alinement with each other and reversing their angular relation during each throw of said operating-levers.

21. In a photographic shutter, the combination with oppositely-disposed pairs of shutter-sections having projecting pins, of jointed angularly-disposed pairs of arms secured to said pins, articulated levers for guiding the sections during their movements and compelling their simultaneous action, and operatively-connected operating-levers connected to said pairs of jointed arms for bringing each pair of arms into alinement with each other and reversing their angular relation during each throw of said operating-levers, and a supporting-plate upon which the parts are mounted and through which said pins extend.

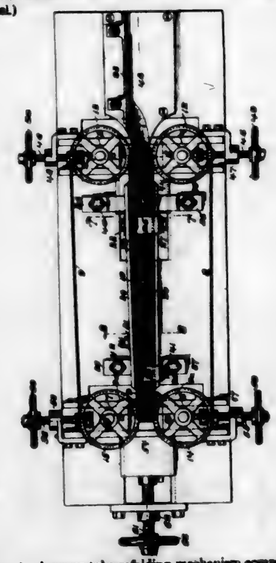
22. In a photographic shutter, the combination with oppositely-disposed pairs of shutter-sections, of angularly-disposed arms secured to the sections and pivotally connected together in pairs, and operating means for simultaneously bringing the jointed arms of each pair into alinement with each other and reversing their angular relation during the continuous movement of each operating means.

23. In a photographic shutter, the combination with a plurality of shutter-sections, of angularly-disposed arms secured to the sections and pivotally connected together in pairs; operating-levers, one for each pair of jointed arms, for bringing the arms of the pair into alinement with each other and reversing their angular relation during a continuous throw of the connected operating-lever; and a link connecting said levers.

24. In a photographic shutter, the combination with a plurality of shutter-sections of angularly-disposed arms secured to the sections and pivotally connected together in pairs; operating-levers, one for each pair of jointed arms, for bringing the arms of the pair into alinement with each other and reversing their angular relation during a continuous throw of the connected lever; and a link extending from each operating-lever to the corresponding pair of arms.

25. In a photographic shutter, the combination with a plurality of shutter-sections of angularly-disposed arms secured to the sections and pivotally connected together in pairs; operating-levers, one for each pair of jointed arms, for bringing the arms of the pair into alinement with each other and reversing their angular relation during a continuous throw of the connected lever; a link extending from each lever to the joint between the corresponding pair of arms; and a link connecting said levers.

709,501. MACHINE FOR REFOLDING PAPER TUBES. HARVEY S. MUNSON, New Haven, Conn. Filed Aug. 4, 1896. Serial No. 601,690. (No model.)



Claim.—1. A paper-tube-refolding mechanism comprising side carrying-belts, whose planes of travel gradually approach from their receiving to their delivering points, and opposed guides, the planes of whose bearing-faces gradually separate from their receiving to their delivering points, whereby the space within which the tube is compelled to travel is gradually contracted in one direction and expanded in the other, and strains are exerted upon the tube that cause its plies to move laterally upon its folding-lines and transform it from a flat or collapsed condition, into a hollow or distended one, substantially as described.

2. A paper-tube refolding mechanism comprising side carrying-belts, whose planes of travel gradually approach from their receiving to their delivering points and which diverge edgewise, and opposed guides, the planes of whose bearing-faces gradually separate from their receiving to their delivering points, whereby the space in which the tube is compelled to travel is gradually contracted in one direction as widthwise and expanded in the other direction, and one edge of the tube is moved out of the plane in which the other edge travels and strains are exerted upon it that cause its plies to move laterally upon its folding-lines and transform it from a flat or collapsed condition, into a hollow or distended one, substantially as described.

3. A paper-tube-refolding mechanism comprising side carrying-belts,

whose planes of travel gradually approach from their receiving to their delivering points, opposed guides, the planes of whose bearing-faces gradually separate from their receiving to their delivering points, whereby the space in which the tube is compelled to travel is gradually contracted in one direction and expanded in the other and strains are exerted upon the tube that cause its plies to move laterally upon its folding-lines and transform it from a flat or collapsed condition, into a hollow or distended one, and bearers holding the belts to duty against distortion, substantially as described.

4. A paper-tube-refolding mechanism comprising side carrying-belts, whose planes of travel gradually approach from their receiving to their delivering points, and opposed guides the planes of whose bearing-faces gradually separate from their receiving to their delivering points, whereby the space in which the tube is compelled to travel is gradually contracted in one direction as widthwise and expanded in the other direction, and strains are exerted upon the tube that cause its plies to move laterally upon its folding-lines and transform it from a flat or collapsed condition, into a hollow or distended one, one or both of said guides being provided with inward extensions at their delivering ends to impart an extra bend to the innermost foldings, substantially as described.

5. A paper-tube-refolding mechanism having side carrying-belts whose relative planes of travel gradually approach from their receiving to their delivering points, and opposed longitudinal guides whereby the tube is directed, said guides having outwardly-inclined ends to direct the tube to the belts, substantially as described.

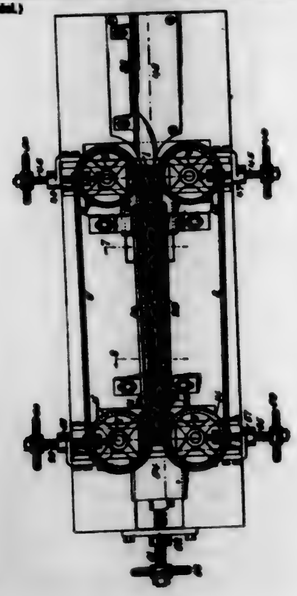
6. In a paper-tube-refolding mechanism in which the tube is contracted widthwise between propelling-surfaces, a feeding-table having an inclined front end to admit of downward expansion or bulge of the tube, substantially as described.

7. In a paper-tube-refolding mechanism, the combination with pulleys 12, 14 and 13, 15 and side carrying belts supported thereby, of means for adjusting said pulleys to move the opposed faces of the belts toward or from each other, substantially as described.

8. In a paper-tube-refolding mechanism, the combination with pulleys 12, 14 and 13, 15, side carrying-belts supported thereby, and opposed guides, of means for adjusting said pulleys to move the opposed faces of the belts toward or from each other and for adjusting said guides toward or from each other, substantially as described.

9. In a paper tube-refolding mechanism, the combination with pulleys 12, 14 and 13, 15, side carrying-belts supported thereby and bearers for the belts, of means for adjusting said pulleys and bearers to move the opposed faces of the belts toward or from each other, substantially as described.

709,502. MACHINE FOR REFOLDING PAPER TUBES. HARVEY S. MINNOR, New Haven, Conn. Filed Aug. 4, 1898. Serial No. 687,700. (No model.)

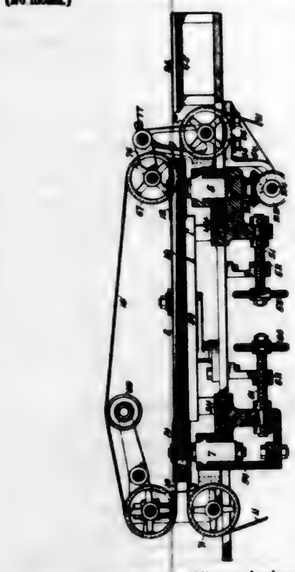


Claim.—1. A paper-tube-refolding mechanism comprising side carrying-belts whose planes of travel gradually approach from their receiving to their delivering points and which diverge edgewise, whereby one edge of the longitudinally-creased tube is moved out of the plane in which the other edge travels, and strains are exerted on the tube that cause it to travel onward and to be gradually contracted widthwise and enlarged in the other direction and thus become folded on its creased lines, and transform it from a flat or collapsed condition to a hollow or distended one, substantially as described.

2. A paper-tube-refolding mechanism comprising grooved side carrying-belts whose planes of travel gradually approach from their receiving to their delivering points with which are combined short opposed guides that gradually separate from their receiving to their delivering points, whereby the space in which the tube is compelled to travel is gradually contracted widthwise and expanded in the other direction and strains are exerted on the tube that cause its plies to move laterally upon its folding-lines and transform it from a flat or collapsed condition into a hollow or distended one, substantially as described.

3. In a paper-tube-refolding mechanism, the combination with grooved side carrying-belts, of pulleys 12, 14 and 13, 15 supporting said belts and provided with means for adjustment, substantially as described.

709,503. MACHINE FOR REFOLDING PAPER TUBES. HARVEY S. MINNOR, New Haven, Conn. Filed Aug. 4, 1898. Serial No. 687,701. (No model.)



Claim.—1. A paper-tube-refolding mechanism comprising side belts whose planes of travel gradually approach from their receiving to their delivering points, and opposed top and bottom belts whose planes of travel gradually separate from their receiving to their delivering points, whereby the space within which the tube is compelled to travel is gradually contracted in one direction and expanded in the other, and strains are exerted on the tube that cause its plies to move laterally upon its folding-lines and transform it from a flat or collapsed condition into a hollow or distended one, substantially as described.

2. A paper-tube-refolding mechanism comprising side belts whose planes of travel gradually approach from their receiving to their delivering points and which diverge edgewise, and opposed top and bottom belts the planes of whose bearing-faces gradually separate from their receiving to their delivering points, whereby the space within which the tube is compelled to travel is gradually contracted in one direction and expanded in the other, and one edge of the tube is moved out of the plane in which the other edge travels, and strains are exerted on the tube that cause its plies to move laterally on its folding-lines and transform it from a flat or collapsed condition into a hollow or distended one, substantially as described.

3. A paper-tube-refolding mechanism comprising side belts whose planes of travel gradually approach from their receiving to their deliver-

ing points, opposed top and bottom belts the planes of whose bearing-faces gradually separate from their receiving to their delivering points, whereby the space within which the tube is compelled to travel is gradually contracted in one direction and expanded in the other, and strains are exerted upon the tube that cause its plies to move laterally on its folding-lines and transform it from a flat or collapsed condition into a hollow or distended one, and bearers holding one or both sets of belts to duty against distortion, substantially as described.

4. A paper-tube-refolding mechanism comprising side belts whose planes of travel gradually approach from their receiving to their delivering points, opposed top and bottom belts, the planes of whose bearing-faces gradually separate from their receiving to their delivering points, and an elastic bearing for the carrying-pulley for the delivery end of the top belt, substantially as described.

5. A paper-tube-refolding mechanism comprising side belts whose planes of travel gradually approach from their receiving to their delivering points, opposed top and bottom belts, the planes of whose bearing-faces gradually separate from their receiving to their delivering points, and adjustable arms for supporting the carrying-pulley for the receiving end of the top belt whereby the space for the tube between the pulleys of the top and bottom belt at the entrance-point may be adjusted, substantially as described.

709,504. CONDUIT. WILLIAM L. MCGOWAN, Philadelphia, Pa. Filed Feb. 8, 1902. Serial No. 93,120. (No model.)

Claim.—1. A conduit-section consisting of a tubular body having one end provided with a projection and the other end with a complementary recess, the highest point of the projection and the lowest point of the recess being located at different distances from the median line of the tubular body.

2. A conduit-section consisting of a tubular body having an end provided with a projection the highest point of which is out of the median line of the body.

3. A conduit-section consisting of a tubular body having an end provided with a recess the lowest point of which is out of the median line of the body.

4. A conduit-section consisting of a tubular outer body having longitudinal partitions or walls dividing it internally into a series of longitudinal ducts, said partition-walls at one end being extended beyond the ends of the walls of the outer body to form a projection composed of said partitions, the highest point of said projection being out of the median line of the tubular body.

5. A conduit-section consisting of a tubular outer body having longitudinal partitions or walls dividing it internally into a series of longitudinal ducts, said partition-walls at one end being abbreviated or terminated within the outer body at a distance from the end thereof, to form a recess between the ends of the partition and the ends of the outer body, the lowest point of said recess being out of the median line of the tubular body.

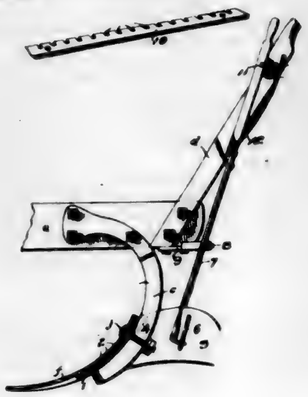
6. A conduit composed of tubular sections, the end of one section being provided with a projection and the end of the adjacent section having a complementary recess in which the projection of the other section fits, the highest point of the projection and the lowest point of the recess being relatively a different distance from the median line of the sections, whereby one section is caused to assume an angular inclination with reference to the other.

709,505. WING ATTACHMENT FOR PLOWS. GEORGE H. HOOPER, Dahlonega, Ga. Filed Mar. 18, 1902. Serial No. 98,410. (No model.)

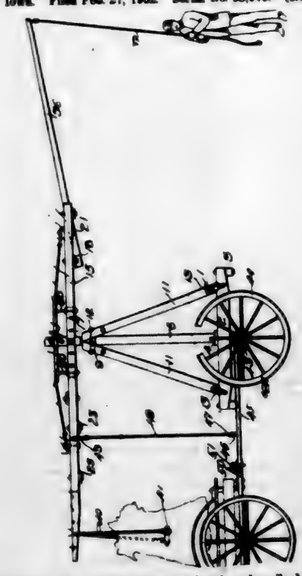
Claim.—1. In combination with the standard and tongue or shovel of a plow, a foot-plate fitted and vertically adjustable between them and having a hinged wing, and an adjusting-lever connected to the wing, substantially as described.

2. In combination with a plow of the class described, a foot-plate detachably fitted and vertically adjustable between the standard and tongue or shovel and having a hinged wing, an adjusting-lever connected to the wing, and means to lock the lever and thereby cause the same to secure the wing when adjusted, substantially as described.

3. A foot-plate adapted to be detachably secured between the tongue or shovel and standard of a plow, in combination with a wing hinged to the foot-plate, a lever connected to the wing, a rack-bar between the handles to engage and secure the lever when adjusted and a fulcrum for said lever adapted to be detachably secured to the beam of the plow, substantially as described.



709,506. FODDER-LOADER. CHARLES L. PACKER, Wilton Junction, Iowa. Filed Feb. 27, 1902. Serial No. 96,979. (No model.)



Claim.—1. In a fodder-loader of the class described, the combination of a base-frame having a bearing, brace-bars secured to the base-frame and having their upper ends secured together and provided with a bearing-opening formed directly in their inner opposing sides, a revolvable post having its lower end journaled in the base-bearing, and having a cylindrical neck near its upper end journaled also in the bearing-opening in the upper ends of the brace-bars, and a beam pivotally connected to the upper portion of the post, substantially as described.

2. In a fodder-loader, the combination of a post mounted for revolution, a beam pivotally connected to the post, and comprising side bars and cross-blocks connecting them, on their upper and lower sides, and a lever-bar and extension-arm adapted to be inserted between the bars and blocks at the opposite ends of the beam, and to be unshipped therefrom, substantially as described.

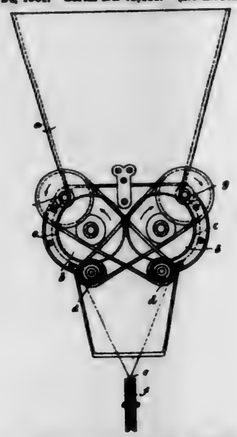
3. In a fodder-loader a pivoted beam comprising side bars, having cross-blocks secured on and under the bars at and near the ends of the beam, and a truss on its upper side having an element connected to the upper cross-blocks, in combination with a lever-bar having its inner end

inserted between the side bars and cross-blocks at one end of the beam and provided with a truss-rod, the inner end of the latter being detachably secured to one of the cross-blocks.

4. In a fodder-loader, a pivoted beam comprising side bars, spacer-blocks between the same and secured thereto near the center of the beam, cross-blocks under the bars at and near the ends thereof, cross-blocks on the bars and intermediate of the first-mentioned cross-blocks, links on the upper cross-blocks, bolts securing said links to said cross-blocks and the latter to the bars, a strut-link, bolts engaging the spacer-blocks and supporting the strut-link above the center of the beam, and rods attached to the links and adjustably connected to the ends of the strut-link, substantially as described.

5. In a fodder-loader, a pivoted beam comprising side bars and having cross-blocks secured on and under the bars at and near the ends of the beam, in combination with a lever-bar having its inner end inserted between the side bars and cross-blocks at one end of the beam and provided with a truss-rod, the inner end of the latter being detachably secured to one of the cross-blocks, substantially as described.

709,507. DEVICE FOR FEEDING TOBACCO IN CIGARETTE-MACHINES. JOSEF PASL, Dresden-Striesen, Germany, assignor to Fabrikenbesitzer G. Calberla, G. H. B. H., Dresden, Saxony, Germany. Filed Aug. 24, 1901. Serial No. 73,189. (No model.)



Claim.—1. A tobacco-feed device for cigarette-making machines, comprising in combination a hopper, two oppositely-rotating toothed rollers at the lower end of said hopper which rotate at the same speed, and two smaller toothed rollers adapted to remove the tobacco from the first rollers and thoroughly mix the same, substantially as set forth.

2. A tobacco-feed device for cigarette-making machines, comprising in combination, a hopper, two oppositely-rotating toothed rollers at the lower end of said hopper which rotate at the same speed, two smaller toothed rollers adapted to remove the tobacco from the first rollers and thoroughly mix the same, and rollers, one in contact with each of the first-named rollers and adapted by quickly rotating to prevent the passage of too much tobacco, substantially as set forth.

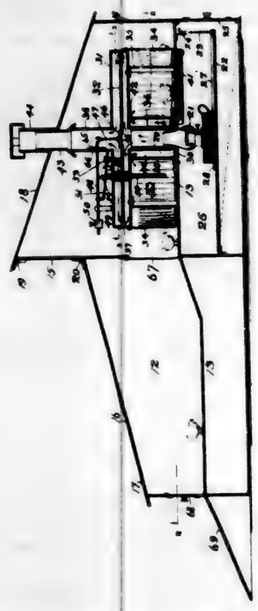
709,508. CHICKEN-BROODER. NILS PEDERSEN, Joliet, Ill., assignor to himself and Frederick C. Wilmz, Joliet, Ill. Filed Sept. 9, 1901. Serial No. 74,726. (No model.)

Claim.—1. The brooder provided with an overhead heater having a single outlet for the gases, &c., from the lamp, and also having both a direct and an indirect passage from the lamp to said flue, together with means for automatically determining which of said passages said gases shall take, substantially as specified.

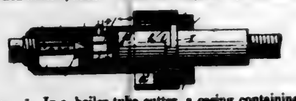
2. The brooder provided with an overhead heater having a single outlet for gases, &c., from the lamp, and also having both a direct and an indirect passage from the lamp to said outlet, together with means for closing the direct passage automatically whenever the temperature falls too low in the brooding-chamber, substantially as specified.

3. In a brooder, a movable top 18 through which the chimney extends and carrying the loose pipe-section 43 flanged outwardly at its bottom, in combination with a stationary chimney-section 38 with which the pipe-section 43 offsets a junction when the cover is closed, substantially as specified.

4. In a brooder, a movable top 18 carrying the chimney-top 44 and a telescoping pipe-section 43 having its bottom flanged outwardly, in combination with a stationary chimney-section 38, substantially as specified.



709,509. BOILER-TUBE CUTTER. JOHN H. POLLARD, Centralia, Ill. Filed June 4, 1902. Serial No. 110,222. (No model.)



Claim.—1. In a boiler-tube cutter, a casing containing the cutting mechanism, the end of said casing formed with a slanting surface, and cutting-facets on said slanting surface, substantially as shown and described.

2. In a boiler-tube cutter, a casing formed with two communicating chambers, one chamber containing the cutting device, the other chamber containing oil and a screw-plug valve inserted in a screw-threaded bore in the end of the casing, substantially as shown and described.

3. In a boiler-tube cutter, a casing formed with two chambers by a partition having a valve-port, one of said chambers containing the cutting device, the other chamber containing oil, and a screw-plug valve inserted in a screw-threaded bore in the end of said casing having a head to register with said valve-port to control the flow of oil to the cutting-blade, substantially as shown and described.

4. In a boiler-tube cutter, a spindle having a recess in its end provided with a circular journal-bearing, a cutting-blade having a heavy body portion and a narrow cutting edge, one side of said body portion having an angular face, the other side having a recess therein, the base of the recess on said spindle having a surface to bear against the angular surface of said body portion in projecting the blade, and with a part to fit into the recess on the other side of the blade, substantially as shown and described.

5. In a boiler-tube cutter, the combination of a casing having two chambers separated by a valved partition and a slot in the wall of one chamber, a spindle rotatably mounted in said slotted chamber, a cutting-blade journaled on said spindle, and means to force the cutting-blade out of said slot and return it to its normal position, substantially as shown and described.

6. In a boiler-tube cutter, the combination of a casing having two chambers therein separated by a valved partition, one of said chambers having a slot in its wall, a spindle rotatably mounted in said slotted chamber, a cutting-blade journaled in said spindle, said cutting-blade having an angular edge and a recessed edge, and the spindle formed to bear against said angular edge to project the blade, and to fit into said recess to retract it, substantially as shown and described.

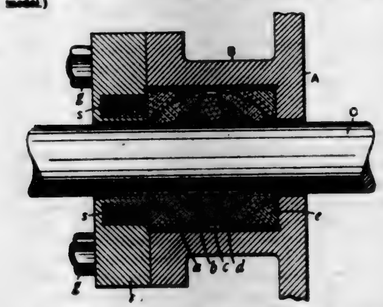
7. In a boiler-tube cutter, a casing having two chambers separated by a valved partition, a spindle rotatably mounted in one of said chambers, a cutting-blade journaled in the end thereof, a shoulder on said spindle, a clutch on said shoulder, a union fitting said spindle and shoulder and secured to the edge of the casing, and a lug on said union against which said clutch bears to turn the casing in cutting a tube, substantially as shown and described.

8. In a boiler-tube cutter, a spindle having a recess in its end provided with a journal-bearing, a cutting-blade mounted in said recess having a head to fit into said journal-bearing, a casing having two chambers separated by a valved partition, one of said chambers adapted to receive the end of said spindle and having a slot through which said cutting-blade extends in cutting a tube, an annular shoulder on said spindle, a clutch on said shoulder, a union fitting said spindle and shoulder and secured to the edge of the casing, and a lug on said union against which said clutch bears to turn the casing in cutting a tube, substantially as shown and described.

709,510. GIB-AND-KEY DEVICE. CHARLES B. PEET, New London, Ohio. Filed Apr. 26, 1902. Serial No. 104,866. (No model.)

Claim.—The combination with a shaft and inclosing sleeve or hub of a dog diagonally passing through said hub or sleeve and means for adjustably securing said dog in engagement with the shaft, consisting of a longitudinally-adjustable screw passing through said hub and dog, substantially as described.

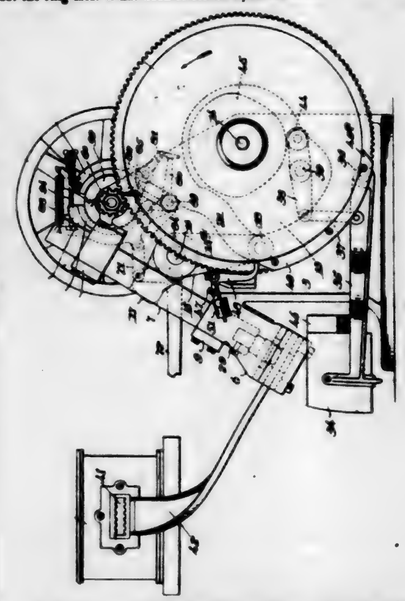
709,511. PACKING FOR STUFFING-BOXES. PERCY REDFORD, Manchester, England. Filed July 3, 1901. Serial No. 66,972. (No model.)



Claim.—A stuffing-box packing comprising a spherical structure made up of two hemispherical hollow parts and a separate core confined between them, an axial passage leading through the core and said parts, in combination with two rings having internal spherical surfaces embracing the opposite sides of the spherical structure and having openings in line with said passage, and means for forcing said rings toward each other to thereby press the hollow hemispherical parts against the core, substantially as described.

709,512. MECHANISM FOR TRUING SPINNING-RINGS. CHARLES F. ROPER, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Jan. 9, 1902. Serial No. 88,976. (No model.)

Claim.—1. In an organized machine for truing spinning-rings, the following instrumentalities viz: an arber adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the ring, means to support the ring while the arber is being inserted therein, arber-reciprocating mechanism, and mechanism operating automatically to cool the ring after it has been stretched upon the arber.



2. In an apparatus for truing spinning-rings, an arber adapted to be inserted into the ring, and having a cylindrical portion of the diameter desired for the interior of the ring, means to support the ring while the arber is being inserted therein, arber-reciprocating mechanism, arber-reciprocating mechanism and means independent from the arber-reciprocating mechanism to immerse the ring in a cooling-bath after it has been stretched upon the arber.

3. In an apparatus for truing spinning-rings, an arber adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support for the ring operating to hold the latter in fixed position while the arber is being inserted therein, arber-reciprocating mechanism, and means to cool the ring while stretched upon the arber and during the time that it is sustained by the support.

4. In a machine for truing spinning-rings, an arber adapted to be inserted into a spinning-ring and having a cylindrical portion of the diameter desired for the interior of the ring, a seat to support the spinning-ring, arber-reciprocating mechanism, and means separate from the latter to immerse said ring in a cooling-bath when stretched upon the arber.

5. In an apparatus for truing spinning-rings, an arber adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain a ring in fixed position, arber-reciprocating mechanism, the movement of the arber toward the support operating to force the arber into the ring, means to cool the ring when stretched upon the arber, and means to strip the ring from the arber during the backward movement of the latter.

6. In an apparatus for truing spinning-rings, a support to sustain a spinning-ring, an arber adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, arber-reciprocating mechanism, the movement of the arber toward the support operating to force the arber into the ring, means to cool the ring when stretched upon the arber, and means independent from the support to strip the ring from the arber during the backward movement of the latter.

7. In an apparatus for truing spinning-rings, a suitable frame, arber-reciprocating mechanism carried thereby, an arber detachably connected to said arber-reciprocating mechanism, a support for the ring detachably carried by the frame, the movement of the arber toward the support operating to force the arber into the ring, and means separate from the arber-reciprocating mechanism to immerse the ring in a cooling-bath while it is stretched upon the arber.

8. In a machine for truing spinning-rings, a suitable frame, arber-reciprocating mechanism, an arber detachably connected therewith, a support for the ring removably carried by the frame, the movement of the arber toward the support operating to force the arber into the ring, means to cool the ring when stretched upon the arber, and means to strip the ring from the arber as the latter recedes from the support.

9. In a mechanism for truing spinning-rings, a reciprocating arbor adapted to be inserted into a spinning-ring, and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring, means to center the ring on the support in position to receive the arbor, said means being independent from the support and arbor-reciprocating mechanism.

10. In a mechanism for truing spinning-rings, a reciprocating arbor adapted to be inserted into a spinning-ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring in fixed position, devices to center the ring on the support in position to receive the arbor, arbor-reciprocating mechanism, the arbor in its movement toward the support being forced into the ring, and means to cool the ring while stretched upon the arbor.

11. In a machine for truing spinning-rings, a reciprocating arbor adapted to be inserted into a ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring in a fixed position, devices to center the ring on the support in position to receive the arbor, arbor-reciprocating mechanism, the arbor in its movement on the support being forced into the ring, means to cool the ring while stretched upon the arbor, and means to strip the ring from the arbor as the latter recedes from the support.

12. In an apparatus for truing spinning-rings, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring while the arbor is being inserted therein, arbor-reciprocating mechanism, means to cool the ring when stretched upon the arbor, and means independent from the support to strip the ring from the arbor during the retrograde movement of the latter.

13. In an apparatus for truing spinning-rings, an arbor adapted to be inserted into a ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring while the arbor is being inserted therein, means independent from the support to center the ring thereon in position to receive the arbor, arbor-reciprocating mechanism, and means independent from the support to strip the ring from the arbor during the retrograde movement of the latter.

14. In an apparatus for truing spinning rings, an arbor adapted to be inserted into the ring, and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring while the arbor is being inserted therein, means independent from the support to center the ring, and means to cool the ring when stretched upon the arbor.

15. In a mechanism for truing spinning-rings, a reciprocating arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, a support to sustain the ring, means to center the ring on the support in position to receive the arbor, said means including a removable stop, arbor-reciprocating mechanism, the arbor in its movement toward the support being forced into the ring, means to strip the ring from the arbor during the receding movement of the latter, and means acting simultaneously to withdraw the stop from the path of the ring whereby the finished ring passes off from the support.

16. In a mechanism for truing spinning-rings, an arbor adapted to be inserted into the ring and moving in an inclined path, said arbor having a cylindrical portion of the diameter desired for the interior of the ring, an inclined support to sustain the ring in the path of movement of the arbor, arbor-reciprocating mechanism, the arbor during its reciprocation being forced into the ring, and means to strip the ring from the arbor during the backward movement of the latter, the inclined position of the parts allowing the finished ring to be discharged from the support by gravity.

17. In a mechanism for truing spinning-rings, an arbor adapted to be inserted into the ring and moving in an inclined path, such arbor having a cylindrical portion of the diameter desired for the interior of the ring, an inclined support to sustain said ring in the path of movement of the arbor, means to properly position said rings on the support to receive the arbor, said means including a removable stop, arbor-reciprocating mechanism, the arbor during its movement toward the support being forced into the ring, means to strip the ring from the arbor when the latter recedes from the support, and means to simultaneously remove the back-stop from the path of the ring, the inclined position of the parts allowing the finished ring to be discharged from the support by gravity.

18. In an apparatus for truing spinning-rings, an arbor adapted to be inserted into the ring and moving in an inclined path, said arbor having a cylindrical portion of the diameter desired for the interior of the ring, an inclined support to sustain said ring in the path of movement of the arbor, centering devices to properly position the ring on the support to receive the arbor, arbor-reciprocating mechanism, the arbor during its movement toward the ring being forced into the latter, a pan containing a cooling-bath and situated beneath the support, means to raise said pan to immerse the ring in the cooling-bath, and means to strip the ring from the arbor as the arbor recedes from the support.

19. In a mechanism for truing spinning-rings, an arbor adapted to be inserted into the ring and moving in an inclined path, such arbor having a cylindrical portion of the diameter desired for the interior of the ring, an inclined support to sustain said ring in the path of movement of the arbor, means to properly position said ring on the support to receive the arbor, said means including a removable stop, arbor-reciprocating mechanism, the arbor during its movement toward the support being forced into the ring, a pan containing a cooling-bath and situated beneath the support, means to raise said pan to immerse the ring in the cooling-bath, means to strip the ring from the arbor as the arbor recedes from the support, and means to simultaneously remove the stop from the path of the ring, the inclined position of the parts allowing the finished ring to be discharged from the support by gravity.

20. In a machine for truing spinning-rings, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, means to force said arbor into a ring, means to hold the ring in fixed position while the arbor is being inserted therein, means to cool the ring when stretched upon the arbor, and means to strip the ring from the arbor, combined with means acting automatically to stop the operation of the machine when the above-named cycle of operations has been completed.

21. In a machine for truing spinning-rings, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, devices to force the arbor into the ring, means to hold the ring in a fixed position while the arbor is being inserted therein, devices to cool the ring when stretched on the arbor, and devices to strip the ring from the arbor after the ring has been cooled, a driving-shaft operatively connected with each of said devices, a clutch mechanism by means of which said driving-shaft is rotated, and means to automatically render said clutch inactive after a complete cycle of operations has been performed.

22. In a mechanism for rehardening spinning-rings, a support to receive the ring to be treated, an arbor, arbor-reciprocating mechanism including a rotating cam device, the arbor in its movement toward the support being forced into the ring, a pan beneath the support, said pan adapted to receive a cooling-bath, cam devices rotating in unison with the first-named cam device, and operating to elevate the pan to immerse the ring therein while said ring is stretched over the arbor, means to rotate said cam devices, and means acting automatically to stop the rotation thereof when said cam devices have made one complete revolution.

23. In a mechanism for rehardening spinning-rings, a stationary support, a reciprocating arbor-carrier, an arbor secured thereto, an operating-lever engaging said carrier, a cam mechanism coöperating with said lever, and through the lever causing the arbor to be reciprocated, the arbor in its movement toward the support being forced into the ring, an oscillating arm carrying a pan at one end adapted to contain a cooling-bath, and a cam controlling the movement of said arm, the construction being such that after the arbor has been forced into the ring, the pan is raised to immerse the ring in the cooling-bath.

24. In a mechanism for rehardening spinning-rings, a stationary support, a reciprocating arbor-carrier, an arbor secured thereto, an operating-lever engaging said carrier, a cam mechanism coöperating with said lever, and through the lever causing the arbor to be reciprocated, the arbor in its movement toward the support being forced into the ring, an oscillating arm carrying a pan at one end adapted to contain a cooling-bath, a cam controlling the movement of said arm, and a stripper-plate situated above the support and having an aperture through which the arbor passes in its reciprocation, the construction of these devices being such that after the arbor has been forced into the ring, the pan is raised to immerse the ring in the cooling-bath, and as the arbor recedes from the support, the ring is brought against the stripper-plate and stripped from the arbor.

25. In a mechanism for rehardening spinning-rings, a frame, a stationary support detachably secured thereto, an arbor-carrier, an arbor detachably secured to said carrier, an actuating-lever engaging said carrier, a pan beneath the support, and adapted to contain a cooling-bath, an oscillating arm to which said pan is connected, and cam mechanism for actuating said lever and arm respectively, whereby the arbor and pan are moved toward and from the support, the construction being such that the arbor is forced into the ring as it moves toward the support, and the ring is immersed in the cooling-bath while stretched over the arbor.

26. In an apparatus for truing spinning-rings, a support adapted to sustain a ring, an arbor, an arbor-reciprocating lever, a pan to contain a cooling-bath, an oscillating lever or arm supporting said pan, rotating cam devices for actuating said lever and arm respectively, and means acting automatically to stop the rotation of the cam devices when they have made a complete rotation.

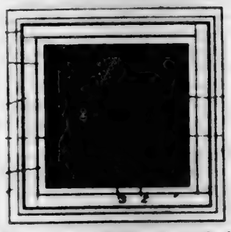
27. In apparatus for truing spinning-rings, an inclined support, a chute to deliver a ring to said support, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, means to reciprocate said arbor, said arbor in its movement toward the support being forced into the ring, a pan to contain a cooling-bath, said pan being situated beneath the support, means to raise the pan and immerse the ring in the bath while the said ring is stretched over the arbor, means to strip the ring from the arbor as the latter recedes from the support, and a chute to receive the ring as it is discharged from the inclined support by gravity.

28. In an apparatus for truing spinning-rings, a support to sustain a ring, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, automatic means to move one of said parts toward the other whereby the arbor is forced into the ring, devices separate from said automatic means to immerse the ring in a cooling-bath while stretched upon the arbor.

29. In an apparatus for truing spinning-rings, a support to sustain a spinning-ring, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, automatic means to move one of said parts toward and from the other, the arbor being forced into the ring during the relative movement of the parts toward each other, means operating automatically to cool the ring when stretched upon the arbor, and means independent from the support to strip the ring from the arbor as the arbor and support are separated from each other.

30. In an apparatus for truing spinning-rings, a frame, an inclined supporting-plate therein, having an aperture, an arbor adapted to be inserted into the ring and having a cylindrical portion of the diameter desired for the interior of the ring, means to give said arbor and supporting-plate a relative movement toward and from each other, the arbor being forced into the ring as the arbor and plate are brought toward each other relatively, means to cool the ring when stretched over the arbor, a stripper-plate above the support and having an aperture to receive the arbor as the arbor and support are moved toward each other, the said stripper-plate operating to strip the ring from the arbor, as the latter and the support are moved away from each other.

709,518. PROCESS OF FRAMING GLASS OR OTHER MATERIALS. HENRY W. SCATTERGOOD, Philadelphia, Pa. Filed June 18, 1902. Serial No. 112,381. (No specimens.)



Claim.—1. The process of framing glass and other material, consisting in arranging the constituent pieces upon a removable base, with spaces between their contiguous edges and around the perimeter, filling said spaces with a substance capable of being dissolved or washed out, metallizing the filling in the spaces, applying a backing to the thus-metallized object, removing the base and filling, and then exposing the object to the action of an electrodepositing apparatus and thereby supplying the spaces with electrodeposited metal.

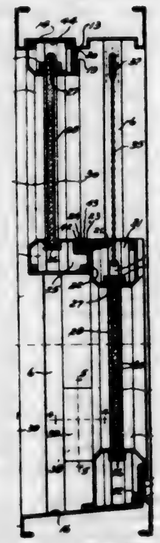
2. The process of framing glass and other material, consisting in arranging the constituent pieces upon a removable base, with spaces between their contiguous edges and around the perimeter, filling said spaces with a starch-like substance, covering the object with a removable supporting material, reversing the whole, detaching the base, metallizing the spaces, applying a backing to the thus-metallized object, removing the support and filling, and then exposing the object to the action of an electrodepositing apparatus whereby the spaces are supplied with electrodeposited metal.

3. The process of framing glass and other material, consisting in arranging the constituent pieces upon a removable base, with spaces between their contiguous edges and around the perimeter, filling said spaces with a fugitive soluble substance, covering the object with a removable supporting material, reversing the whole, detaching the base, metallizing the spaces, coating the thus-metallized object with an adhesive, applying a backing to the thus metallized and coated object, removing the support and filling, and then exposing the object to the action of an electrodepositing apparatus and thereby supplying the spaces with electrodeposited metal.

4. The process of framing glass and other material, consisting essentially in sticking the constituent elements of the object upon a fugitive base, such as tissue-paper, with intervening spaces between the said constituent elements, surrounding the object with a non-conducting border, with an intervening space, inclosing the thus-bordered object in a curb, filling the spaces with a fugitive substance, capable of being washed or dissolved out covering the object to the height of the curb with sand or other removable packing, reversing the object, removing the base and substituting thereafter metallization, sticking on such metallization, then applying a backing of plastic material, then removing the backing and the filling and cleaning the object, and finally exposing the object upon its backing to the action of an electrodepositing or an electroplating apparatus and depositing in the spaces the metal of the bath, and then removing the object, detaching the backing and cleaning said object.

5. The process of framing glass and other material, consisting essentially in sticking the constituent elements of the object upon a fugitive base, such as tissue-paper, with intervening spaces between the said constituent elements, surrounding the object with a non-conducting border, with an intervening space, inclosing the thus-bordered object in a curb, filling the spaces with a substance capable of being dissolved or washed out, covering the object to the height of the curb with a removable packing, reversing the object, removing the base and substituting thereafter metallization, sticking on such metallization, then applying a backing of plastic material, then removing the backing and the filling and cleaning the object, and finally exposing the object upon its backing to the action of an electrodepositing or an electroplating apparatus and depositing in the spaces a film of metal, then removing the object and introducing into the spaces a filling of metal powder, filings or other substance, then replacing in the bath and electrodepositing a finishing-film upon the filling, and finally removing the object from the bath and its backing, and cleaning it.

709,514. SHEET-METAL WINDOW FRAME AND SASH. CHAS B. SCHILLING, Chicago, Ill. Filed Mar. 24, 1902. Serial No. 99,743. (No model.)



Claim.—1. The combination of a window-frame; a sheet-metal sash fitting within said frame and having on one face a flange lying in a plane substantially parallel with said face and adapted to hold a weather-strip in suitable position to engage said frame along the edge of said sash.

2. The combination of a window-frame; a weather-strip comprising a strip of packing secured on a suitable bar of sheet metal; and a sash mounted in said frame and having a side bar formed of sheet metal, said metal being bent upon itself along one face to form a flange adapted to secure said weather-strip against said face and in contact with said frame, substantially as shown and described.

3. The combination of a window-frame with stops thereon for a sliding sash; a sash having a side bar formed of sheet metal bent to form a groove for receiving the window-pane and having flanges on the face of said bar toward the frame; and a sheet-metal tongue having opposite flanges for slidably engaging the flanges on said sash; all arranged to

permit the lengthwise withdrawal and insertion of the tongue, and to permit the sash to be swung laterally free from the stops and removed from the frame when said tongue is withdrawn; said tongue being adapted to slidingly engage the stops to prevent sash removal of the sash when the tongue is inserted between the sash and frame; said side bar being formed of a single piece of sheet metal doubled upon itself on the inner face to form a flange adapted to engage a weather-strip substantially as shown.

4. A window-sash having a side bar formed of a piece of sheet metal bent to form a groove for receiving the window-pane, and being doubled upon itself upon the inner face to form a flange adapted to engage a weather-strip substantially as shown.

5. A window-sash having a cross-bar formed of sheet metal bent to form a channel for receiving the window-pane, said channel having a removable inner part to permit said pane to be passed entirely through said cross-bar, said cross-bar having its front and back extended beyond said inner part and bent to engage the edges of a sheet-metal cover, and a removable sheet-metal cover having its edges bent to interlock with the front and back of said cross-bar.

6. A window-sash having a cross-bar formed of sheet metal bent to form a channel for receiving the window-pane, said bar having its front and rear walls bent to engage a sheet-metal cover, and a removable sheet-metal cover having its edges bent to engage said front and rear walls and being doubled upon itself to form a flange and channel adapted to engage a weather-strip substantially as shown.

7. The combination of a window-frame, a sash slidably mounted in said frame, said sash being of sheet metal and being suitably bent to form a groove extending around three sides of same and lying in a plane substantially parallel with that of the sash, and a weather-strip removably seated in said groove and fitting against the adjacent surfaces of said frame.

8. The combination of a window-frame having ways or grooves therein for guiding a sliding sash, a sash slidably mounted in said frame and having a side bar arranged to slidingly engage a tongue seated in one of said grooves, and a tongue adapted to be inserted lengthwise between the side bar and frame in said groove and being formed of two sections suitably connected to permit the upper section to be tilted on the lower section for insertion in the groove, substantially as shown.

9. The combination of a window-frame having ways or grooves therein for guiding a sliding sash, a sash slidably mounted in said frame and having a side bar arranged to slidingly engage a tongue seated in one of said grooves, and a channel-shaped sheet-metal tongue adapted to be inserted lengthwise between the side bar and frame in said groove and being notched in its side walls to permit said tongue to bend at the notched part substantially as and for the purpose described.

10. A window-sash having a cross-bar formed of sheet metal bent to form a channel for receiving the window-pane, said channel having a removable inner part to permit said pane to be passed entirely through said cross-bar, said cross-bar having its front and back extended beyond said inner part and bent to engage the edges of a sheet-metal cover, and a removable sheet-metal cover having its edges bent to interlock with the front and back of said cross-bar, and being adapted to be withdrawn lengthwise from one end of said cross-bar, substantially as shown.

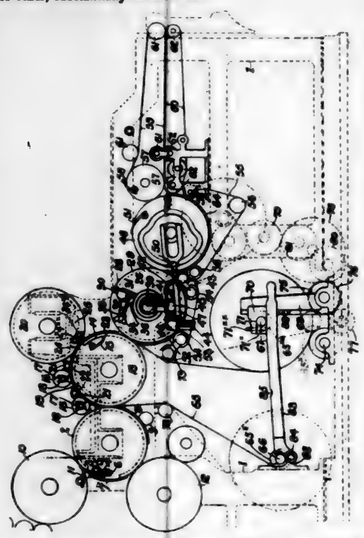
709,515. PRINTING-MACHINE. WALTER SCOTT, Plainfield, N. J. Filed Oct. 7, 1899. Serial No. 732,881. (No model.)

Claim.—1. In a rotary printing-press, an impression-cylinder having a longitudinal opening in the periphery thereof, grippers on said cylinder adapted to coact with the cylinder at one edge of said opening to retain sheets, and a removable section for placement in said opening to adapt the cylinder for web-printing, said grippers being held inside of said cylinder by said section.

2. In a rotary printing-press, an impression-cylinder provided with a longitudinal opening in the periphery thereof, grippers on said cylinder adapted to coact with the cylinder along one edge of said opening, a removable section for placement in said opening to adapt the cylinder to web-printing, said grippers being held inside of said cylinder by said section, and a tympan-web adapted to pass over said cylinder.

3. In a printing-machine, the combination of an impression-cylinder, a form or plate cylinder coacting with said impression-cylinder, guides at each side of but not crossing the printing-line of said cylinders and coacting with said impression-cylinder to retain the sheets thereon, and movable fingers on the plate-cylinder for coacting with the impression-cylinder to retain the heads of the sheets thereagainst while passing from one set of guides to the other, substantially as described.

4. In a printing-machine, the combination of an impression-cylinder, a tympan-web passing over said cylinder, a form or plate cylinder coacting with said impression-cylinder and web, guides at each side of but not crossing the printing-line of said cylinders and coacting with said impression-cylinder and web to retain the sheets thereon, and movable fingers on the plate-cylinder for coacting with the impression-cylinder to retain the heads of the sheets thereagainst while passing from one set of guides to the other, substantially as described.



5. In a printing-machine, the combination of two rotary printing-couples, a tympan-web passing over the impression-cylinder of the second couple, means for retaining the sheets on the first impression-cylinder and transferring them to the second impression-cylinder, lifting-fingers on the second form or plate cylinder for coaction with the second impression-cylinder to hold the heads of the sheets against said second impression-cylinder as the said heads pass the plate-cylinder, and guides coacting with said second impression-cylinder at each side of but not crossing the printing-line thereof, substantially as described.

6. In a printing-machine, the combination of first and second impression-cylinders, first and second form or plate cylinders, a tympan-web, grippers and lifting-fingers on the first impression-cylinder for retaining the sheets thereon and for delivering them to the second impression-cylinder, guides coacting with said second impression-cylinder to take and retain said sheets, said guides not crossing the printing-line of said second impression-cylinder, other guides at the other side of but not crossing the printing-line of said second impression-cylinder, and outwardly-movable pressers on the second form or plate cylinder for coaction with the second impression-cylinder to hold the sheets thereagainst while passing said printing-line from one set of guides to the other, substantially as described.

7. In a printing-machine, the combination of first and second impression-cylinders, form or plate cylinders coacting therewith, a tympan-web on the second impression-cylinder, means for retaining sheets upon the first impression-cylinder and moving their heads away therefrom, guides coacting with said second impression-cylinder and with said delivery or retaining means of the first impression-cylinder to transfer the sheets to the second impression-cylinder, means carried by the second plate-cylinder for retaining the heads of the sheets against the second impression-cylinder as they pass the printing-line thereof, a take-off cylinder, and an exhaust on said take-off cylinder for drawing the heads of the sheets from said tympan-web, substantially as described.

8. In a printing-machine, the combination of an impression-cylinder, a tympan-web thereon, a take-off cylinder, and exhausts on said take-off cylinder for drawing the heads of sheets away from said tympan-web, substantially as described.

9. In a printing-machine, the combination of an impression-cylinder, a tympan-web thereon, a take-off cylinder provided with exhaust-nozzles for drawing the heads of sheets from said tympan-web, a transfer or collecting cylinder, and a delivery, substantially as described.

10. In a printing-machine, the combination of a blanket-cylinder, an air or exhaust pipe journaled on said cylinder adjacent one edge of said blanket-supporting surface of said cylinder and provided with nozzles, and means for rotating said pipe to press said nozzles against said edge and sheet or blanket to retain the same in place, substantially as described.

11. In a printing-machine, the combination of two rotary printing-couples for perfecting sheets, a tympan-web, means for retaining the sheets on the impression-cylinders of said couples and transferring from the first to the second thereof, a take-off cylinder 26, and an air-pipe 27 thereon having outlets 30, substantially as described.

12. In a printing-machine, the combination of impression-cylinder 2 provided with grippers 3 and lifting-fingers 4, pressure and feeding roll 9 coacting with cylinder 2 at a point intermediate the printing-line thereof and the point of transfer of the sheets to the second impression-cylinder, a plate or form cylinder coacting with cylinder 2, a second impression-cylinder, guides 19 coacting with said second impression-cylinder, and a plate or form cylinder coacting with said second impression-cylinder, substantially as described.

13. In a printing-machine, the combination of impression-cylinder 2 provided with grippers 3 and lifting-fingers 4, a coacting form or plate cylinder 12 below and to one side of cylinder 2, pressure-roll 9 coacting with cylinder 2 at a point intermediate the printing-line thereof and the point of transfer to the second impression-cylinder, a second impression-cylinder 13, guides 19 and 23 and pressure-rolls 16 coacting with cylinder 13, said guides 19 and 23 not crossing the printing-line of cylinder 13, a tympan-web on cylinder 13, a plate or form cylinder 20 coacting with cylinder 13 and provided with lifting-fingers 24, and means for taking the sheets from cylinder 12, substantially as described.

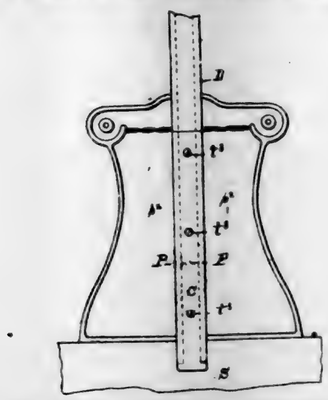
14. In a printing-machine, the combination of a rotary printing-couple for giving impressions on one side of sheets, a second impression-cylinder 13, guides 19 and pressure-rolls 16 coacting with said cylinder 13, said guides not crossing the printing-line of the cylinder 13, means carried by the impression-cylinder of said rotary couple for transferring sheets therefrom to said cylinder 13 and guides 19, a tympan-web on cylinder 13, a plate or form cylinder 20 coacting with cylinder 13, and lifting-fingers 24 on said cylinder 20, substantially as described.

15. In a printing-machine, the combination of an impression-cylinder (as cylinder 13), guides (as guides 19), and pressure-rolls (as rolls or pulleys 16) whose surface speed is greater than that of the said impression-cylinder, substantially as described.

16. In a printing-machine, the combination of an impression-cylinder, a take-off cylinder, air-ports in said take-off cylinder, means for drawing air into and for blowing it out of said ports, whereby sheets may be drawn against said take-off cylinder and may be blown therefrom, and means for receiving the sheets blown from the take-off cylinder.

17. In a printing-machine, the combination of an impression-cylinder, a tympan-web thereon, a take-off cylinder, air-ports in said take-off cylinder, means for drawing air into and blowing it out of said ports, whereby sheets may be drawn against said take-off cylinder and be blown therefrom, and means for receiving the sheets blown from the take-off cylinder.

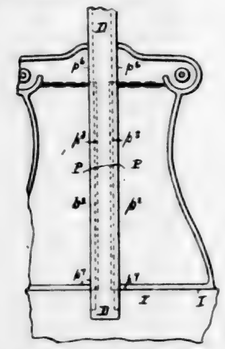
709,516. END PANEL AND SEAT-POST FOR OPEN CARS. JOHN SEEBERGER, Watervliet, N. Y., assignor to John H. Jones, Watervliet, N. Y. Filed Apr. 24, 1902. Serial No. 104,443. (No model.)



Claim.—1. The combination with a seat-post of an open car having a recessed or vertically cut-away portion on its outer face; of a seat-panel made of metal in two vertically-divided parts adapted to be placed with their inner vertical edges together within said recessed part and thereat secured to the seat-post; and a clamping-bar shaped to be inserted within said recessed or cut-away part of the post and be thereat secured outside of the inner edges of the panel parts, substantially as and for the purposes set forth.

2. The combination with a metal car-seat end panel made in two vertically-divided panel parts, each having ears for attachment to the car-floor; of a car-seat post having certain-groove part formed therein, and a vertically-recessed portion on its outer face below said certain-groove part; wherein said panel parts may be placed with the vertical edges in contact and thereat secured to the post; and a clamping-bar having formed therein a continuation of said certain-groove, said bar being adapted to be inserted within the recessed part of the post, and connected thereto exteriorly of said panel part and to extend downwardly and have the bottom of the certain-groove below the car-floor substantially as herein set forth.

709,517. END PANEL FOR OPEN-CAR SEATS AND THE SEAT-POST WITH WHICH IT CONNECTS. JOHN SEEBERGER, Watervliet, N. Y., assignor to John H. Jones, Watervliet, N. Y. Filed Apr. 24, 1902. Serial No. 104,444. (No model.)



Claim.—1. The combination with the seat-posts of an open car each having a groove vertically formed therein at each of its opposite sides, of a metal panel formed in two vertically-divided parts, each provided with a tonguing part on its inner vertical edge, and each adapted to have its tonguing edge part inserted in one of said grooves in the seat-post, and outside its entered tonguing part to be secured to the post substantially as and for the purposes set forth.

2. The combination with the seat-posts of an open car each made to extend downwardly below, and outside of the car-sill into which it is mortised, and provided with a certain-groove arranged in each side thereof to extend downwardly below the car-floor, and having another groove in each of its opposite sides; of a metal panel vertically divided in two panel parts each of which latter is constructed with a tonguing inner edge; and each of which is adapted to be inserted in one of the last-named grooves, and be thereat secured to the post substantially as, and for the purposes set forth.

709,518. MESSAGE-DELIVERING DEVICE FOR TRAINS. PETER P. SHIVE, Dickeys Mountain, Pa., assignor of one-half to John V. Fisher, Baltimore, Md. Filed Feb. 13, 1902. Serial No. 93,962. (No model.)

Claim.—1. A movable shelf having a longitudinal passage for messages in combination with supports connecting it to the body of a car and holding it parallel thereto, and means for automatically moving it outward from said body or retracting it within the same at will substantially as set forth.

2. A shelf having a receiving-passage in one end for message-bearing cylinders, in combination with a hinged tube, in rearward continuation thereof, extending within the car, and mechanism for automatically moving said shelf out and in substantially as set forth.

3. A shelf having a receiving-passage for message-bearing cylinders, and a tube, movable with it, in continuation of the said passage, in combination with a receptacle carried on the end of the said tube within the car and automatic mechanism for moving the said shelf-tube and receptacle outward and inward together substantially as set forth.

4. A device carried by a car and adapted to receive a message-holding receptacle and deliver the same within the car, in combination with mechanism for automatically moving the said device inward and outward, a box moving with the said device and receiving what it discharges and means for attaching the latter to the car, but allowing its inward and outward movement substantially as set forth.

5. In combination with a receiving device for messages and means for automatically moving it inward and outward with respect to the body of a car, a box moving with the said device, receiving the discharge therefrom and provided with an interior deflecting-plate and cushion, substantially as set forth.

6. In combination with a guide-rail fixed along the track, a crank-shaft carried by a car and a message-receiving device and connections, adapted to be thrown out into operative position by the contact of the said shaft with the said guide-rail substantially as set forth.

7. In combination with a fixed device, a message receiving or delivering device carried by a car, supports connecting it to the body of a car and holding it parallel thereto and means connected with the latter and arranged for contact with the former in order that such contact may move outward said device thus carried substantially as set forth.

8. A telescopic crank-shaft, provided with means for adjusting it at will out of contact, in combination with a guide-rail arranged for contact with an attachment of the said shaft and means for receiving or delivering messages operated by the contact of said rail and shaft the said means and shaft being carried by a car substantially as set forth.

9. A guide-rail fixed beside the track and having one of its curved ends hinged to bend inwardly but not outwardly and provided with a spring for holding it in position, in combination with message receiving and delivering mechanism carried by a car and moved into operative position by contact of a part of the same with the said guide-rail, substantially as set forth.

10. A shelf adapted to present a message-holding cylinder for delivery and carried by a car, in combination with means for automatically moving said shelf out into operative position by contact with the said rail and a spring for replacing the same within the side of the car substantially as set forth.

11. A shelf carried by a car and provided with means for receiving and delivering message-holding cylinders, in combination with a hinged arm, connecting the said shelf to the side of the car, a crank-shaft, a second arm connecting the said shelf to the said shaft, a spring for retracting the said shelf flush with the side of the car, a fixed guide rail adapted to turn said crank-shaft, for throwing out the said shelf into operative position substantially as set forth.

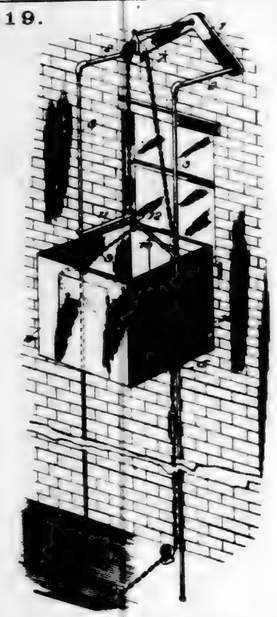
12. A movable shelf carried by a car and adapted to receive and deliver message-holding cylinders, in combination with a pair of hinged arms, folding with said shelf into the side of the car, a receiving-tube extending from said shelf through the latter a crank-shaft and spring acting reversely on one of said arms and a guide-rail arranged for contact with said crank-shaft as set forth.

13. A movable shelf carried by a car and adapted to receive and deliver message-holding cylinders, in combination with a pair of hinged arms, folding with said shelf into the side of the car and adjustable as to length, a receiving-tube extending from said shelf into the car and a receptacle arranged to receive the cylinders from the said tube substantially as set forth.

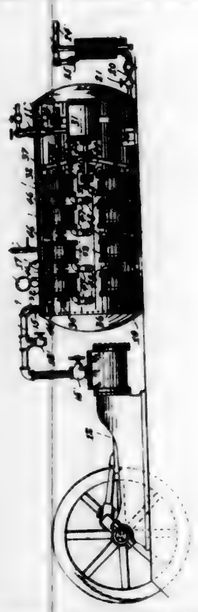
709,519. FIRE-ESCAPE. JAMES W. GRIFFIN, Menlo, Ga. Filed July 2, 1902. Serial No. 114,224. (No model.)

Claim.—The herein-described safety appliance or fire-escape comprising suitable supporting-rails 3 operatively mounted in position upon the side of a building, in combination with a car or cage; means to operatively connect the car with said guiding-rails; a bail connected to the upper end of said car; a cable attached to said bail and passing around a pulley; a pair of gripping-arms operatively connected to said cable and said car and a brake carried by said car and adapted to be manually controlled whereby a gripping action may be set up between said brake and guiding-rails all operatively combined substantially as specified and for the purpose set forth.

709,519.



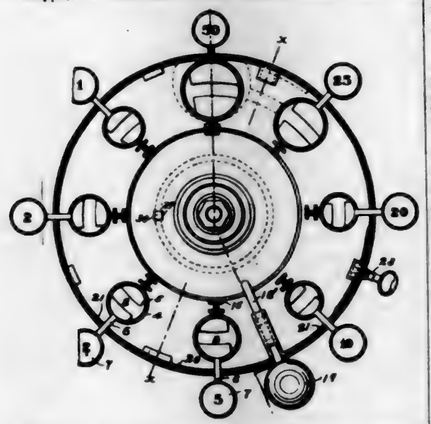
709,520. AIR-COMPRESSING APPARATUS. EDWARD J. ST. CROIX, Madrona, Wash. Filed Dec. 23, 1901. Serial No. 86,973. (No model.)



Claim.—In an apparatus for compressing and storing air; a reservoir, a main conduit adapted to convey air under pressure to said reservoir, a gate-valve to control said conduit and a second gate-valve in the conduit closely adjacent said reservoir, an auxiliary conduit adapted to convey steam to the main conduit and a gate-valve to control same, a driving-cylinder, a branch conduit leading from the main conduit to said

cylinder and having a gate-valve therein, a double series of air-compressing cylinders each of less length of bore than said driving-cylinder, said series arranged within the cylinders in tandem and disposed at opposite sides of the center line of the driving-cylinder, a conduit leading from one head of each compression-cylinder to the reservoir and a port of ingress in said end, a check-valve in last said conduit, and a check-valve arranged to control said port, a piston-rod for each series of cylinders and a like rod for the driving-cylinder, oppositely-disposed levers operably connected to the rod of the driving-cylinder and arranged to drive the piston-rods of the compression-cylinders, valve-operating mechanism for the valve of the driving-cylinder operably connected to one of said levers, and a manually-operative air-pump connected to said reservoir.

709,521. CHANGE-MAKING MACHINE. PASCAL H. SPERMAN, Newport, R. I. Filed Sept. 13, 1901. Serial No. 75,259. (No model.)



Claim.—1. A carrier provided with coin-tubes arranged to slide longitudinally in said carrier.

2. A carrier provided with coin-tubes arranged to slide longitudinally in said carrier, each of said tubes having a discharge-opening.

3. The combination of a carrier provided with a coin-tube arranged to slide therein and means for ejecting a coin from said tube, one of said parts, viz., the carrier and ejecting means, having a movement with relation to the other part to eject a coin from said tube.

4. The combination of a carrier provided with coin-tubes and means for ejecting coins from said tubes, one of said parts, viz., the carrier and ejecting means, having a rotary movement with relation to the other part to eject coins from said tubes, said coin-tubes being movable into and out of the path of said ejecting means.

5. The combination of a carrier provided with coin-tubes and means for ejecting coins from said tubes, one of said parts having a rotary movement with relation to the other part to eject coins from said tubes, said coin-tubes being independently movable into and out of the path of said ejecting means.

6. The combination of a carrier provided with coin-tubes and means for ejecting coins from said tubes, one of said parts having a rotary movement with relation to the other part to eject coins from said tubes, said coin-tubes being movable into the path of said ejecting means, and means for automatically moving said tubes out of the path of said ejecting means.

7. The combination of a carrier provided with coin-tubes and means for ejecting coins from said tubes, one of said parts having a rotary movement with relation to the other part to eject coins from said tubes, said coin-tubes being independently movable into the path of said ejecting means, and means for automatically moving out of said path all of the tubes that may have been moved into said path.

8. The combination of a carrier provided with coin-tubes and means for ejecting coins from said tubes, one of said parts having a rotary movement with relation to the other part to eject coins from said tubes, said coin-tubes being movable into and out of the path of said ejecting means, and means for locking said tubes out of said path.

9. The combination of a rotary carrier having a series of guide-tubes and a series of coin-tubes arranged to slide in said guide-tubes and means for automatically ejecting coins from said coin-tubes by revolving the carrier.

10. The combination of a rotary carrier, a series of guide-tubes, a series of coin-tubes arranged to slide in said guide-tubes, means for depressing said coin-tubes and means for automatically ejecting the coins from said coin-tubes when the carrier is revolved.

11. The combination of a rotary carrier having a series of guide-tubes, a series of coin-tubes arranged to slide in said guide-tubes and provided with laterally-projecting arms for depressing said tubes and means for automatically ejecting the coins from the coin-tubes when the carrier is revolved.

12. The combination, with a standard, of a rotary carrier having a series of guide-tubes, a series of coin-tubes arranged to slide in said guide-tubes, each coin-tube being provided with a laterally-projecting arm and a discharge-opening, and means for automatically ejecting a coin through said opening when the carrier is revolved.

13. The combination, with a standard, of a rotary carrier having a series of guide-tubes, a series of coin-tubes, arranged to slide in said guide-tubes, each coin-tube being provided with a laterally-projecting arm, a transverse slot in the bottom and a discharge-opening in the side of said tube, and means arranged to enter said slot for automatically ejecting a coin through said discharge-opening when the carrier is revolved.

14. The combination, with a standard, of a rotary carrier, a series of coin-tubes arranged to slide in said carrier, each coin-tube having a slot in one end and a discharge-opening in the side thereof, and a lug or projection arranged to enter said slot and eject a coin through said discharge-opening when the carrier is revolved.

15. The combination, with a standard, of a rotary carrier having a series of guide-tubes, a series of tubes arranged to slide therein, each coin-tube being provided with a curved slot in one end and a discharge-opening in the side thereof of a size to allow the passage of one of the coins in said tube, means arranged to enter said slot and engaging the lowermost coin in the coin-tube and eject it through said discharge-opening, and means for revolving the carrier.

16. The combination, with a standard provided with a cam, of a rotary carrier having a series of coin-tubes mounted to slide therein, each coin-tube being provided with a laterally-extending arm for moving it in one direction, means actuated by said cam for moving the coin-tubes in the other direction, and means for rotating the carrier.

17. The combination, with a standard provided with a stationary cam, of a rotary carrier having a series of coin-tubes mounted to slide therein, each coin-tube being provided with a laterally-extending arm, a series of slides having their upper ends arranged to engage said laterally-extending arms and their lower ends arranged to engage said stationary cam as the carrier is revolved and automatically raise the coin-tubes.

18. The combination, with a standard provided with a stationary cam, of a rotary carrier having a series of coin-tubes provided with laterally-extending arms for depressing said tubes, a series of slides mounted in the carrier having their upper ends engaging said laterally-extending arms and their lower ends arranged to engage the stationary cam on the standard when the coin-tubes are depressed and the carrier revolved.

19. The combination of a carrier provided with guide-tubes, coin-tubes arranged to slide in said guide-tubes and friction devices acting on said coin-tubes.

20. The combination, of a carrier provided with coin-tubes arranged to slide longitudinally in said carrier, and means for locking said coin-tubes against sliding movement in one direction.

21. The combination of a carrier provided with coin-tubes arranged to slide longitudinally in said carrier, a cover for said carrier, means for locking said cover in place and means for locking said coin-tubes against sliding movement in one direction.

22. The combination of a carrier provided with coin-tubes arranged to slide longitudinally in said carrier, a cover for said carrier, and means for locking said cover in place and also locking said coin-tubes against sliding movement in one direction.

23. The combination of a carrier provided with coin-tubes arranged to slide longitudinally in said carrier, a cover for said carrier, and means operating to lock said cover in place by one movement and by a further movement to lock said coin-tubes against movement in one direction.

24. The combination, with a rotary carrier, of a series of coin-tubes mounted to slide therein and provided with laterally-extending arms, a rotary ring mounted on the carrier and provided on its edge with a series of slots arranged to normally underlie the laterally-extending arms, and means for rotating said ring to bring the edge thereof under said arms and thereby lock said coin-tubes against sliding movement.

25. The combination of a rotary carrier, a cover therefor, a series of coin-tubes arranged to slide in said carrier, a rotary ring mounted on said carrier and provided with means for locking the coin-tubes against movement in one direction.

26. The combination of a rotary carrier, a cover therefor, a series of coin-tubes arranged to slide in said carrier, and provided with laterally-extending arms, a rotary ring mounted on said carrier and provided with a series of slots arranged to normally underlie said laterally-extending

arms and with means for engaging the cover to lock the same on the carrier.

27. The combination of a rotary carrier, a cover therefor, a series of coin-tubes arranged to slide in said carrier and provided with laterally-extending arms, a rotary ring mounted on said carrier and provided with a series of slots arranged to normally underlie said laterally-extending arms and with means for engaging the cover to lock the same on the carrier, and means for giving to said ring two movements, one movement to lock the cover and another movement to lock the coin-tubes against sliding movement in one direction.

28. The combination, with a standard, of a rotary carrier provided with a handle for rotating said carrier and means connected with said handle for locking the carrier against revolution.

29. The combination, with a standard provided with an opening, of a rotary carrier provided with a lever, a handle attached to one end of said lever and a bar attached to the other end of said lever, the free end of said bar being arranged to engage the opening in said standard when the bar is depressed.

30. The combination, with a standard provided with an opening and a series of notches, of a rotary carrier provided with a locking-bar for engaging said opening, and a detent for engaging said notches.

31. The combination of a carrier provided with coin-tubes, means for ejecting coins from said tubes, one of said parts having a movement with relation to the other part to eject coins from said tubes, said coin-tubes being movable into and out of the path of said ejecting means, and means for locking said tubes out of said path.

709,522. SHEARING TOOL OR CLIPPER. JOHN K. STEWART, Chicago, Ill. Filed Apr. 14, 1902. Serial No. 102,736. (No model.)

Claim.—1. A shearing-tool, comprising a fixed cutter and a vibrating cutter, a lever by which the latter is held in contact with the former, said lever having an upstanding knob or boss, a saddle having a downwardly-concave seat by which it is lodged upon the top of the knob, said saddle having a flat extended upper face, means for vibrating the cutter, and a tension-screw set through the top of the case having a flat lower end bearing upon the flat upper face of the saddle.

2. A shearing-tool, comprising a fixed cutter and a vibrating cutter, a lever by which the latter is held in contact with the former, said lever having an upstanding knob or boss, a saddle having a downwardly-concave seat by which it is lodged on the knob, said saddle having an extended flat upper face provided with a central concavity, means for vibrating the cutter, and a tension-screw set through the top of the case, terminating at the lower end in a flat face which bears upon the upper flat face of the saddle beyond the margin of the concavity in the latter, said tension-screw having an oil-cavity, and an oil-port leading from such cavity opening through its lower terminal flat face above the concavity of the saddle.

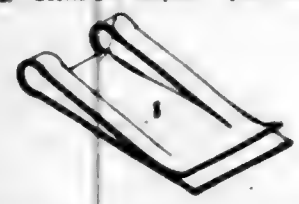
3. A shearing-tool, comprising a fixed cutter and a vibrating cutter, a tension-lever by which the latter is held in contact with the former, a lever for actuating the vibrating cutter and the tension-lever, said cutter-actuating lever being apertured and the tension-lever being exposed from above through such aperture, an upstanding knob or boss on the tension-lever, a saddle extending into such aperture and having a downwardly-concave seat by which it is lodged on the knob or boss, said saddle having a broadly-extended flat upper face, and a tension-screw set through the case, having a flat face at the lower end, bearing upon the flat upper face of the saddle.

4. A shearing-tool, comprising a fixed cutter and a vibrating cutter, and a lever for actuating the latter, having at its end remote from its engagement with the cutter a downwardly-projecting spindle, a ball having a vertical aperture to afford bearings for the spindle, a spherical seat in which such ball is retained, a longitudinal shaft and a crank-stud thereon engaging the lever forward of its fulcrum in the ball to vibrate it about the axis of the spindle, and means mounted on the case forward of the crank engagement with the lever for causing the lever to press upon the vibrating cutter.

5. A shearing-tool, comprising a fixed cutter and a vibrating cutter, a lever for actuating the latter, a ball to which said lever is pivoted for such vibration at its end remote from its engagement with the vibrating cutter, a spherical seat in which such ball is retained, a longitudinal shaft, and a crank-stud thereon engaging the lever forward of its pivot in the ball to vibrate it about said pivot, and means mounted on the case forward of the crank engagement of the shaft with the lever for causing the lever to press upon the vibrating cutter.

6. A shearing-tool, comprising a fixed cutter and a vibrating cutter, a lever for actuating the latter, a longitudinal shaft and a crank-stud thereon engaging the lever to vibrate it, a ball to which the lever is pivoted for such vibration, having a spherical seat above the bearing of the longitudinal shaft rearward from the crank engagement of said shaft with the lever, and means mounted on the case forward of said crank engagement for causing the lever to press upon the vibrating cutter.

709,528. PAPER-CLIP. SAMUEL R. STRATTAN, Washington, D. C. Filed Apr. 19, 1902. Serial No. 103,675. (No model.)



Claim.—1. A blank for paper-clips comprising a strip of resilient material having longitudinally-extending parallel slits intermediate its ends, the material between the slits being divided laterally at right angles to the slits to provide two tongues extending inwardly from the opposite ends of the strip.

2. A blank for paper-clips comprising a strip of resilient material having longitudinally-extending parallel slits intermediate its ends, the material between the slits being divided laterally at right angles to the slits to provide two tongues extending inwardly from the opposite ends of the strip, said tongues being of unequal length.

3. A blank for paper-clips comprising a strip of resilient material having longitudinally-extending parallel slits intermediate its ends, a portion of the material between the slits being cut away to provide two tongues extending inwardly from the opposite ends of the strip, said tongues being of unequal length, the cut edges of the tongues extending at right angles to said slits.

4. A paper-clip comprising a strip of resilient material folded to U shape and having a recess extending forwardly from the fold thereof; and an integral tongue formed on each end of said strip and extending rearwardly into said recess.

5. A paper-clip comprising a strip of resilient material folded to U shape and having a recess extending forwardly from the fold thereof; and opposing tongues extending rearwardly from the mouth of the clip into said recess.

6. A paper-clip comprising a strip of resilient material folded to U shape and having an open recess extending forwardly from the fold thereof; and opposing tongues extending rearwardly from the mouth of the clip into said recess, the upper tongue having its free end turned up to permit its being raised from the paper.

7. A paper-clip comprising a strip of resilient material folded to U shape, and having laterally-extending opposing surfaces adapted to bear on the paper at spaced points longitudinally of the clip, said surfaces being of unequal width, an open recess being formed in rear of said surfaces extending from the fold of the clip.

8. A paper-clip comprising a strip of resilient material folded to U shape, and having independent laterally-extending opposing surfaces adapted to bear on the paper at spaced points longitudinally of the clip, the rear surface being of less width than the forward surface, an open recess being formed in rear of said surfaces extending from the fold of the clip.

9. A paper-clip comprising a strip of resilient material folded to U shape, the mouth thereof forming laterally-extending opposing surfaces, and independent opposing surfaces located in rear of said mouth, said rear surfaces being of less width than the mouth, an open recess being formed in rear of said surfaces extending from the fold of the clip.

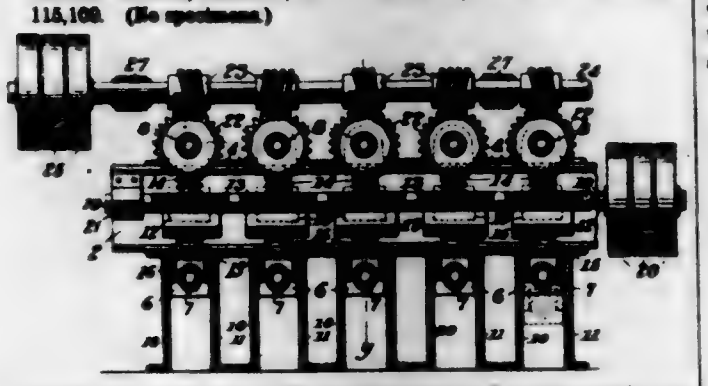
10. A paper-clip comprising a strip of resilient material folded to U shape, the mouth thereof forming laterally-extending opposing surfaces, and independent opposing surfaces parallel with and located in rear of the center of said mouth, said rear surfaces being of less width than said mouth, an open recess being formed in rear of said surfaces extending from the fold of the clip.

11. A paper-clip comprising a strip of resilient material folded to U shape, the mouth thereof forming laterally-extending opposing surfaces, and an independent tongue extending rearwardly from each of the ends of said strip, said tongues being of less width than the strip, whereby independent opposing surfaces will be provided in rear of said mouth, an open recess being formed in rear of said surfaces extending from the fold of the clip.

12. A paper-clip comprising a strip of resilient material folded to U shape, and having a recess extending forwardly from the fold thereof, and tongues extending rearwardly from the ends of the strip into said recess, said tongues being of unequal length.

13. A paper-clip comprising a strip of resilient material folded to U shape, and having a recess extending forwardly from the fold thereof, and an independent tongue formed integral with and extending rearwardly from each end of said strip, said tongues being of unequal length and opposing each other to form, with the mouth, inturned-extending opposing surfaces adapted to bear on the paper at spaced points longitudinally of the clip.

709,524. PROCESS OF INTENSIFYING THE LUSTER OF SILK. CHARLES STUART, Paterson, N. J. Filed July 10, 1902. Serial No. 115,169. (No specimens.)



Claim.—1. The process of intensifying the luster of silk, which consists in taking the skeins directly from the hydro-extractor after dyeing, and, while still damp, stretching them and simultaneously maintaining them in a stretched condition, causing them to be gradually revolved and subjecting them while so stretched and being revolved in a closed chamber to dry air at a temperature of about 120° Fahrenheit, thereby preventing shrinking during the drying, as set forth.

2. The process of intensifying the luster of silk, which consists in taking the skeins, after dyeing, from the hydro-extractor, and, while they are still damp, stretching them and simultaneously maintaining them in a stretched condition, causing them to be gradually revolved and calendered, and subjecting them while so stretched and being revolved and calendered, in a closed chamber, to dry air at a temperature of about 120° Fahrenheit thereby preventing shrinking during the drying, as set forth.

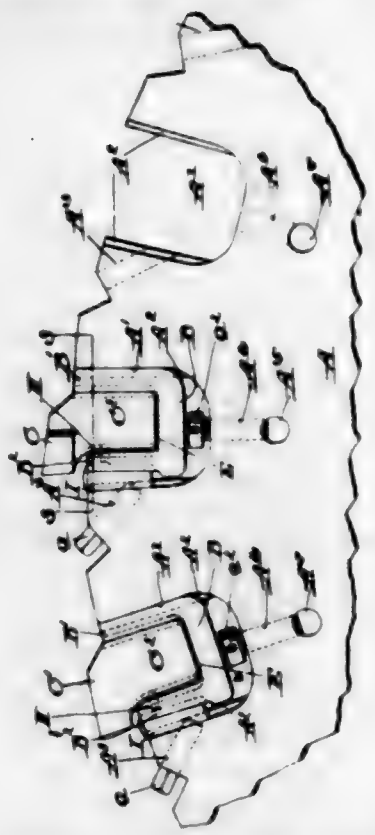
709,525. STOVEPIPE-VENTILATOR. FRANK E. TAFT, Jamestown, N. Y. Filed July 3, 1902. Serial No. 114,318. (No model.)

Claim.—1. The combination with a stovepipe and an exterior ventilating-drum, of an open-top receiver interposed between the drum and pipe and adapted to collect particles of soot and foreign matter carried into the drum.

2. The combination with a stovepipe or like flue, and a ventilating-drum surrounding the same, of a funnel-shaped receiver within the drum and surrounding the pipe or flue, and having its larger end presented upwardly and adapted to receive soot and particles of foreign matter which may enter the drum.

3. The combination with a stovepipe having openings, a drum of conical form surrounding the pipe and inclosing said openings, and damper-controlled inlets to said drum, of a funnel-shaped piece within the base of the drum and surrounding said pipe, and having its upper end open to receive particles of foreign matter which may be carried into the drum and prevent said particles being carried into the room.

709,526. METAL-CUTTING-TOOL HOLDER. FREDERICK W. TAYLOR, South Bethlehem, and SIDNEY NEWHOLD, Bethlehem, Pa. Filed Nov. 24, 1900. Serial No. 37,583. (No model.)



Claim.—1. A tool-holder having a cavity to receive a portion of a metal-cutting tool in combination with a metal-cutting tool having a portion inserted in said cavity and abutted against the wall thereof which receives the main thrust in working, and a packing of metal more easily fused than the metals of the tool and holder said metal being, in a fused condition, run into the spaces left between the walls of the cavity and the inserted portion of the tool and allowed to cool and solidify in said spaces to hold the tool in position.

2. A tool-holder having a cavity to receive a portion of a metal-cutting tool in combination with a metal-cutting tool having a portion inserted in said cavity and abutted against the wall thereof which receives the main thrust in working, said holder-cavity and inserted tool portion having one or more grooves, as b^1 C^1, formed therein, and a packing of metal more easily fusible than the metals of the tool and holder said metal being, in a fused condition, run into the spaces left between the walls and grooves of the cavity and the inserted portion of the tool and allowed to cool and solidify in said spaces to hold the tool in position.

3. A tool-holder having a cavity to receive a portion of a metal-cutting tool and said cavity having its wall which receives the main thrust in working smooth-finished, in combination with a metal-cutting tool having a portion inserted in said cavity the bottom side of said portion being smooth-finished on one face and directly abutted against the smooth-finished wall of the holder-cavity and a packing of metal more easily fusible than the metal of the holder and tool said metal being, while fused, run into the spaces left between the tool and the walls of the cavity in the holder and allowed to cool therein.

4. A tool-holder having a cavity to receive a portion of a metal-cutting tool in combination with a metal-cutting tool having a portion inserted in said cavity and abutted against the wall thereof which receives the main thrust in working, and a packing of metal more easily fused than the metals of the tool and holder and having the property of expanding in becoming solid, said metal being, in a fused condition, run into the

spaces left between the walls of the cavity and the inserted portion of the tool and allowed to cool and solidify in said spaces to hold the tool in position.

5. A tool-holder having a cavity to receive a portion of a metal-cutting tool in combination with a metal-cutting tool having a portion inserted in said cavity and abutted against the wall thereof which receives the main thrust in working, said holder-cavity and tool portion having one or more grooves, as b^3 C^1, formed therein and a packing of metal more easily fused than the metals of the tool and holder and having the property of expanding in becoming solid, said metal being, in a fused condition, run into the spaces left between the walls and grooves of the cavity and the tool and allowed to cool and solidify in said spaces to hold the tool in position.

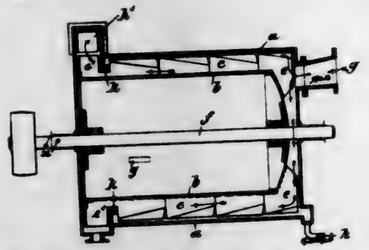
6. A tool-holder having a cavity to receive a portion of a metal-cutting tool and said cavity having its wall which receives the main thrust in working smooth-finished, in combination with a metal-cutting tool having a portion inserted in said cavity, the bottom side of said portion being smooth-finished and directly abutted against the smooth-finished wall of the holder-cavity and a packing of metal more easily fused than the metal of the holder and tool and having the property of expanding on becoming solid, said metal being, while fused, run into the spaces left between the tool and the walls of the cavity in the holder and allowed to cool therein.

7. A tool-holder having a cavity to receive a portion of a metal-cutting tool in combination with a metal-cutting tool having a portion inserted in said cavity and abutted against the wall thereof which receives the main thrust in working, a device for holding the tool in proper position in the holder independently of the metal packing, and a packing of metal more easily fused than the metals of the tool and holder, said metal being in a fused condition, run into the spaces left between the walls of the cavity and the tool and allowed to cool and solidify in said spaces to hold the tool in position.

8. A U-shaped tool-holder in combination with a metal-cutting tool having a portion set in the space between the arms of the holder and abutted against the arm in the direction of which the tool is thrust in working and a packing of metal more easily fused than the metals of the tool and holder which metal is run into the spaces between the tool and holder while fused and allowed to cool and solidify in said spaces.

9. A U-shaped tool-holder having grooves b^3 b^3 in its arms in combination with a metal-cutting tool having a grooved portion set in the space between the arms of the holder and abutted against the arm in the direction of which the tool is thrust in working and a packing of metal more easily fused than the metal of the holder and tool which metal is run into the spaces and grooves between the tool and holder while fused and allowed to cool and solidify in said spaces.

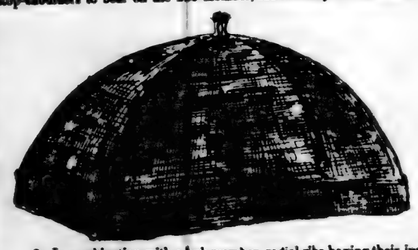
709,527. PROCESS OF TREATING GASES. EDWARD THEISEN, Baden, Germany. Filed Nov. 15, 1901. Serial No. 82,339. (No specimens.)



Claim.—The process of causing gases and liquids to flow in opposite directions in contact with each other, which consists in imparting a longitudinal motion to a body of gas, exposing said gas during its longitudinal travel to centrifugal action, and simultaneously applying to said gas a force tending to produce a motion in a contrary direction to that of the main longitudinal motion of said gas, interposing a liquid film in the path of the gas projected outwardly by centrifugal action and holding said liquid against outward movement under the influence of said gas, whereby the gas thrown outward with a tendency to travel in a direction opposite to its main flow, will cause the liquid to travel spirally in a direction opposite to the main flow of the gas.

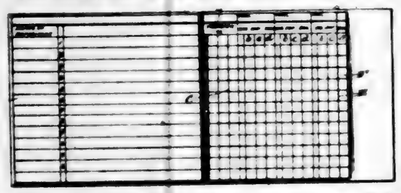
709,528. MOSQUITO-CANOPY. MARY E. WEBBER, Collierville, Tenn. Filed Dec. 13, 1901. Serial No. 86,566. (No model.)

Claim.—1. In combination with a hub member, radial ribs having their inner ends pivotally connected thereto, stirrup-levers pivotally connected to said hub member and adapted to swing outwardly and upwardly under the ribs, to extend the ribs radially and support them, and operating-levers pivotally connected to the hub member, having arms projecting outwardly therefrom to engage the under sides of said stirrup-levers, extend the same radially and support the same in said position, and having stop-shoulders to bear on the hub member, substantially as described.



2. In combination with a hub member, radial ribs having their inner ends pivotally connected thereto, stirrup-levers pivotally connected to said hub member and adapted to swing outward and upwardly under the ribs, to extend the ribs radially and support them, operating-levers pivotally connected to the hub member, having arms projecting outwardly therefrom to engage the under sides of said stirrup-levers, extend the same radially and support the same in said position, having eyes at their outer ends to overlap each other and one having a hook to engage the eye of the other and lock said levers with the stirrup-levers and ribs in extended position, and being further provided with stop-shoulders, to bear on the hub member, for the purpose set forth, substantially as described.

709,529. LEAF FOR BOOKS. CHARLES H. WHEATON, Iola, Kans. Filed Mar. 12, 1902. Serial No. 97,891. (No model.)



Claim.—A leaf for books having on one side an appropriately-designated balance-column at its right-hand outer edge, a vertical crease at the left thereof, said edge containing the balance-column designed to be turned to the right and folded on the line of said crease onto the opposite side of the leaf, substantially as described.

709,530. MANUFACTURE OF ENAMELED METAL PLATES. DANIEL WIRZER, Zurich, Switzerland, assignor to H. Salzbach & Co., Zurich, Switzerland, a Firm. Filed Apr. 14, 1902. Serial No. 103,943. (No specimens.)

Claim.—1. The method of enameling metal plates consisting in coating the plates with a mixture of zinc-white and oil-varnish, then drying them, coating the plates thus dried with greasy lacquer color and again drying them, then rubbing said plates with fine pumice-stone mixed with water, then printing them with permanent colors.

2. The method of manufacturing enameled metal plates consisting in coating fine and smooth rolled metal plates with a mixture of zinc-white and oil-varnish, then drying them, coating the plates thus dried with greasy lacquer color and again drying them, then grinding them dull by means of fine pumice-stone powder mixed with water, printing the dull-ground plates with permanent colors, drying the printed plates, then coating with greasy copal lacquer and finally drying them.

709,531. CORK-FASTENER. RICHARD BLECHNER, Cralfsheim, Germany. Filed Mar. 15, 1902. Serial No. 98,412. (No model.)

Claim.—The improved cork-fastener herein described and shown consisting of a single integral wire or rod having a U-shaped base portion adapted to fit around the neck of a bottle, horizontally-disposed spring-coils at the ends of the base portion, horizontal arms extending inward from the coils toward and engaging under the base portion and then extending outward from the same, vertical arms rising from the ends of said horizontal arms and having inwardly-curved portions at their upper ends, and holding points or pins extending horizontally inward from the ends of said curved portions.

709,532. WINDOW APPLIANCE. CHARLES E. BRADSHAW, Cleveland, Ohio. Filed Aug. 20, 1901. Serial No. 73,730. (No model.)

Claim.—1. In a window hinge and lock, the combination of a stud member having a button, separate hinge-pieces secured to the window-frame in which said member is pivoted, the pivotal portions and the button of the member being at the apices of a triangle and the hinge-pieces being spaced apart opposite the button, and a socket member carried by the window-sash in position to engage with the stud member when it is in one position to form a hinge.

2. In a window-hinge, a stud member having a button, a pair of hinge-pieces secured to the window-frame in which said member is pivoted, a socket member carried by the window-sash, said member comprising a plate with a flat portion and a projected portion having a U-shaped slot and side flanges extending into securing-spurs which enter the sash, against the side of which the plate is set and secured by screws through the flat portion, substantially as described.

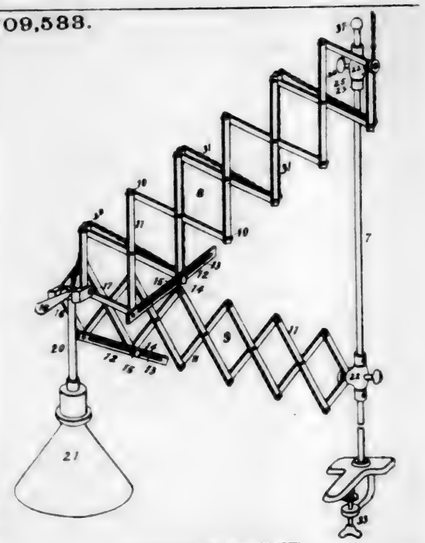
3. In a window-hinge, a stud member having a button, separate hinge-pieces secured to the window-frame in which said member is pivoted, the pivotal portions and the button of the member being at the apices of the triangle and the hinge-pieces being spaced apart opposite the button, a socket member carried by the window-sash, said member having an inverted-U-shaped socket in position to engage with the button on the stud member, and spurs projecting from the rear of the socket member on each side of the socket for assisting in holding the member to the sash, said socket members being projected in front and hollowed out at the rear to receive the head of the button without recessing the window-sash.

4. In a device of the character described, a lower and an upper window-sash, means whereby the lower sash may be swung about one of its edges, a plate secured to the rear side of the lower sash, said plate being concaved on its inner side and having a U-shaped notch opening upwardly therein, and a button secured to the upper sash above the said plate for the purpose specified, said button having a flange and a screw integral therewith, and said flange being provided with a hole for a screw by which the button may be prevented from turning.

709,588. ADJUSTABLE ELECTRIC-LAMP HANGER. HERMAN S. RENTSCHLER, Brooklyn, N. Y. Filed Nov. 20, 1901. Serial No. 83,033. (No model.)

Claim.—In an adjustable electric-lamp hanger, the combination of: a cylindrical vertical rod 7; two lazy-tongs arms 8 and 9 each pivoted and supported at one end on pivot-blocks 22 attached pivotally to the vertical rod; a cross-head block 16 to which the other ends of the two lazy-tongs arms are pivotally connected, said last aforesaid pivotal connections forming one and the same horizontal axis; two slotted adjusting-strips 12 one connected with each lazy-tongs arm near the cross-head block, one end of each of said adjusting-strips being riveted loosely together with two adjoining strips of lazy-tongs arms, a thumb-screw 14, provided with washer 15, passing through the slot in said strip and into the next two adjoining strips of the lazy-tongs arm; and a pair of insulated wires passing along the successive strips of one of the lazy-tongs arms and attached thereto by passing through holes provided with rubber bushings in ears 26, which ears form part of the metallic strips of the lazy-tongs, for the purpose specified and substantially as shown.

709,533.



709,534. LACING-HOOK FOR WOMEN'S SHOES OR THE LIKE. NEHEMIAH H. CLARK, San Francisco, Cal. Filed Feb. 12, 1902. Serial No. 93,801. (No model.)

Claim.—A lacing-hook for shoes comprising an eye portion arranged to be clamped in the shoe-upper, said eye portion having a flange, said flange having a straight extension therefrom of uniform thickness therewith in the same plane toward the edge of the upper, said extension forming the first part of the hook, said hook being then bent upwardly or parallel with the edge of the upper, but in the plane of the flange and in a straight line for a distance equal to the width of a flat lace, and then bent outwardly at a sharp angle also in the plane of the flange for a distance equal to the thickness of the lace to form a tooth, the whole hook thus formed being of uniform thickness with the flange, substantially as described.

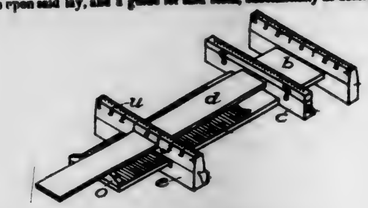
709,585. KINDERGARTEN-LOOM. LEVI H. COMSTOCK, Highland Park, Ill. Filed Feb. 16, 1901. Serial No. 47,642. (No model.)

Claim.—1. In a loom, the combination with a support, of oppositely-disposed blocks mounted thereon, means upon said blocks for engaging the warp-threads, a lay arranged to be reciprocated between said blocks and provided with means for beating up the weft-threads of a fabric being woven upon said loom, and means whereby said thread-engaging means upon said lay may, at will, be brought into the plane of said weft-threads or dropped below said plane, substantially as described.

2. In a portable hand-loom, the combination with a base-board, of pin-blocks adjustably mounted on said base-board with relation to each other, a lay mounted upon said base-board and adapted to be reciprocated between said pin-blocks, a stem upon said lay, and a guide for said stem, substantially as described.

3. In a loom, the combination with a base-board, of a pin-block

rigidly mounted thereon, a second pin-block slidably mounted upon said base-board, means for locking said second pin-block to said base-board, a lay slidably mounted upon said base-board and between said pin-blocks, a stem upon said lay, and a guide for said stem, substantially as described.



709,586. CLASP OR FASTENER. NEWTON CRANE, Boston, Mass. Filed Dec. 12, 1896. Serial No. 620,910. (No model.)

Claim.—1. A clasp or fastener comprising two complemental members, one being elongated with a plurality of engaging shoulders in its edges and the other having a transverse aperture to receive the first said member, said aperture being contracted at its front end whereby the end wall of the aperture provides shoulders b^3 to engage the said first-mentioned shoulders.

2. A clasp or fastener comprising two complemental members each formed of sheet metal and each having means at its outer end for attachment to a shoe or garment, one of said members being elongated with a plurality of engaging shoulders on its edges, and the other having an aperture between its ends to receive the first-mentioned member, said aperture being contracted at its front end to provide shoulders to engage the first-mentioned shoulders, whereby the elongated member may be passed through the aperture in the apertured member and by its engagement with both faces thereof be held with its shoulders in firm contact with the shoulders of the said apertured member.

3. A clasp or fastener comprising two complemental detachable members and an attaching-loop for one of said members, said loop consisting of a metallic strip doubled upon itself and being cut away to provide a resilient tongue with its end at or near the bend in the loop to normally hold said members in engagement.

4. A clasp or fastener comprising two complemental detachable members having engaging parts, one of said members having a cross-bar or pintle at its outer end, and an attaching-loop for encircling said cross-bar or pintle, said loop consisting of a metallic strip doubled upon itself and being cut away to provide a spring-tongue to bear against said cross-bar or pintle and hold said member in either of two positions.

5. A clasp or fastener comprising two complemental detachable members having engaging parts, one of said members having a cross-bar or pintle at its outer end, and an attaching-loop for encircling said cross-bar or pintle, said loop being formed of a single strip of resilient metal bent upon itself, and having a spring-tongue integral therewith extending into the space between its two portions, and bearing against said cross-bar, substantially as set forth.

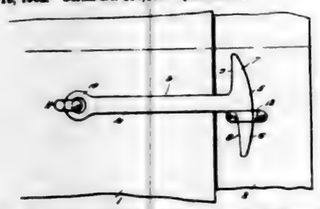
709,587. WIRE BUTTON. ROBERT A. PORTER, Detroit, Mich. Filed Apr. 9, 1902. Serial No. 102,071. (No model.)

Claim.—1. A button and its attaching means comprising a central head, a loop extending from one side of the head and pins extending from the opposite side of the head, said pins being bent upon themselves and returned beneath and behind the head for engagement with the loop.

2. A button and its attaching means consisting of a single wire including a loop, arches beyond the loop and lying in a common plane at an angle to the plane of the loop and pins extending from the ends of the arches opposite to the loop, said pins being bent upon themselves and returned beneath and behind the arches for engagement with the loop.

3. A button and its attaching means consisting of a wire bent upon itself to form separate members and a connecting portion, the wire adjacent to the connecting portion being bent to form a loop and the members beyond the loop being arched in opposite directions, and the members beyond the arches being bent upon themselves and returned to the loop for engagement therewith, the members between the loop and the arches being twisted together.

709,588. LATCH. CHRISTIAN GARBER, Findlay, Ohio. Filed May 19, 1902. Serial No. 107,935. (No model.)



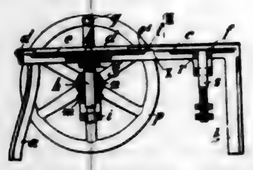
Claim.—1. In a latch of the character described, the combination, with a keeper-eye constituting one member of the latch, of a hook constituting the other member of the latch and comprising a shank, a connecting device rotatably mounted in the part to which the hook is applied, the shank of the hook being pivotally connected at one end to said connecting device, and being provided at its other end with oppositely-directed fixed heads or engaging members, the engaging edges of which are at different distances from the pivotal connection of the shank, said hook being reversible, substantially as described.

2. In a latch of the character described, the combination, with a pivoted hook constituting one member, of a keeper constituting the other member and consisting of an eye provided with an eccentric shank rotatably mounted in the part to which it is applied, the engaging edges of the eye being at different distances from the axis of the shank, substantially as described.

3. In a latch of the character described, the combination, with a keeper-eye constituting one member of the latch, said eye having an eccentric shank rotatably mounted in the member to which it is applied, and the engaging edges of the eye being at different distances from the axis of the shank, of a hook constituting the other member of the latch and comprising a shank, a connecting device rotatably mounted in the part to which the hook is applied, the shank of the hook being pivotally connected at one end to said connecting device, and being provided at its other end with oppositely-directed fixed heads or engaging members, the engaging edges of which are at different distances from the pivotal connection of the shank, said hook being reversible, substantially as described.

4. The combination, with a gate or door and gate-post or door-post, of a latch comprising a screw-eye mounted in the door, a hook having a shank provided at one end with an eye to engage the screw-eye and having at its other end oppositely-directed fixed heads with engaging edges at different distances from the screw-eye, and a keeper consisting of an elongated eye having an eccentric threaded shank to engage the post, substantially as described.

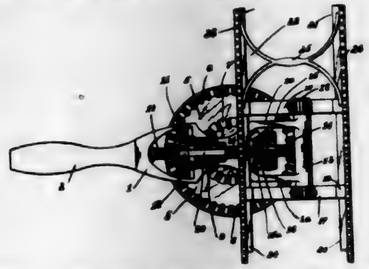
709,589. MACHINE FOR CUTTING MEAT, &c. FRIEDRICH GRAFF, Wiken, Germany. Filed May 2, 1902. Serial No. 105,667. (No model.)



Claim.—1. In a meat-cutting machine, the combination of a frame with a cover depressed in the middle, a circular knife rotating between them, a table *f* which also serves as a gage, means for vertically adjusting said table, and mechanism for rotating the said knife substantially as set forth.

2. In a meat-cutting machine, the combination of a table-like frame with a fixed cover having a depressed middle part, a rotary circular knife arranged between said frame and the depressed part and the said cover, a spindle carrying the said knife, a driving-shaft and gearing for operating the said spindle, a vertically-adjustable piece arranged in proximity to the said knife and serving as a gage, a screw-spindle supporting the said piece, a nut engaging the threads on the latter and a fixed device for contact with the said nut, in order that the turning of the latter may adjust the said piece higher or lower substantially as set forth.

709,540. MACHINE FOR WEAVING CROSS-WIRES IN FENCES. WILLIAM GROVES and GRANVILLE D. O'DAY, Mount Sterling, Ohio. Filed Jan. 8, 1902. Serial No. 88,821. (No model.)



Claim.—1. In a machine for weaving cross-wires in fences, the combination with a vertically-arranged frame 22 adapted to be slidably supported upon the horizontal wires of a fence, of a main machine-bar 1, a fence gear-wheel journaled in connection therewith and having an inner and an outer row of gear-teeth on its face, a horizontally-journaled shaft in front of said wheel, a pinion-wheel 11 carried on said shaft and a double bevel-wheel 15 slidably mounted on said shaft, a longitudinally-recessed weaver-tube supported from said bar 1, a correspondingly-recessed gear-wheel 11 connected with said weaver-tube, a wire-spool-carrying pin projecting from said gear-wheel, and a swinging connection of the bar 1 with the supporting-frame 22, substantially as specified.

2. In a machine for weaving cross-wires in fences, the combination with a vertically-arranged frame 22 comprising connected angular standards 24 and toothed bars 26 projecting from said standards, of a weaving-machine comprising a main bar, a recessed weaver-tube projecting therefrom and means for imparting rotary motion to said tube, a frame or gate 17 pivotally connected with one end of said bar, said gate having laterally-recessed corner portions adapted to receive loosely the interned wings or flanges of said standards 24, and friction-wheels 21 journaled within said gate corner portions, as and for the purpose set forth.

709,541. APPARATUS FOR THE MANUFACTURE OF MOLDERS' CHAPLETS. ROBERT B. HASKINS, Cincinnati, Ohio. Filed May 7, 1902. Serial No. 106,308. (No model.)

Claim.—1. In an apparatus for the manufacture of molders' chaplets or anchors, a die formed of a metal bar or rod of flattened form in cross-section, the end of which is provided with an open-ended slot or kerf extended through it from one flattened side to the other to receive the end of a blank and box on opposite sides of said slot or kerf, side portions about which the blank is adapted to be bent, substantially as set forth.

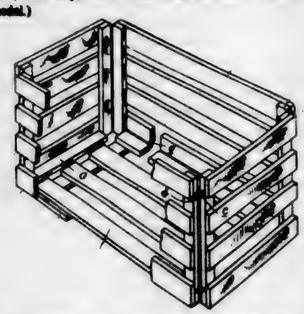
2. In an apparatus of the character described, the combination of a die having a slot or kerf to receive an end of a blank and provided at the sides of said slot or kerf with side portions about which said blank is adapted to be bent, a matrix having an opening adapted to receive the die and blank carried thereon and a press-plate above the matrix for forcing the die and blank into the opening of the matrix, substantially as set forth.

3. In an apparatus of the character described, the combination of a die having a slot or kerf to receive an end of a blank and provided with side portions at the sides of said slot or kerf and about which the blank is adapted to be bent, a matrix having an opening to receive the die and blank carried thereon and a spring-supported press-plate above the matrix for forcing the die and blank into the opening of the matrix, substantially as set forth.

4. In an apparatus for the manufacture of molders' chaplets or anchors, a die having an opening extended through it to receive each end of a blank, and devices between which said die is adapted to be pressed, one of said devices having means for forcing one end of the blank through its opening, substantially as set forth.

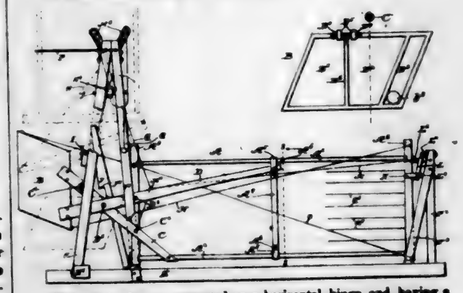
5. In an apparatus for the manufacture of molders' chaplets or anchors, a die having an end portion formed with flattened sides and having two openings extended through it from one flattened side to the other, each of said openings being adapted to receive an end of a blank and said end portion of the die having at opposite sides of said openings side portions about which each blank is adapted to be bent, substantially as set forth.

709,542. FOLDING CRATE. CHARLES W. HELLER and EVERLY A. JOSEPH, Coon City, Mich. Filed May 13, 1902. Serial No. 107,880. (No model.)



Claim.—A folding crate, comprising end and side sections hinged one to another at their ends to form when unfolded an oblong rectangular inclosure, each section being composed of a series of horizontally-extending spaced slats connected at their ends by vertical cleats arranged upon the inner faces of the sections, a bottom section, comprising similarly-arranged slats and cleats, hinged to the lower edge of one of the sides, said bottom fitting between the cleats on said side and folding into parallelism and contact therewith, a supporting-strip upon the lower edge of the opposite side fitted between the vertical cleats thereon, and a bridging-strip fitted between the cleats on each end section and projecting inwardly from the lower edge thereof, as and for the purpose set forth.

709,543. GATE. TERRELUS A. HILL, Maryville, Tenn. Filed Oct. 24, 1901. Serial No. 80,366. (No model.)



Claim.—1. A gate supported on a horizontal hinge and having a counterbalance and oblique braces, C and D, crossing each other and having their ends joined to said counterbalance and the gate, substantially as described.

2. A gate supported on a horizontal hinge and having a counterbalance and oblique braces, C and D, crossing each other and having their rear ends joined to said counterbalance and having their forward ends joined to the top and bottom rails of the gate, substantially as described.

3. A gate supported on a horizontal hinge and having a counterbalance and oblique braces, C and D, crossing each other and joined to each other where they cross and having their ends joined to said counterbalance and the gate, substantially as described.

4. A gate supported on a horizontal hinge and having a counterbalance and oblique braces, C and D, crossing each other and joined to each other where they cross, and having their rear ends joined to said counterbalance and their forward ends to the top and bottom rails, substantially as described.

5. A gate supported on a horizontal hinge and having a counterbalance and oblique braces, C and D, crossing each other and having their rear ends joined to said counterbalance and having the portions forward

of the point of crossing jointed to the rear upright and the top and bottom rails, substantially as described.

6. A gate supported on a horizontal hinge and having a counterbalance and oblique braces, C and D, crossing each other and jointed to each other where they cross and having their rear ends jointed to said counterbalance and having the portions forward of the point of crossing jointed to the rear upright and the top and bottom rails, substantially as described.

7. In a gate, the combination with the gate-frame, of a counterbalance, and two pairs of braces extending obliquely from said counterbalance to said gate-frame and crossing each other, and a horizontal hinge-shaft extending through two of said braces, substantially as described.

8. In a gate, the combination with the gate-frame, of a counterbalance, and two pairs of braces extending obliquely from said counterbalance to said gate-frame and crossing each other, a horizontal hinge-shaft extending through two of said braces, two posts, one located at each side of the gate and supporting said shaft, and a bar, I, connecting said posts above said braces, substantially as described.

9. The combination with a gate-frame, counterbalance, and braces connecting said counterbalance and frame, posts, F, and a bar, I, connecting said posts, of a latch-bar adapted to engage said bar and to hold said gate in the upright position, substantially as described.

10. The combination with a gate-frame and posts to which said gate is hinged, of a latch-bar hinged to said gate-frame, and a member suitably secured to said posts for making engagement with said latch-bar when the gate is in the upright position, substantially as described.

11. A gate supported on a horizontal hinge and having a counterbalance-chest comprising two compartments which are at opposite sides of a plane cutting said gate lengthwise and near which said hinge lies, and a third compartment adapted to receive a freely-shifting weight, substantially as described.

12. A gate supported on a horizontal hinge and having a counterbalance-chest comprising two compartments which are at opposite sides of a plane cutting said gate lengthwise and near which said hinge lies, and a third compartment having its ends adjacent to vertical lines extending through the hinge of the gate when the latter is opened or closed, substantially as described.

13. In a gate, the combination of the posts, F and F', shaft, *f*, arm, H, an operating-cord, staple, *f'*, and a guy, substantially as described.

14. In a gate, the combination of the posts, F and F', arm, H, suitably hinged to said posts, and two guys, both joined to said posts, and one joined to the outer end of said arm and the other near the middle of the latter, and an operating-cord, substantially as described.

15. The combination with a gate supported on a horizontal hinge, of a latch-bar secured vertically to the rear end of said gate and arranged to bear against the rear end of the latter when the latch has been released, and a cord attached to said latch-bar and arranged for lifting the latter whereby the gate is released and turned from the upright position, substantially as described.

16. The combination with the gate-frame and latch-bar secured to the rear portion of said frame, posts, F and F', arm, H, and suitable pulleys secured upon the outer end of said arm and upon said posts, of a cord extending from the rear portion of said gate upward and over a pulley on said posts, thence around the pulley on the outer end of said arm, thence over a pulley on said posts, and thence downward to said latch-bar, substantially as described.

17. In a gate, the combination with two posts, one standing at each side of the gate, of plates, Q, attached to the inner faces of said posts and having upturned ends having apertures, Q', substantially as described.

18. The combination with a gate-frame having a latch mounted thereon at each end, of posts and a cord-supporting arm, and duplex cords each extending from the outer end of said arm, one to one and the other to the other of said latches, substantially as described.

19. In a gate, the combination with the gate-frame, counterbalance, and two pairs of rigid braces crossing each other and jointed by their ends to said frame and said counterbalance, of a pair of wire braces, N, jointed to the lower portion of said counterbalance and to the upper, outer portion of said frame, substantially as described.

20. In a gate, the combination with a frame and counterbalance, and two pairs of rigid braces crossing each other and jointed by their ends to said counterbalance and frame, of a wire brace extending from the upper portion of said counterbalance to the lower forward corner of said frame, substantially as described.

21. In a gate, the combination with a gate-frame, a counterbalance, two pairs of oblique braces joining said counterbalance and frame, posts, F, F, supporting said gate, and a bar, I, connecting said posts above said braces, of a wire brace extending from the upper portion of said counterbalance over said bar, I, to the lower forward corner of the gate-frame, substantially as described.

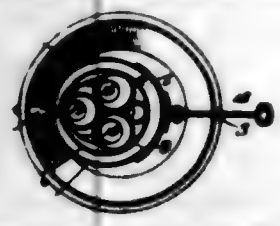
22. In a gate, the combination with a frame and counterbalance, and a pair of braces rigidly joining said counterbalance and frame, of a pair of wire braces jointed to the front of the gate and extending along opposite sides of the latter and crossed between the gate-frame and counterbalance and then attached to the counterbalance, substantially as described.

709,544. ADHESIVE. ARTHUR S. HOYT, Brooklyn, N. Y. Filed June 5, 1901. Serial No. 62,258. (No specimens.)

Claim.—1. A new adhesive, containing the solid matter from gluten-water of wheat-starch manufacture concentrated, cooked and reduced to dryness, the same consisting of a mixture of converted starch and albumen forming a soluble powder.

2. A new adhesive containing the solid matter from gluten-water of wheat-starch manufacture, concentrated, cooked and reduced to dryness, the same consisting of a mixture of converted starch and albumen forming a slightly-colored powder soluble in cold water.

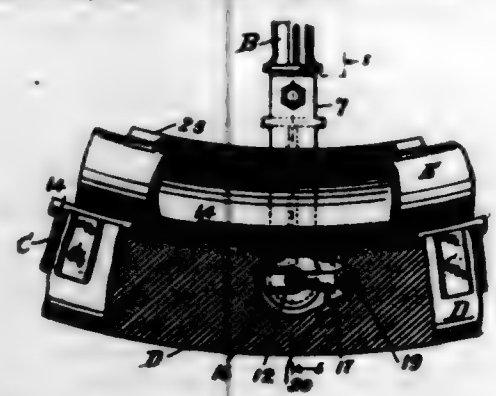
709,545. STOVEPIPE ATTACHMENT. JOHN C. HOYT, Richmond, Me. Filed Oct. 18, 1901. Serial No. 79,209. (No model.)



Claim.—1. A stovepipe attachment, comprising a stovepipe, an upwardly-tapering tube therein; said tube being pitched or inclined rearwardly from its lower to its upper end, and having its lower end fitting tightly in and of substantially the same area as the lower end of the pipe, and its upper end of much smaller diameter than the pipe, and provided in its front side with a vertically-elongated opening, a damper controlling said opening, a handle connected to the damper and projecting through the inclosing pipe, and a smaller tube secured within the lower portion of the tapering tube and containing a nest of smaller tubes or nozzles; said smaller tubes or nozzles tapering upwardly likewise.

2. A stovepipe attachment, comprising a stovepipe, an upwardly-tapering tube therein and pitched or inclined rearwardly from its lower to its upper end and provided with a vertical elongated opening in its front side, the lower end of said tube being of substantially the same diameter as the contiguous part of the pipe, while its upper end is of smaller diameter than the contiguous portion of said pipe, a bolt connecting the rear sides, of the pipe and tube, a sleeve upon said bolt and separating the pipe and tube, a damper 9, controlling the elongated opening of the tube, and hinged at its lower end to the tube contiguous to the lower margin of said opening, and a handle pivoted to said damper and projecting forwardly through the pipe, and provided with a plurality of notches to engage said pipe and secure the damper in the desired position.

709,546. VEHICLE-WHEEL. GEORGE S. LEE, Hawthorne, N. J. Filed Jan. 27, 1902. Serial No. 91,498. (No model.)



Claim.—1. The combination with a hub, spokes and rim rigidly connected together, of a pneumatic tube on said rim, a tire on said rim adapted to have an eccentric curvilinear motion around the rim within a limited range to compress said tube, and stops on the rim to limit the range of motion of the tire.

2. In a vehicle-wheel a spoke having a forked outer end adapted to span a tire and made in two separable pieces bolted together, substantially as shown.

3. In a vehicle-wheel, a spoke having a forked outer end adapted to span a tire and made in two pieces one of which is integral with the body of the spoke and the other is separable therefrom but secured thereto.

4. In a vehicle-wheel, the combination with a tire and rims C C of a spoke B having a fork at its outer end which spans said rims C C, said

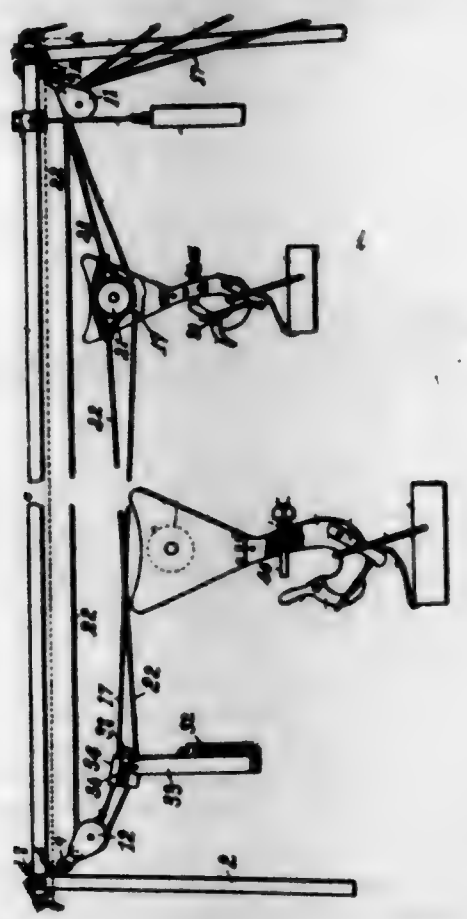
fork being in two separable pieces which are bolted together through said rims and also nearer the center of the wheel.

5. In a vehicle-wheel, the combination of the two-part forked spokes, the saddle 25, pneumatic tube E, rim C and movable tire D.

6. The combination with the hub, spokes and rim, of a chambered tire, and forked levers pivoted in the tire and engaging pins on the spokes to permit of limited movement of the tire on the rim.

7. The combination with a hub, spokes and rim, of a chambered tire and devices in the tire adapted to permit of limited motion thereof on the rim.

709,547. **HOISTER AND CONVEYER.** GEORGE W. MERRITT, Berkeley, Cal. Filed Apr. 16, 1902. Serial No. 103,282. (No model.)



Claim.—1. In an apparatus of the character described, the combination of pulley-blocks, means for securing the same at a distance from each other, two cables attached to one of said blocks and running over pulleys in the other block, a carrier having rollers running on said cables, a rope attached to said carrier, a pulley on the block to which the cables are attached and between said cables around which passes the rope attached to the carrier, and two pulleys between the pulleys of the other block around which pass the aforesaid rope and a second rope also attached to said carrier, substantially as described.

2. In an apparatus of the character described, the combination of two pulley-blocks, means for securing said blocks at a distance from each other, two truck-cables attached to one of said blocks and passing over pulleys in the other block, a carrier having rollers running upon said cables, ropes for drawing said carrier, a trip for said hook, a hanger, and a frame for said hanger attached to the cables and having a pulley about which passes one of said ropes, said hanger being in the path of the trip to release the device carried by the hook, substantially as described.

3. In an apparatus of the character described, a carrier having a hook, a trip pivoted on said hook and having a forwardly-projecting lower end and a recess in its upper edge, a guideway for a rope loop, in combination with the bucket having a bail around said hook, and a rope loop passing through said guideway and engaging said trip in said recess, substantially as described.

4. In an apparatus of the character described, a carrier having a hook, a trip pivoted on said hook, a guide-passage through said hook, a spring-actuated stem passing through said passage, the end of said stem engaging said trip, whereby on contact of the head of said stem with an obstacle, said trip is sprung to release the device carried by the hook, substantially as described.

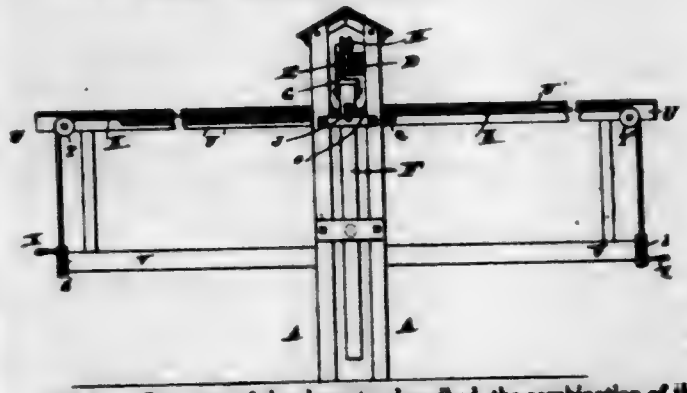
5. In an apparatus of the character described, the combination with two truck-cables and a carrier thereon having a trip, of a V-shaped hanger-frame, the ends of said V being bent back on themselves to secure the same around the cables, a roller pivotally secured in said V, and a hanger supported by said frame, and in the path of the carrier-trip, substantially as described.

6. In an apparatus of the character described, the combination with two truck-cables and a carrier thereon having dividing-plates and a trip, of a hanger suspended from said cables, having a plate against which the trip abuts, said hanger having also a protector at its upper portion against which the corners of the plates of the carrier impinge, substantially as described.

7. The union comprising the W-shaped frame having two thimbles in its upper portion and cable ends secured in said thimbles, and a single thimble in its lower central portion and a chain or rope secured in said lower thimble, substantially as described.

8. In an apparatus of the character described, the combination of a strainer-beam, a pulley-block supported thereby, cables passing said block, a carrier on said cables having a hook, a striker-plate suspended from said strainer-beam, and a tripping device carried by said hook arranged to impinge against said striker-plate to release the load, substantially as described.

709,548. **GATE.** JOHN MEYER, Yuton, Ill. Filed Mar. 27, 1902. Serial No. 100,242. (No model.)



Claim.—In a gate of the character described, the combination of the gate mounted to slide on an overhead track, a catch J at each end of the gate, a keeper L for each catch, a rope K attached at one end to one of the catches, pulleys secured to the center posts of the supporting structure, beams U projecting at right angles to the length of the gate, the pulleys T thereon, the beams V below the said beams U, the pulleys S thereon, the said rope K passing over the pulleys on the center posts, thence over the pulley T of the beam U, thence down and around the pulley S, thence up over pulley T and back to the center posts and over pulleys thereat, thence to the catch J on the opposite end of the gate from which the rope started all arranged to operate as described, and the springs Y at each end of the movement of the gate, the same adapted to be put under tension whereby when released they assist in throwing the gate as set forth and described.

709,549. **MOTOR ATTACHMENT FOR CYCLES.** LEONARD H. MEYRICK-JONES, East Dereham, England. Filed Sept. 30, 1901. Serial No. 76,777. (No model.)

Claim.—1. The combination of two bicycles, a set of clamps engaging their frames, a second set of clamps adjustably carried by the first set, and a motor-frame carried by the second set of clamps.

2. In a motor attachment for cycles, the combination of a set of clamps engaging the bicycle-frames, a second set of clamps adjustably carried by the first set, longitudinal bars carried by the second set, a motor carried by the longitudinal bars, and means for driving the bicycle-wheels from the motor.

3. In a motor attachment for cycles, the combination of a set of clamps engaging the bicycle-frames, a second set of clamps adjustably carried by the first set, longitudinal bars carried by the second set, a motor carried by the longitudinal bars, a shaft driven by the motor, and pinions on the shaft engaging pinions on the hubs of the bicycle-wheels.

709,550. **MOTOR ATTACHMENT FOR CYCLES.** LEONARD H. MEYRICK-JONES, East Dereham, England. Filed Jan. 21, 1902. Serial No. 90,068. (No model.)

Claim.—1. The combination of two bicycles, a framework connected to the frame of both bicycles by clamps and coupling them side by side at a distance apart, a road-wheel carried by the framework and a motor driving this wheel also carried by the framework.

2. The combination of two bicycles, a framework connected to the frame of both bicycles by clamps and coupling them side by side at a distance apart a road-wheel carried by the framework, springs acting to press downward this road-wheel and a motor driving the road-wheel.

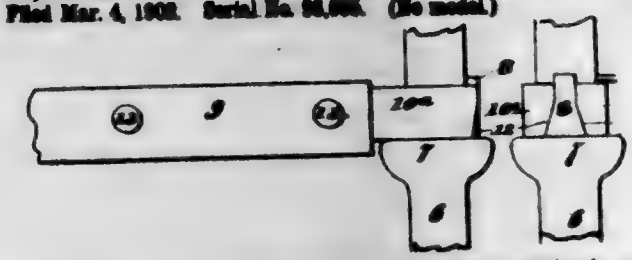
3. The combination of two bicycles side by side at a distance apart, a tie-rod, clamps at its ends secured to the two bicycle-frames, a road-wheel mounted upon and capable of being revolved around the rod, a motor attached to the rod and driving the wheel, stays extending from the rod to the ends of the bicycle-frames and a tie-bar holding apart the ends of these frames.

4. The combination of two bicycles side by side at a distance apart, a tie-rod, clamps at its ends secured to two bicycle-frames, a road-wheel mounted upon and capable of being revolved around the rod, a motor attached to the rod and driving the wheel, portions of the rods formed as springs to force the road-wheel against the ground, a tie-bar holding apart the ends of the bicycle-frames and cross-stays for keeping the rod and tie-bar at right angles to the bicycle-frames.

5. In a motor attachment for bicycles the combination of a rod, a road-wheel mounted upon and capable of being revolved around the rod, a motor attached to the rod and driving the wheel, a clamp at one end of the rod by which it can be attached to the bicycle-frame so as to stand out sidewise at right angles to it, and a stay fast at one end with the rod and at the other adapted to be secured to the bicycle-frame.

6. In a motor attachment for bicycles the combination of a rod, a road-wheel mounted upon and capable of being revolved around the rod, a motor attached to the rod and driving the wheel, a clamp at one end of the rod by which it can be attached to the bicycle-frame so as to stand out sidewise at right angles to it, a portion of the rod formed as a spring to force the road-wheel against the ground, and a stay fast at one end with the rod and at the other adapted to be secured to the bicycle-frame.

709,551. METAL BEDSTEAD. JOSEPH A. MOLLITOR, Chicago, Ill. Filed Mar. 4, 1902. Serial No. 96,995. (No model.)



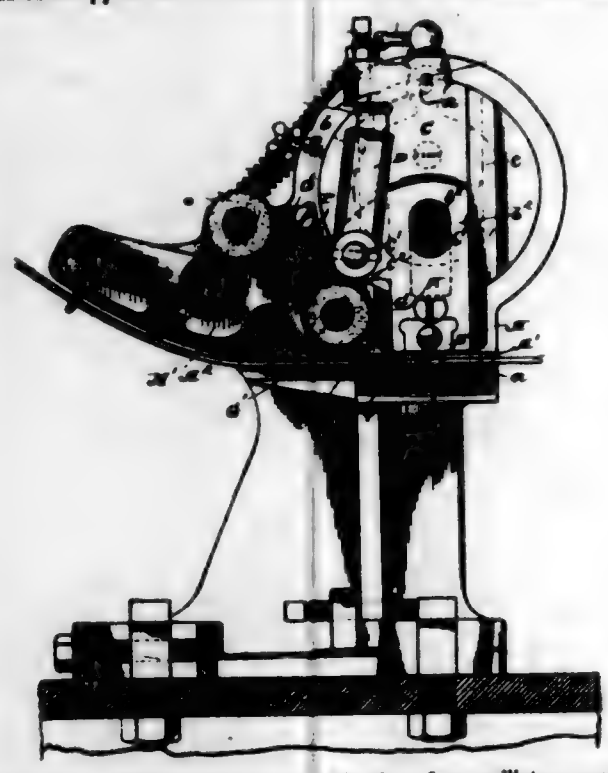
Claim.—1. In a corner-fastening for bedsteads, the combination with a corner-post and a side rail, of a lug on the corner-post, plates embracing said corner-post and abutting against the aforesaid lug, said plates being secured to the side rail, substantially as shown and described.

2. In a corner-fastening for bedsteads, the combination with a corner-post, of a lodge and lug thereon, plates supported on said lodge embracing the corner-post and abutting against the aforesaid lug, said plates being secured to the side rail, substantially as shown and described.

709,552. PRINTING DEVICE. WILLIAM L. MORRIS, Cleveland, Ohio, assignor to the Austin Cartridge Company, Cleveland, Ohio, a Corporation of Ohio. Filed Mar. 13, 1899. Serial No. 708,802. (No model.)

Claim.—1. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said oscillatory support, means for imparting an oscillatory movement to said support, and a reciprocating movement to said carrier, and means for causing a partial reciprocating stroke in one direction prior to the return oscillatory stroke, whereby the position of the carrier relative to said support will be different during the two oscillatory strokes.

2. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted on said support, means for reciprocating said carrier, means for oscillating said support intermittently intermediate the reciprocating movements, a partial reciprocating movement in one direction being provided prior to the return oscillatory stroke, and means for preventing oscillation during the initial and final strokes of the reciprocating movement of said carrier, whereby the position of the carrier relative to said support will be different during the two oscillatory strokes.



3. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said support, means for oscillating said support and carrier, means for imparting a sliding movement in one direction prior to one oscillatory stroke, and means for imparting a sliding movement of a length less than the full reciprocating movement and in the opposite direction prior to the opposite oscillatory stroke, whereby the position of the carrier relative to said support will be different during the two oscillatory strokes.

4. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said support, means for oscillating said support and carrier, means for imparting a sliding movement in one direction prior to one oscillatory stroke, and independent means for imparting a sliding movement only in the opposite direction prior to the opposite oscillatory stroke.

5. In a printing device, the combination of a type-carrier capable of oscillation, means for effecting such oscillation, means for imparting a sliding movement to said carrier prior to one oscillatory stroke, and a spring adapted to impart to said carrier a movement in a direction opposite to that of said sliding movement, substantially as set forth.

6. In a printing device, the combination of a type-carrier capable of oscillatory and reciprocal movement, means for effecting such oscillation, means for imparting a sliding movement to said carrier prior to one oscillatory stroke of said carrrier, and a spring for imparting a sliding movement to said carrier prior to the other oscillatory stroke, substantially as set forth.

7. In a printing device, the combination of a type-carrier suitably mounted and capable of an oscillatory and reciprocal movement, a guide adapted to contact said carrier whereby one reciprocating stroke may be effected, said guide located in a manner such that it may be disengaged from said carrier, and an actuating-arm journaled upon said carrier eccentrically whereby reciprocation of said carrier may be effected during such contact and oscillation of same effected during such disengagement, substantially as set forth.

8. In a printing device, the combination of a type-carrier suitably mounted and capable of an oscillatory and a reciprocating movement, means for effecting such movement and a roller for engaging said carrier and adapted to prevent oscillation during one reciprocal movement thereof, substantially as set forth.

9. In a printing device, the combination of a support, a type-carrier suitably mounted upon said support and capable of a reciprocating movement, means for oscillating said support and reciprocating said carrier, and a roller for engaging said carrier and adapted to prevent oscillation of said support during one reciprocal movement of said carrier, substantially as set forth.

10. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said support, means tending to retain said carrier, a guide-roller for engaging the latter, and means for withdrawing same from contact with said roller, whereby said retaining means are rendered operative, substantially as set forth.

11. In a printing device, the combination of an oscillatory support,

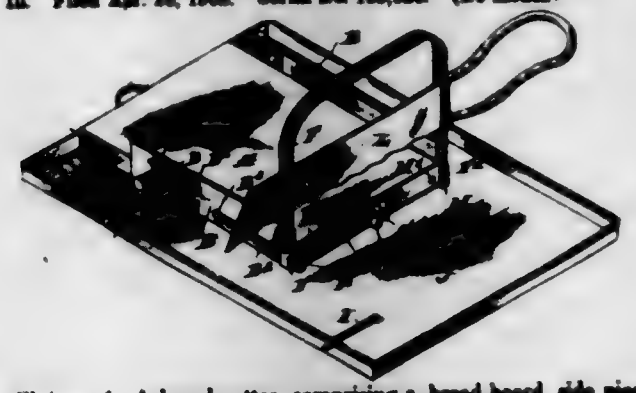
a type-carrier slidably mounted upon said support, driving means journaled without the axial plane perpendicular to said carrier, a guide-roller for engaging said carrier, the latter adapted to be withdrawn from contact with said roller by said driving means, whereby the carrier may be rotated, substantially as set forth.

12. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said support, means for imparting an oscillatory and a reciprocating movement to said carrier, type carried thereby, and relatively stationary inking means located in the path of movement of the type and adapted to ink the same during but one of the oscillatory movements of the carrier, said type being out of contact with the inking means during the opposite oscillatory stroke.

13. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said support, means for oscillating said carrier, an ink-roller, and means for rotating said roller during one stroke of the oscillatory movement of the said carrier, said means being inoperative during the other oscillatory stroke, substantially as set forth.

14. In a printing device, the combination of an oscillatory support, a type-carrier slidably mounted upon said support, driving means journaled without the axial plane perpendicular to said carrier, a guide-roller for engaging said carrier, the latter adapted to be withdrawn from contact with said roller by said driving means, whereby said carrier may be rotated, and means for limiting such rotation, substantially as set forth.

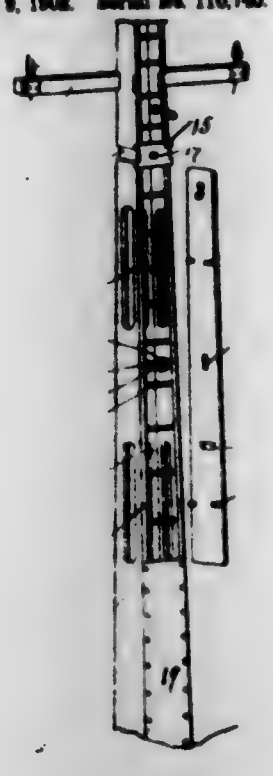
709,553. BREAD-CUTTER. WILLIAM O. H. MORRISON, Belvidere, Ill. Filed Apr. 28, 1902. Serial No. 105,080. (No model.)



Claim.—1. A bread-cutter, comprising a bread-board, side pieces, projecting above the board and slidably connected with the edges thereof, a longitudinally-slotted knife-guide mounted, by its ends, on the side pieces, substantially as and for the purpose specified.

2. A bread-cutter, comprising a bread-board, side pieces projecting above the board and slidably connected with the edges thereof, a longitudinally-slotted knife-guide mounted, by its ends, on the side pieces, and a vertically-slidable end piece connected with the inner end of the board—said side pieces and end piece serving as stops to retain a loaf of bread in position on the board while slices are being cut therefrom—substantially as and for the purpose specified.

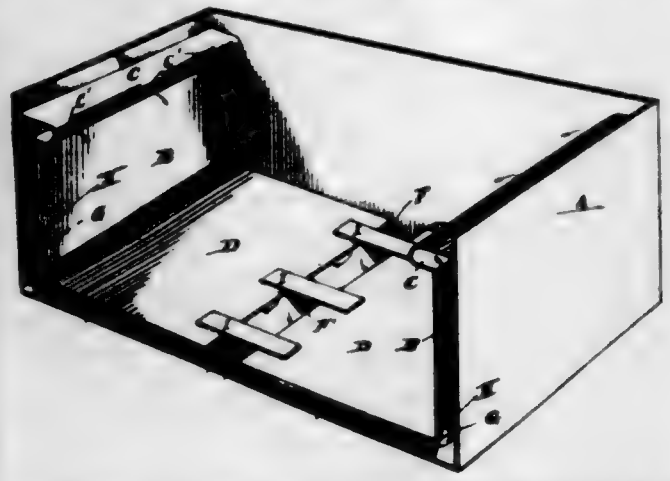
709,554. ELECTRIC-WIRE POLE. BERT MCFARREN, Havana, Ohio. Filed June 9, 1902. Serial No. 110,745. (No model.)



Claim.—1. As an improved article of manufacture a pole for electric wires formed of metal and provided with integral flanges and open upon one of its sides, rungs or bars secured to the flanges of the pole, a cover-plate removably attached to the pole and located over all or part of the rungs or bars, and means for securely holding the cover-plate in fixed relative position with the pole, substantially as and for the purpose specified.

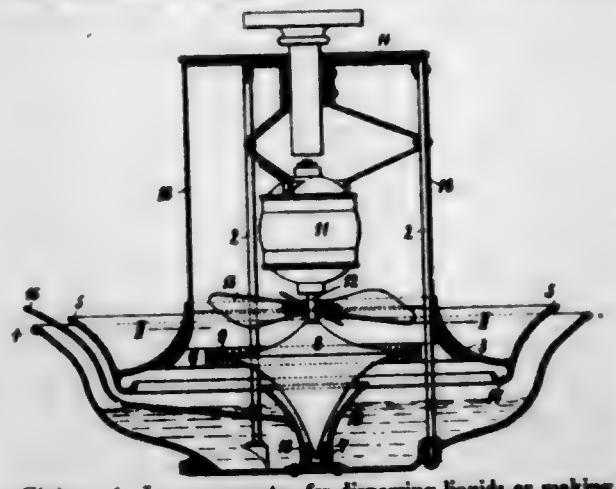
2. A pole for electric wires provided with an open side, rungs secured to the pole, a bar or bolt provided with an apertured head, said bolt fixed to the pole, a cover-plate normally located over the open side of the pole and a lock adapted to secure the cover-plate in fixed position upon the pole, substantially as and for the purpose specified.

709,555. WASHBOILER. JOHN I. POWERS, Peoria, Ill. Filed Mar. 27, 1902. Serial No. 100,256. (No model.)



Claim.—In a washboiler, the tank A of rectangular form, the fixed false ends therein at each end, the same leaving spaces between them and the ends proper of said tank, the enlarged heads at the top of the said false ends, the same having apertures therein for the issuance of water as described, said ends extending down toward the bottom of the tank but leaving a space between them and said bottom, and the removable false-bottom portions adapted to enter the spaces between the false ends and the ends of the tank and interlock with the said false ends, said false-bottom portions arranged to approach each other but leave a space between them all for the purposes set forth and described.

709,556. APPARATUS FOR DISPERSING LIQUIDS OR MAKING SPRAY. CARL H. PROTT, Rheydt, Germany. Filed June 14, 1902. Serial No. 111,631. (No model.)

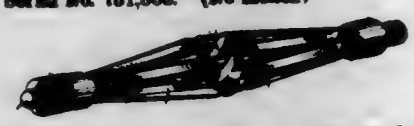


Claim.—1. In an apparatus for dispersing liquids or making spray a basin 1 containing the liquid to be dispersed in combination with a paraboloid-shaped body 8 ending in a horizontal disk 9, a pan or bearing 7 carrying the foot of said paraboloid, a spindle 12 at top of the paraboloid, a fan 13 keyed to said spindle, an electromotor driving said spindle and the paraboloid, columns 2 fixed to the bottom of the basin 1, a U-shaped trough 3 fixed to said columns centrally over the basin 1, so as to leave an annular space between the side of the basin 1 and the outside edge of the trough, a series of radial wings 6 forming coils and arranged exactly in the level of the disk 9 at the inner side of the trough 3, the whole as described and illustrated and for the purpose set forth.

2. In an apparatus for dispersing liquids or making spray a basin 1 containing the liquid, columns 2 fixed to the bottom of said basin, a U-shaped trough 3 fixed to said columns centrally over the basin so as to leave an annular space between the side of the basin 1 and the outer edge

of the trough 3, a channel 17 at the foot of the trough 3, wings 6 projecting radially inward from the inner side of the trough, in combination with a rotating paraboloid shaped body 8 guided in a pan 7 fixed to the bottom of the basin 1, a spindle 12 projecting upward from the top of the paraboloid 8, a fan 13 keyed to said spindle, an electromotor coupled to the spindle and driving the same at a high speed, a perforated casing 18 surrounding the upper part of the apparatus, a cover 14 at top of said casing 18, an adjustable casing 10 surrounding the lower part of the paraboloid and the pan 7, slits 16 in said casing 10 and in the pan 7, a hand-lever 15 for adjusting the width of opening of the slits 16 and regulating the flow of liquid into the space inside of the casing 10, the whole as described and illustrated and for the purpose set forth.

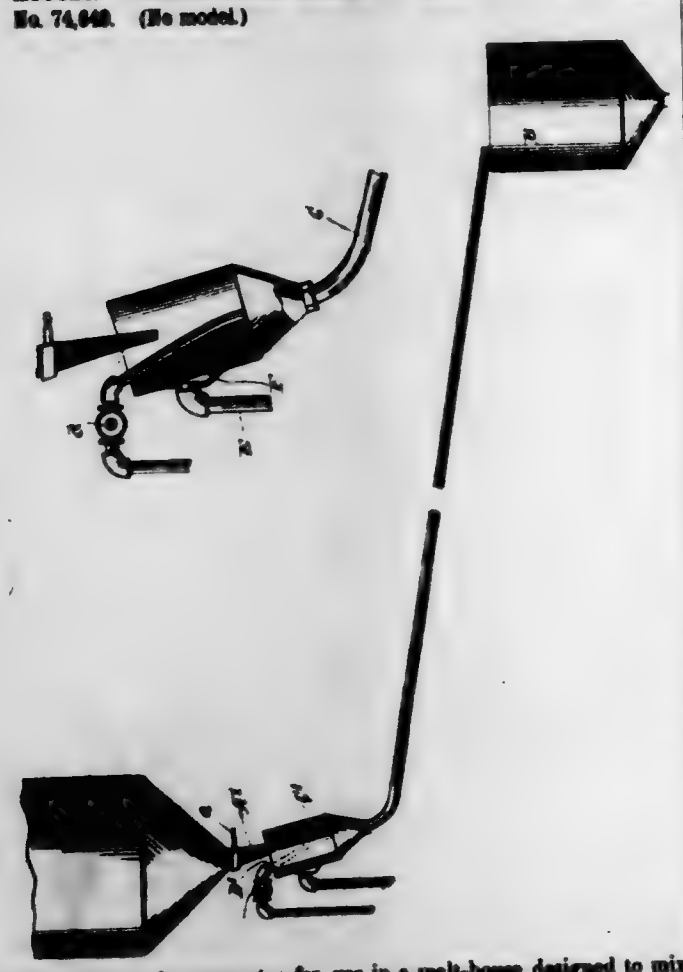
709,557. CLEANER FOR GUNS. EDWIN A. PUGH, Springfield, Ill., assignor of one-half to Charles A. Orr, Springfield, Ill. Filed Sept. 22, 1899. Serial No. 731,306. (No model.)



Claim.—1. A cleaner for guns, &c., consisting of a tool provided with a series of longitudinally-extending, flexible bars, each having intermediate its ends a portion extending crosswise of the tool to form a scraper, and each bar, intermediate its ends being concavo-convex in cross-section, substantially as and for the purpose described.

2. In a cleaner, the combination of a rod, two collars thereon, a series of bars interposed between said collars, having longitudinally and obliquely extending portions, said bars being flat, or substantially flat in cross-section adjacent the collars, and concavo-convex in cross-section at other points, and means for moving one collar along the rod relative to the other, substantially as and for the purpose described.

709,558. APPARATUS FOR CONVEYING GRAIN IN MALT-HOUSES. WILLIAM P. RICE, Chicago, Ill. Filed Sept. 7, 1901. Serial No. 74,642. (No model.)



Claim.—1. An apparatus for use in a malt-house designed to mix grain and water and to thereafter convey the same to a steeping-tank for the purpose of steeping the grain comprising, in combination with a steeping-tank, a pipe or conduit, means for delivering grain to said pipe or conduit, means for delivering water thereto, said pipe or conduit being inclined downwardly from its receiving to its discharge end and emptying directly into said tank, whereby the admixture of grain and water is conveyed by gravity through said pipe or conduit, is discharged into said tank and the grain is steeped in the water admixed therewith in said pipe.

2. The combination with a grain-bin and a steeping-tank, of means for conveying to said tank grain and water comprising a supply-passage leading from the grain-bin, a pipe or conduit leading from the bin to the said tank and which receives grain from said supply-passage, a water-supply pipe discharging into the receiving end of said pipe or conduit, said pipe or conduit being inclined downwardly from its receiving to its discharge end and emptying into said tank, and means for controlling the supply of grain and water to said pipe or conduit, whereby the grain and water may be delivered in desired proportionate quantities to the receiving end of the said pipe or conduit and will be conveyed by gravity through said pipe or conduit and discharged together into said tank.

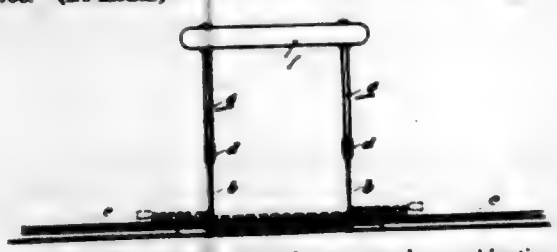
3. The combination with a grain-bin provided with a discharge-spout and a steeping-tank, of means for conveying grain and water to said tank comprising a pipe or conduit which leads to said tank and into which said bin-spout discharges, and a water-pipe entering said pipe or conduit adjacent to the bin-spout and passing downwardly thereinto below the discharge end of said bin-spout, said pipe or conduit being inclined downwardly from its receiving to its discharge end and emptying into said tank, whereby the admixture of water and grain is conveyed by gravity through said pipe or conduit and is discharged into said tank.

4. The combination with a grain-bin and a steeping-tank, of a pipe or conduit which receives grain from said bin and discharges into said tank, a water-pipe discharging into the receiving end of said pipe or conduit, said pipe or conduit being inclined downwardly from its receiving to its discharge end whereby the grain and water is conveyed to the tank by gravity, and an overflow-pipe connected with the receiving end of said pipe or conduit.

5. The combination with a grain-bin and a steeping-tank, of a pipe or conduit which receives grain from said bin and discharges into said tank, a water-pipe discharging into the receiving end of said pipe or conduit, said pipe or conduit being inclined downwardly from its receiving to its discharge end, whereby the grain and water is conveyed to the tank by gravity, an overflow-pipe connected with the receiving end of said pipe or conduit, and a screen located between the receiving end of said overflow-pipe and said pipe or conduit.

6. The combination with a grain-bin provided with a discharge-spout and a steeping-tank, of a pipe or conduit provided at its receiving end with an enlarged receiving-chamber into which the bin-spout discharges, said conduit discharging into said steeping-tank, a water-pipe entering said receiving-chamber and discharging centrally of said chamber below the level of the discharge end of said bin-spout, said pipe or conduit being inclined downwardly from its receiving to its discharge end, whereby the grain and water are conveyed to the tank by gravity, and the receiving-chamber being obliquely disposed at a downward inclination toward the tank greater than that of said pipe or conduit.

709,559. FILE FOR PAPERS AND DOCUMENTS. GEORG H. SCHNEIDER, Nuremberg, Germany. Filed Apr. 19, 1902. Serial No. 103,760. (No model.)



Claim.—In a file for papers and documents, the combination with a suitable back, of flexible metal bands adapted to be bent up to a perpendicular from said back, to pass through and receive the papers, and then to be bent down flatwise thereon; tubular extensions at the free ends of said bands, and a bar having perpendicular receiving-pins adapted to be inserted in said extensions when the flexible bands are bent up to their receiving position, whereby such of the papers as overlie the one desired may be temporarily removed and afterward restored.

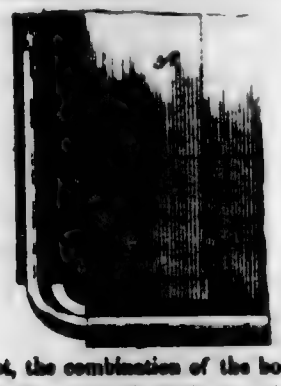
709,560. BUGGY-BOOT. JAMES W. SIMMONS, Bloomington, Ind. Filed Apr. 3, 1902. Serial No. 101,201. (No model.)

Claim.—1. In a buggy-boot, the combination of the boot proper formed of thin board material, and an edge binding on said board formed of endwise-overlapping sheet-metal sections of general U shape in cross-section and provided with tubular beaded edges, substantially as described.

2. In a buggy-boot, the combination of the boot proper formed of thin board material, and an edge binding on said board formed of endwise-overlapping sheet-metal sections of general U shape in cross-section and provided with tubular beaded edges and shoulders on one side, substantially as described.

3. In a buggy-boot, the combination of the boot proper formed of thin board material, a binding on each of the lateral edges and the rear edge of the board formed of endwise-overlapping sheet-metal sections of

general U shape in cross-section and provided with tubular headed edges, and one or more angular reinforcing-rods extending in said heads and presenting rounded corners at the corners of the frame formed by said binding, substantially as described.



4. In a baggy-boot, the combination of the boot proper formed of thin board material, a binding on each of the lateral edges and the rear edge of the board formed of endwise-overlapping sheet-metal sections of general U shape in cross-section and provided with tubular headed edges and shoulders on one side, and an angular rod at each corner of the frame formed by the binding, having its legs extended into the tubular heads thereof and presenting rounded corners between the adjacent ends of the frame-sections, substantially as described.

5. In a baggy-boot, the combination with a metal-bound boot proper formed of thin board material, of a riser provided near its opposite ends with depending legs to fit against the inner sides of a baggy-box and adapted to be fastened thereto, substantially as and for the purpose set forth.

6. In a baggy-boot, the combination with a metal-bound boot proper formed of thin board material, of a riser formed of said material and provided with a sheet-metal binding on each lateral edge, and a flaring sheet-metal leg near each said edge of the riser fastened at its upper end under the binding and depending to fit against an inner side of a baggy-box and adapt it to be fastened thereto, substantially as and for the purpose set forth.

709,561. POUCH. JOHN A. SMITHLIER and ADAM F. ZAMBER, Los Angeles, Cal. Filed Oct. 17, 1901. Serial No. 79,044. (No model.)

Claim.—1. A pouch comprising a body and a neck extending from the body; a clasp composed of members pivoted together and surrounding the neck intermediate the ends of the neck; and resilient means for holding such members in position to clasp and close the neck.

2. The combination with a pouch furnished with a neck; of a clasp connected with the pouch independently of the neck and comprising four members pivotally connected together in pairs to form a frame surrounding the neck intermediate the ends thereof; and means for yieldingly holding the pairs extended to close the clasp.

3. In a pouch, a clasp comprising four members pivoted together in pairs, said pairs being pivotally connected together; means for yieldingly holding the pairs of members extended to close the clasp; and finger-shields pivotally connected with the joints between the pairs and provided with portions to intercept the members of the clasp to prevent the clasp from being opened too widely.

4. A pouch-clasp comprising hollow members pivoted together in pairs and said pairs being also pivoted together at their ends; and springs in the pairs respectively to hold said pairs extended to close the clasp.

5. In a pouch-clasp, the combination of two members pivoted together and constructed for attachment to a pouch; and a spring fastened to said members at the joint thereof and engaging said members to hold them normally extended to close the clasp.

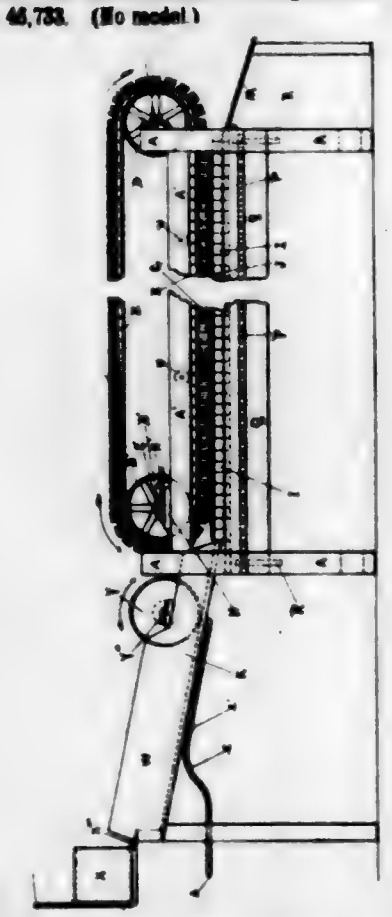
6. In a clasp, the combination of two trough-shaped members; a pivot connecting said members together; and a spring chambered in said members and connected with the pivot thereof and arranged to engage said members to hold them normally extended.

7. A pouch comprising a body; a neck extending therefrom; a clasp connected with the body and constructed to clasp the neck intermediate the ends of the neck; and four binding-strips fastened to the edges of the neck to stiffen the same and separated from each other at corners of the mouth of the neck to allow flexure.

8. A pouch comprising a body furnished with side extensions; a neck extending between said side extensions; a clasp fastened to the side extensions and constructed to clasp the neck; and springs contained in the clasp and arranged to hold the clasp in its clasping position.

9. A pouch comprising a body furnished with side extensions; a neck extending between said extensions; a clasp fastened to the extensions and constructed to clasp the neck; and four binding-strips fastened to the edges of the neck to stiffen the same outside the clasp.

709,562. MACHINE FOR BRUSHING AND CLEANING FRUIT, PART OF WHICH IS APPLICABLE TO FRUIT-GRADERS. MORTON G. SWAN and EARL H. RICHARDSON, North Ontario, Cal.; said Swan assignor to Frank James Kimball, Los Angeles, Cal. Filed Feb. 9, 1901. Serial No. 46,733. (No model.)



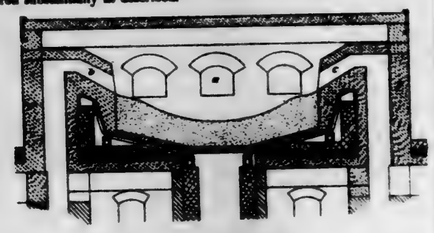
Claim.—1. In a fruit cleaning and brushing machine, the combination of means for feeding the fruit by gravity in regulated quantity, a horizontal traveling, endless brush-surfaced belt, a trough-shaped bed beneath said belt, said bed comprising stationary brushes, and means for adjusting the distances between said brushes; an elastic or yielding support for said brushes; and a slatted or other open frame below said support; the openings between the brushes and in the bed permitting the escape of the impurities detached from the fruit, substantially as hereinbefore described.

2. The combination with a fruit-cleaning machine of a hopper having an inclined bottom to feed the fruit to the machine by gravity, a feed-regulator in said hopper, comprehending a roller having a reduced central section, two relatively large end sections in close proximity to the hopper-bottom, said end sections being adjustable toward and from each other, means for adjusting said end sections and means for driving said roller in a direction opposite to the direction of feed, substantially as hereinbefore described.

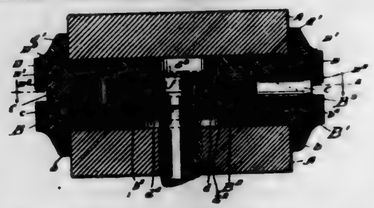
3. The combination with a fruit-cleaning machine of a hopper having an inclined bottom, a feed-regulator in said hopper, comprehending a transversely-arranged roller having two sections with an intervening space between the same, and adjustable toward and from each other, said sections being arranged in close proximity to the hopper-bottom, means for adjusting said roller-sections and means for rotating the same in a direction opposite to the direction of feed, substantially as hereinbefore described, and shown upon the annexed drawings.

709,568. PROCESS OF PRODUCING IRON. OTTO THIEL, Kaiserslautern, Germany. Filed Aug. 19, 1899. Serial No. 727,848. (No specimens.)

Claim.—In the manufacture of iron, heating a regenerative furnace by the introduction of heated reducing-gas, adding part of the flux to be employed and heating same, shutting off the gas-supply and adding the charge of ore, carbon and the remainder of the flux, readmitting the gas and then cutting it off to allow of an equalization of the temperature of the apparatus, then readmitting the gas until the desired degree of reduction is obtained and afterward adding molten iron to take up the reduced iron substantially as described.



709,564. PIVOTED ROCKER-BEARING CENTER-PLATE FOR RAILWAY-CARS. CHARLES M. THOMPSON, Newark, Ohio. Filed May 12, 1902. Serial No. 106,861. (No model.)



Claim.—1. In a railway car or vehicle, the combination with the truck and body bolster of a lower center-plate secured to the truck-bolster and provided with an annular track or channel for rockers, a body center-plate furnished with an annular track or bearing for rockers, a series of interposed radially-arranged rockers each having concentric upper and lower curved bearing-surfaces of different radii and provided with recesses in their ends at their lower portions, said lower or truck center-plate having a series of radial lugs or projections fitting in the recesses of the rockers to insure the rocking movement of the rockers and maintain their radial positions, substantially as specified.

2. In a railway car or vehicle, the combination with the truck or body bolster of a lower center-plate secured to the truck-bolster and provided with an annular track or channel for rockers, a body center-plate furnished with an annular track or bearing for rockers, a series of interposed radially-arranged rockers each having concentric upper and lower curved bearing-surfaces of different radii and provided with recesses in their ends at their lower portions, said lower or truck center-plate having a series of radial lugs or projections fitting in the recesses of the rockers to insure the rocking movement of the rockers and maintain their radial positions, said upper center-plate having a projecting central pivot or hub portion fitting in a central opening or bearing in the lower center-plate and pivotally connecting the center-plates together, substantially as specified.

3. The combination with a lower or truck center-plate having inner and outer flanges and an annular track or bearing for rockers between said flanges and a central pivot opening or bearing, of an upper or body center-plate having an annular track or bearing for rockers, an outer flange embracing the outer ends of the rockers and a central pivot or hub portion fitting in the central opening of the lower center-plate and a series of radially-arranged rockers interposed between the upper and lower center-plates and having upper and lower concentric bearing-surfaces of different radii, substantially as specified.

4. The combination with a lower or truck center-plate B having flanges b to embrace the truck-bolster and provided with an annular track B' for rockers, inner flange B^2, outer flange B^3, a central opening b^3, of upper or body center-plate D having flanges d' embracing the body-bolster, an annular track or bearing D' for the rockers, outer flange D^2, central hub portion d furnished with tapered end d^3 and radially-disposed rockers C having upper and lower concentric curved bearing-surfaces C' C^2 and recesses c in their ends, said lower center-plate B having a series of lugs or projections d^4, substantially as specified.

5. The combination of a lower center-plate provided with an annular track or channel for rockers, of an upper center-plate furnished with an annular track or bearing for rockers, a series of interposed radially-arranged rockers having concentric upper and lower bearing-surfaces of different radii and connections for causing the rockers to rock as the center-plates turn in respect to each other, substantially as specified.

6. The combination of a lower center-plate provided with an annular track or channel for rockers, of an upper center-plate furnished with an annular track or bearing for rockers, a series of interposed radially-arranged rockers having concentric upper and lower bearing-surfaces of different radii and connections for causing the rockers to rock as the center-plates turn in respect to each other, one of said center-plates having a central opening or bearing and the other a central pivot or hub portion fitting in said central opening, substantially as specified.

7. The combination with a pair of center-plates each having an annular track or bearing for rockers and one provided with a central opening or bearing and the other with a central pivot or hub fitting therein and a series of concentric rockers interposed between said center-plates and a series of interengaging lugs and recesses on the rockers and one of said center-plates to cause the rockers to rock and retain them in position as the center-plates turn in respect to each other, substantially as specified.

709,565. CORSET-STIFFENER. HEINRICH TOELKY, Ober-Kaufungen, near Cassel, Germany, assignor to Bertha Schenck, Ober-Kaufungen, near Cassel, Germany. Filed May 25, 1901. Serial No. 61,891. (No model.)

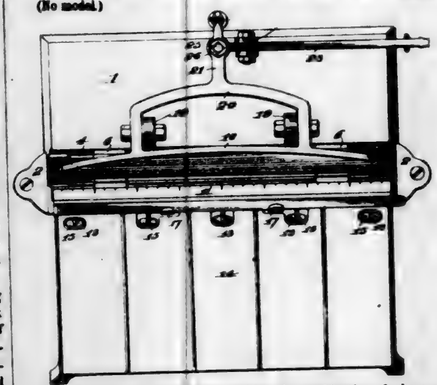
Claim.—1. A spring for corset-stiffeners and other purposes consisting of a series of parallel spiral spring-wires a wound to leave one edge of the spring undulating and open while the other is straight or closed, and a binding wire or wires passed through the loops of said coils on the open or undulating side, the whole being flattened substantially as set forth.

2. A flat corset-stiffener consisting of a series of parallel spiral spring-wires presenting a closed straight edge and an open undulating edge and a binding-wire forming loops which interlock with the loops of the said coils at the open or undulating edge of the spring substantially as set forth.

3. A flat corset-stiffener consisting of a series of parallel spiral spring-wires presenting a closed straight edge and an open undulating edge and a pair of binding-wires forming loops which interlock with the loops of the said coils substantially as set forth

4. A flat corset-stiffener consisting of a series of parallel spiral spring-wires presenting a closed straight edge and an open undulating edge and a pair of binding-wires crossing each other and forming loops which interlock alternately with the loops of the said coils substantially as set forth.

709,566. PERFORATING-MACHINE. EMORY A. TRUSSELL, St. Louis, Mo., assignor to Sieber & Trussell Manufacturing Company, St. Louis, Mo., a Corporation. Filed Nov. 21, 1901. Serial No. 83,103. (No model.)

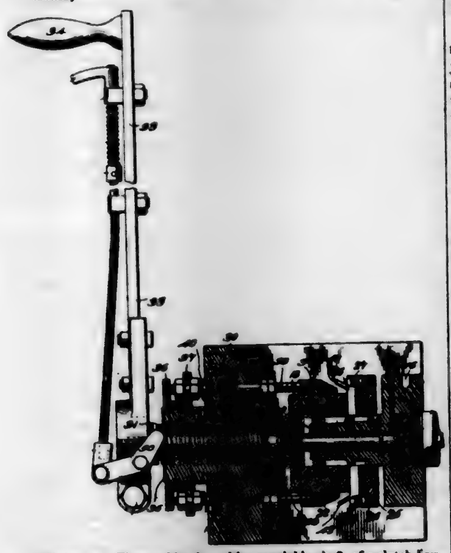


Claim.—1. In a perforating-machine, the combination of a base, removable punch-holders seated in said base, punches in said holders, a pivotally-supported pressure-head surmounting said punch-holders and adapted to operate said punches, a lever by which said pressure-head is carried, a spring arranged to hold said pressure-head in elevated position, an operating-lever, and an adjustment bearing-screw mounted in said pressure-head lever and adapted to receive said operating-lever, substantially as described.

2. In a perforating-machine, the combination of a grooved base, removable punch holders seated in the groove in said base, punches in said holders, a pressure-head, means for operating said pressure-head, a clamp-bar arranged to hold said punch-holders, binding-screws mounted in said base and adapted to bear against said clamp-bar to hold it to said punch-holders, and a table removably held to said base by the heads of said set-screws, substantially as described.

3. In a perforating-machine, the combination of a grooved base, removable punch-holders seated in the groove in said base, punches in said holders, a pressure-head, means for operating said pressure-head, a clamp-bar arranged to hold said punch-holders, binding-screws mounted in said base and adapted to bear against said clamp-bar to hold it to said punch-holders, and a gage slidingly mounted on said base, substantially as described.

709,567. CLUTCH-OPERATING MECHANISM. EDWARD TURNEY, Portland, Oreg. Filed Nov. 28, 1901. Serial No. 83,615. (No model.)



Claim.—1. The combination with a revolvable shaft, of a clutch having a movable member, a clutch-operating mechanism comprising an endwise-movable clutch-operating member carried by the shaft and operatively connected to the movable member of the clutch, a member affixed to and rotating with the shaft, a movable collar, means for moving the collar, mechanism for transmitting the movement of the collar to the clutch-operating member and means for locking the collar to the shaft member.

2. A clutch-operating mechanism comprising in combination, a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the shaft, a movable collar carried by the nut, a pin carried by the collar for engagement with the clutch-operating member, and mechanism for locking and unlocking the nut and collar, substantially as specified.

3. A clutch-operating mechanism comprising in combination, a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the end of the shaft, a collar mounted on the nut and adapted to be locked thereto, a pin carried by the collar for engagement with the clutch-operating member, and a thrust-screw adapted to engage with the collar-pin, substantially as specified.

4. A clutch-operating mechanism comprising in combination, a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a thrust-screw, mechanism for transmitting the movement of the screw to said clutch-operating member, and mechanism for locking said member in clutch-engaging position, said locking mechanism being independent of the screw, substantially as specified.

5. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the end of the shaft and having a locking-groove, a collar carried by and movable on said nut, locking-pins carried by the collar for engagement in said groove, a pin carried by the collar and adapted for engagement with the clutch-operating member, mechanism for imparting longitudinal movement to said pin, and means for unlocking the nut and collar.

6. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the end of the shaft and provided with an annular groove, a collar carried by the nut, radial pins adapted to guiding-openings in the collar, springs normally tending to move the pins into locking engagement in the groove, a pin adjustably secured to the collar and adapted to engage the clutch-operating member, means for effecting a longitudinal movement of said pins, and means for withdrawing the locking-pins from said annular groove, substantially as specified.

7. The combination of a revolvable shaft, a clutch having a movable member, a nut carried by the shaft and having an annular groove, adjustable nuts carried by said shaft-nut, a collar carried by said nut and adapted to be locked thereto, stops carried by the collar for engagement with said adjustable nuts, thereby to limit the longitudinal movement of the collar, an adjustable pin carried by said collar for engagement with the clutch-operating member, means for operatively connecting the clutch-operating member to the movable member of the clutch and means for effecting the longitudinal movement of said pin and collar, substantially as specified.

8. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the shaft and having a locking-groove, a collar mounted on said nut, a pin carried by the collar for engagement with the clutch-operating member, a series of locking-pins carried by the collar and adapted to engage in the groove of the nut, each of said pins having a projected finger, and a movable collar or ring having an inclined face for engagement with said fingers, and means for moving said collar and ring, substantially as specified.

9. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut having an annular locking-groove, a collar mounted on the nut, a series of locking-pins carried by said collar and adapted to enter said locking-groove, each of said pins being provided with a laterally-projected finger, a ring or collar having an inclined edge or face for engagement with said finger, means for moving said ring or collar into and out of engagement with the fingers, springs adapted to force the locking-pins into engagement with the locking-groove, an adjustable pin carried by the said collar for engagement with the clutch-operating member, and means for moving said pin and collar, substantially as specified.

10. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the end of the shaft, and having a guiding-opening in alinement with said clutch-operating member, a pin adapted to said opening and to engage the clutch-operating member, means for imparting endwise movement to said pin, and means for effecting the locking of said pin to said nut.

11. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the end of the shaft and having a guiding-opening in alinement with the clutch-operating member, a pin adapted to said opening and to engage the clutch-operating member, a thrust-screw for imparting endwise movement to the pin, and means independent of the thrust-screw for locking said pin in clutch-engaging position.

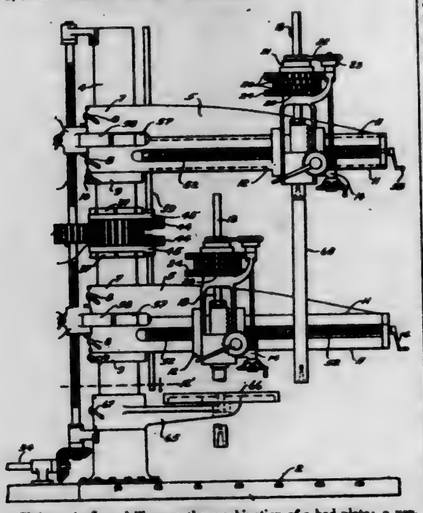
12. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the end of the shaft and having a guiding-opening in alinement with the clutch-operating member, a collar mounted on the shaft, means for locking and unlocking said collar and nut, a threaded pin carried by the collar and adjustable therein, a locked nut for securing the pin in adjusted position, said pin being adapted to enter the guiding-

opening of the nut and to engage the clutch-operating member, and a thrust-screw for imparting endwise movement to said pin, substantially as specified.

13. The combination of a revolvable shaft, a clutch having a movable member, a longitudinally-movable clutch-operating member carried by said shaft and operably connected to the movable member of the clutch, a nut secured to the shaft and having an annular groove, a collar mounted on the nut, pins carried by said collar for engagement in the groove, each of said pins having a laterally-projected finger, a pin carried by the collar for engagement with the clutch-operating member, a thrust screw, a stationary nut in which said thrust-screw is mounted, an operating-lever secured to said thrust-screw, a ring mounted on a boss forming part of said stationary nut, a ring or collar for engagement with the fingers of the locking-pins, and cams carried by said levers and movable into engagement with the ring carried by the nut, substantially as specified.

14. In a clutch-operating mechanism of the character described, the combination of the shaft, a clutch having a movable member, a nut carried by said shaft, a collar mounted on the nut, locking-pins carried by said collar, a ring mounted on said collar and adapted to engage with and unlock said pins, a stationary nut having a central boss, rings mounted on said boss and connected to the pin-engaging rings, a thrust-screw mounted in the stationary nut, mechanism for transmitting the endwise movement of the screw to the clutch-operating mechanism, and to the movable member of the clutch, an operating-lever secured to the screw, cam-levers pivoted to said operating-lever and adapted to engage the ring carried by the boss, and a handled rod connected to said levers, substantially as specified.

709,568. **DRILL-PRESS.** ADOLPH VIE, Chicago, Ill. Filed Apr. 2, 1902. Serial No. 101,847. (No model.)



Claim.—1. In a drill-press, the combination of a bed-plate; a vertical post rigidly secured to said bed-plate; a pair of arms independently journaled on said post and independently slidable longitudinally of same; drilling mechanism mounted on each of said arms; and means for operating said drilling mechanism independently of each other and of the relative angular or longitudinal position of said arms.

2. In a drill-press, the combination of a bed-plate; a vertical post rigidly secured to said bed-plate; a pair of arms independently journaled on said post and independently slidable longitudinally of same; drilling mechanism mounted on each of said arms; a screw-threaded shaft journaled in said frame in parallel relation to said post; each of said arms having secured to same a suitable clamp, adapted to be thrown into or out of engagement with the thread on said shaft and adapted when in engagement with said thread, to move said arm longitudinally of said post, through the revolution of said shaft; suitable means for securing said arms against movement longitudinally of said post; and means for operating said drilling mechanism independently of each other or of the relative angular or longitudinal position of said arms.

3. In a drill-press, the combination of a bed-plate; a vertical post rigidly secured to said bed-plate; a pair of arms independently journaled on said post and independently slidable longitudinally of same; drilling mechanism mounted on each of said arms; a gear journaled on said post between said arms; a driven shaft journaled on each of said arms and in parallel relation to said post; a pinion secured to each of said driven shafts and meshing with said gear; suitable mechanism connecting each of said driven shafts to the drilling mechanism on its respective arm; and means for transmitting power to said gear.

4. A drill-press comprising a frame; a vertical post rigidly secured to said frame; an arm journaled on said post and slidable longitudinally of same; drilling mechanism mounted on said arm; a screw-threaded shaft journaled in said frame and disposed in parallel relation with said post; means for rotating said shaft; suitable gearing connecting said shaft with said drilling mechanism whereby said drilling mechanism may be driven by said shaft regardless of the position of said arm along said post; a clutch for disconnecting said shaft from said drilling mechanism; a suitable clamp secured to said arm and adapted to be thrown into or out of engagement with the thread on said shaft, and adapted, when in engagement with said thread, to move said arm longitudinally of said post, through the revolution of said shaft; and suitable means for securing said arm against movement longitudinally of said post.

5. A drill-press comprising a frame; a vertical post rigidly secured to said frame; an arm journaled on said post and slidable longitudinally of same; a screw-threaded shaft journaled in said frame and disposed in parallel relation with said post; means for rotating said shaft; a suitable clamp secured to said arm, adapted to be thrown into and out of engagement with the thread on said shaft, and adapted, when in engagement with said thread, to move said arm longitudinally of said post, through the revolution of said shaft; suitable means for securing said arm longitudinally of said post; a gear secured to said threaded shaft; a gear journaled on said post and meshing with the gear on said shaft; a driven shaft, journaled to said arm on a vertical axis, having mounted thereon and revolvable therewith a pinion meshing with the gear on said post, said pinion being secured against movement longitudinally of said post; drilling mechanism mounted on said arm; and suitable gearing connecting said drilling mechanism with said driven shaft.

6. A drill-press comprising a frame; a vertical post rigidly secured to said frame; an arm journaled on said post and slidable longitudinally of same; drilling mechanism mounted on said arm; a screw-threaded shaft journaled in said frame and disposed in parallel relation with said post; means for rotating said shaft; suitable gearing connecting said shaft with said drilling mechanism whereby said drilling mechanism may be driven by said shaft regardless of the position of said arm along said post; a clutch for disconnecting said shaft from said drilling mechanism; a member slidably mounted on said post and adapted to engage said arm; a suitable clamp secured to said member and adapted to be thrown into or out of engagement with the thread on said shaft and adapted, when in engagement with said thread, to move said member and cause same to carry said arm longitudinally of said post; and means for securing said arm independently of said member.

7. In a drill press, the combination of a bed-plate; a vertical post rigidly secured to said bed-plate; a pair of arms independently journaled on said post and independently slidable longitudinally of same; drilling mechanism mounted on each of said arms; a gear journaled on said post between said arms; a driven shaft journaled on each of said arms and in parallel relation to said post; a pinion secured to each of said driven shafts and meshing with said gear; said pinions being of less width than said gear and being adapted to pass each other while in mesh with said gear; suitable mechanism connecting each of said driven shafts to the drilling mechanism on its respective arm; and means for transmitting power to said gear.

8. In a drill-press, the combination of a frame; a vertical post secured to said frame; a screw-threaded shaft journaled in said frame in parallel relation to said post; an arm having a hub journaled on said post and slidable longitudinally of same, said hub having therein an annular groove extending around said post; a segment loosely seated in said groove; a pair of screw-threaded clamp-jaws secured to said segment, adapted to be thrown into or out of engagement with said shaft and adapted to move said arm along said post through the revolution of said shaft.

709,569. **FLASK.** EDMUND WEIDENBAUER, Chicago, Ill. Filed Feb. 3, 1902. Serial No. 92,266. (No model.)

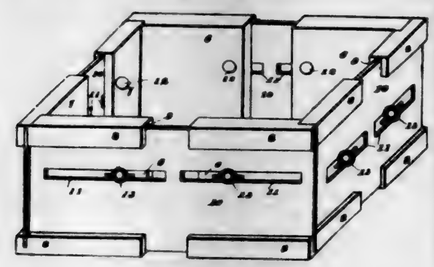
Claim.—1. A flask having divided side portions and independent adjustable extension-pieces connecting each portion.

2. A flask having sides and ends each divided into separable portions, and adjustable extension-pieces connecting each portion.

3. A flask having sides and ends each divided into separable portions, flanges on said portions forming retaining-channels, and extension-pieces connecting said portions and slidable in the channels.

4. A flask having sides and ends divided into separable portions the inner faces of which are flush with each other, slotted adjustable exten-

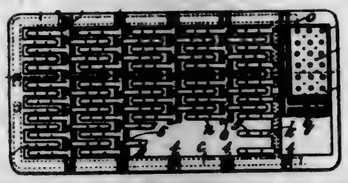
sion-pieces connecting said portions, bolts fixed to the portions and extending through the slots, and nuts on the bolts to bind the parts at the desired adjustment, substantially as described.



709,570. **PROCESS OF PRODUCING CYANATE OF POTASSIUM.** SYLVESTER BOCKEWERDT, Leopoldshall, Germany. Filed June 4, 1900. Serial No. 19,029. (No specimens.)

Claim.—The process herein described for the separation of cyanate of potassium from cyanid and carbonate, thereby producing pure cyanate of potassium, which consists in first treating the salt mixture obtained from the synthetic cyanogen processes, with sufficient water to dissolve the carbonate and at a temperature not over 66° centigrade, whereby the cyanid and cyanate remain undissolved, and then treating the said remaining undissolved salt mixture with sufficient water to dissolve the cyanid and at a temperature not exceeding 5° centigrade, whereby the cyanate remains undissolved.

709,571. **PERFECT-COMBUSTION FURNACE.** WILLIAM H. BUNT, Los Angeles, Cal., assignor of two-thirds to John H. Bunt and Bura Bunt, Quincy, Ill. Filed May 27, 1901. Serial No. 62,168. (No model.)



Claim.—1. In a furnace, the combination of a hollow grate-frame with bearings therein and air-outlets opening from the chamber of the grate-frame into said bearings; and hollow perforated grates furnished with journals which turn in said bearings and having perforations in the journals to register with the perforations in the bearings; means for supplying compressed air to the hollow grate-frame to supply said grates with air; and means for partially rotating the grates on their journals.

2. A furnace comprising a hollow grate-frame furnished with bearings and holes leading from the hollow chamber to the bearings; hollow perforated removable shaker-grates having journals which turn in said bearings and furnished at their ends respectively with holes to register with the holes in said bearings, said holes leading into the hollow chambers of the grates, respectively, to furnish air to the hollow grates.

3. A furnace comprising a support furnished with an air-passage; grates pivoted in said support and respectively furnished with a main air-trunk and with fingers; said trunk and fingers being hollow and perforated to conduct air from said main trunk into the furnace; a drop-grate furnished with perforations therethrough and pivoted in the support and also furnished with air-passages and with outlets opening from said air-passages; means for shaking the grates; and means for operating the drop-grate.

4. In a furnace, a grate-support furnished on its opposite sides, respectively, with independent air-passages and with journal-bearings; openings being provided in said bearings to communicate with the air-passages of their sides respectively; hollow grates mounted in the bearings and furnished with openings to register with the openings of the bearings, respectively, said grates being perforated to form outlets for the air.

709,572. **HOISTING-HOOK.** SAMUEL OGWAN, Jardine, Mont. Filed Mar. 27, 1902. Serial No. 100,202. (No model.)

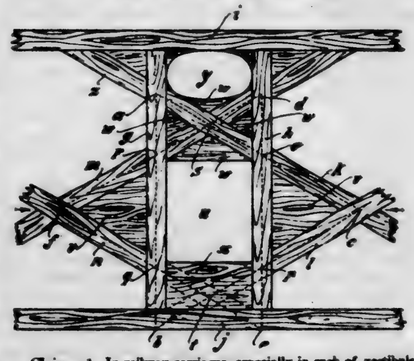
Claim.—1. In a hoisting-hook, the combination with a housing, of a hook proper, a slidable section forming a continuation of the hook proper teeth on said section, a shaft, teeth on the shaft, a locking-flange coöperating with said shaft, and a spring adapted to hold the aforesaid flange in engagement with notches upon a boss located on the housing, substantially as set forth.

2. In a hoisting-hook, the combination with a housing, of a slidable hook-section having teeth, a segment engaging said teeth, the width of said segmental teeth being less than that of the teeth of the hook-section, a flange by which the segment may be turned, means for locking said flange, and a spring to hold the flange in a locked position, substantially as described.

3. In a hoisting-hook, the combination with a housing, of a slidable hook-section having teeth, a shaft, a segment on the shaft engaging said teeth, a flange on the shaft, notches being formed with which the flange engages, and a spring to normally hold the flange in contact with the notches, substantially as set forth.

4. In a hoisting-hook, the combination with a housing, of a movable hook-section having teeth, a shaft, a segment on said shaft, a flange on said shaft, a hollow boss projecting from the housing having two sets of notches, and a spring for forcing the flange on the shaft into either designated set of notches, substantially as described.

709,573. **SAFETY-OUTLET IN LONGITUDINAL WALLS OF RAILWAY-CARRIAGES.** DEUTSCH EISENBAHNBAU, Ottweiler, Germany. Filed May 20, 1902. Serial No. 108,183. (No model.)



Claim.—1. In railway-carriages, especially in such of vestibule or corridor trains, the arrangement of strengthened parts in the longitudinal walls, each consisting of two congruent equicrural beam-triangles *a b c* and *d e f*, being laid upon each other in such a manner, that their vertices point outward in opposite directions along the carriage and their bases run parallelly, and being immovably connected with each other and with the longitudinal beams or frame-irons *i*, *j* of the carriage, the base-beams *g*, *h* of the two triangles forming traverses between the latter, and the safety-exits consisting of suitable closed openings *n* lying between the parallel base-beams *g*, *h* and the lower adjoined parties of the triangle side beams *k*, *l* and *m*, *o* crossing each other.

2. In railway-carriages, especially in such of vestibule or corridor trains, provided with strengthened parts in the longitudinal walls, each

containing a safety-exit, the strengthened wall parts each consisting of two congruent equicrural beam-triangles *a b c* and *d e f*, being laid upon each other in such a manner, that their vertices point outward in opposite directions along the carriage and their bases run parallelly, and being immovably connected with each other and with the longitudinal beams or frame-irons *i*, *j* of the carriage, the base-beams *g*, *h* of the two triangles forming traverses between the latter, and the safety-exits consisting of suitable closed openings *u* lying between the parallel base-beams *g*, *h* and the lower adjoined parties of the triangle side beams *k*, *l* and *m* *n* crossing each other a special arrangement of the strengthened parts with safety-exits in the opposite walls, these parts and exits being arranged alternately in the one and in the opposite wall of the carriage.

3. In railway-carriages, especially in such of vestibule or corridor trains, provided with strengthened parts in the longitudinal walls, each containing a safety-exit, the strengthened wall parts each consisting of two congruent equicrural beam-triangles *a b c* and *d e f*, being laid upon each other in such a manner, that their vertices point outward in opposite directions along the carriage and their bases run parallelly, and being immovably connected with each other and with the longitudinal beams or frame-irons *i*, *j* of the carriage, the base-beams *g*, *h* of the two triangles forming traverses between the latter, and the safety-exits consisting of suitable closed openings *u* lying between the parallel base-beams *g*, *h* and the lower adjoined parts of the triangle side beams *k l* and *m*, *n* crossing each other, the arrangement of the strengthened parts with safety-exits not only in the two side walls, but also in the floor and in the roof of the carriage.

709,574. EYEGLASSES. ROBERT B. FISH, Denver, Colo., assignor of one-half to Edwin T. Jones, Denver, Colo. Filed Mar. 19, 1901. Serial No. 51,954. (No model.)

Claim.—1. In eyeglasses the combination with the bridge and lens-holder, of a post connected with the lens-holder by means of a lug, a guard provided with separated, apertured ears which engage the post, and a spring coiled around the post and bearing against the lug at one extremity and the ear of the guard at the other extremity, the opposite ear engaging the lug on the opposite side from the spring, whereby the guard is locked against movement in the direction of the spring's action.

2. In eyeglasses the combination with a bridge and the lens-holder of a post connected with the lens-holder, a guard having two separated, apertured ears through which the post passes, a spring coiled around the post on one side of its connection with the lens-holder, means for forming a stop for the spring in one direction, the other extremity of the spring engaging an ear of the guard and having a tendency to push it off the post, and means engaging the opposite ear of the guard to prevent the guard-ear acted on by the spring, from being disengaged from the post by the spring, the arrangement being such that by pressing one ear against the spring, the other ear may be disengaged from the post, and the guard readily detached.

3. In eyeglasses the combination with the bridge and lens-holder, of a post mounted on the lens-holder, a guard provided with separated, apertured ears through which the extremities of the post pass, a spring coiled around the post, a stop on the post engaging the spring at one extremity, the other extremity of the spring bearing against an ear of the guard, and having a tendency to push it off the post, and a stop connected with the post and engaging the other ear of the guard and arranged to hold the guard in place on the post in opposition to the tendency of the spring.

4. In eyeglasses the combination with a bridge and a lens-holder, of a post made fast to the lens-holder, a guard provided with separated apertured ears, said ears being in sliding engagement with the post, a spring coiled around the post, a stop connected with the post and engaging one extremity of the coil, the other extremity of the coil bearing against one ear of the guard, and a stop connected with the post and engaged by the other ear of the guard, the arrangement being such that the expansion of the spring holds the guard in place on the post, while its torsional force is exerted to throw the guard toward the bridge whereby it grasps the nose of the wearer.

5. In eyeglasses the combination with a bridge and lens-holder, of a post mounted on the lens-holder, a guard provided with two separated, apertured parts forming bearings for the post and slidable thereon, a spring coiled around the post, a stop for one extremity of the coil whose opposite extremity engages a bearing of the guard, and a stop against which the opposite bearing of the guard is held by the action of the spring.

6. In eyeglasses the combination with a bridge and lens-holder, of a post mounted on the lens-holder, a guard having separated, apertured parts forming bearings which are slidable on the post, a spring coiled around the post between the guard-bearings, one extremity of which engages the lens-holder, while the other extremity bears against the guard, a stop for one extremity of the coil whose opposite extremity engages a bearing of the guard, and a stop against which the opposite bearing of the guard is held by the action of the spring.

7. In eyeglasses the combination with a bridge and lens-holder, of a post supported by the lens-holder, a guard having two separated, apertured parts forming bearings for the post and slidable thereon, a spring coiled around the post and engaging at one extremity, one of the bearing parts of the guard, a stop which the opposite extremity of the spring engages, and a stop against which the other bearing of the guard is held by the spring, the arrangement being such that as pressure is applied to the bearing engaged by the spring, the other bearing may be slipped from the post.

8. In eyeglasses the combination with a bridge and lens-holder, of a post mounted on the bridge, a guard mounted on the post and having two separated arms terminating in nosepieces, said arms being spring-pressed toward the bridge, the guard having two separated bearings engaging the post, a spring coiled around the post and having one extremity engaging one bearing of the guard, a stop against which the opposite extremity of the spring bears, and a stop against which the other bearing of the guard is held by the expansive action of the spring, the arrangement being such that if pressure is applied to the bearing engaged by the spring, the other bearing may be detached from the post.

9. In eyeglasses the combination with a bridge and a lens-holder, of a post mounted on the lens-holder, a guard provided with two separated apertured parts forming bearings for the post and slidable thereon, a spring coiled around the post, a stop on the frame preventing longitudinal movement of the spring, said spring engaging a bearing of the guard, and a stop against which the opposite bearing of the guard is held by the action of the spring, substantially as described.

10. In combination with a pair of lenses and a bridge, a pair of upright pivots one at each end of the bridge, a nose-guard journaled on each pivot and consisting of a handle portion lying in front of the bridge and adjacent lens and a pair of arms extending inwardly and spread apart to straddle the bridge and provided with bearing-tips at their extremities, and springs pressing the tip-carrying ends of the arms toward each other.

11. The combination with a pair of lenses and a bridge, of a pair of upright pivots mounted on the bridge, a nose-guard journaled on each pivot and consisting of a handle portion lying in front of the bridge and a pair of arms extending inwardly and spread apart to straddle the bridge and provided with bearing-tips at their extremities, and springs pressing the tip-carrying ends of the arms toward each other.

12. The combination with a pair of lenses and a bridge, of a pair of nose-guards pivotally mounted on the bridge, each nose-guard consisting of a handle portion lying in front of the bridge, and a pair of arms extending inwardly and spread apart to straddle the bridge, said arms being provided with bearing-tips at their extremities, and springs pressing the tip-carrying ends of the arms toward each other.

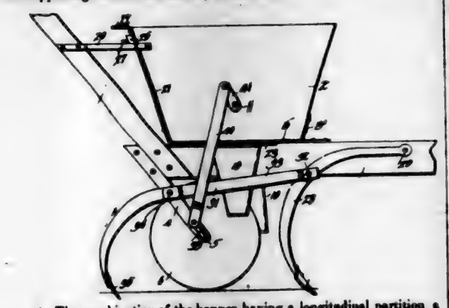
13. The combination with a pair of lenses and a bridge, of a nose-guard pivotally mounted at each end of the bridge and consisting of a handle portion lying in front of the bridge, and a pair of arms extending inwardly and spread apart to straddle the bridge, said arms being provided with bearing-tips at their extremities, and springs pressing the tip-carrying ends of the arms toward each other.

709,575. COMBINED SEED-PLANTER AND FERTILIZER-DISTRIBUTER. EDWARD G. HENRY, Powellville, Ga., assignor of one-half to Benjamin J. Merrill, Carrollton, Ga. Filed May 28, 1902. Serial No. 108,562. (No model.)

Claim.—1. The combination of the beam, the hopper supported thereon near the rear end and having seed-tubes disposed one on each side of the beam, the standard connected with the latter in front of the hopper, the brackets secured to and extending downwardly and rearwardly from the rear end of the beam carrying the supporting-wheel, and beams having rigid connection with said brackets and with the front standard, said beams being formed with outwardly-disposed yokes forming guards for the seed-tubes and intermediate parts, substantially as set forth.

2. The herein-described frame comprising the bifurcated front standard, the brackets adapted for attachment to the rear end of the beam and the beams connecting said bifurcated standard with the said brackets and extended downwardly and rearwardly from the latter, said beams being provided with outwardly-disposed yokes located intermediately between the front standard and the rear brackets, substantially as set forth.

3. In a device of the class described, the combination of the beam having downwardly and forwardly extending brackets carrying the supporting-wheel, the front standard having bifurcated upper end rigidly connected with the beam and carrying a furrow-opener, the rear standards carrying covering-shovels and having beams rigidly connected with the brackets and with the front standard and having outwardly-disposed yokes intermediately between their points of attachment, the hopper mounted upon the beam and having downwardly-extending seed-tubes disposed inside of said yokes, a partition in said hopper, means for agitating the contents of the hopper-compartments, and operating means driven from the supporting-wheel, substantially as set forth.



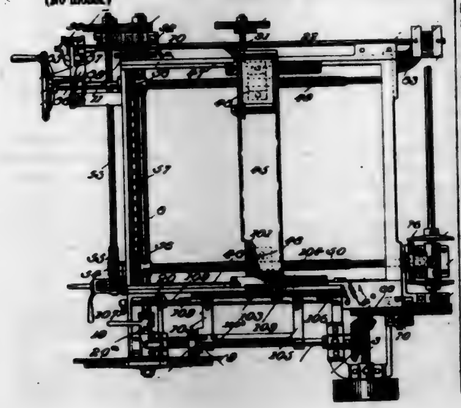
4. The combination of the hopper having a longitudinal partition, a bottom for said hopper having a central slot or opening, a plate secured longitudinally across said slot or opening which is thereby divided into two separate slots, and seed-tubes connected with and depending from the edges of said central dividing-plate, substantially as set forth.

5. The combination of the hopper, the bottom plate having a central slot or opening, a dividing-plate secured longitudinally across said slot or opening and having depending flanges forming the inner walls of the seed-tubes, and wings extending from said flanges and bent to form the front, rear and outer walls of the seed-tubes, substantially as set forth.

6. The combination of the hopper, the bottom plate for the same having a central opening, a dividing-plate secured longitudinally across said opening, the seed-tubes depending from said plate, the beam arranged between said seed-tube and supporting the hopper, the front standard carrying an opening-shovel, the rear standards carrying the covering-shovels, and beams extending forwardly from said rear standards and having connection with the front standard and with the supporting-brackets, said beams being formed with yokes disposed outside of and serving to guard the seed-tubes and intermediate parts, substantially as set forth.

7. The combination of the hopper, the bottom plate for the same having a central opening, a dividing-plate secured longitudinally across said opening, the seed-tubes connected with and depending from the edges of said plate directly below the divisions of the central slot, a partition arranged longitudinally within the hopper, and levers mounted pivotally upon the rear side of the latter and having slides extending forward between the bottom plate of the hopper and the other ends of the seed-tubes, substantially as set forth.

709,576. MACHINE FOR PRODUCING WOOD FIBER. HORACE M. HOOVER, Perrysburg, Ohio. Filed June 26, 1901. Serial No. 66,141. (No model.)



Claim.—1. In a machine of the character described, a cutter-head, a carriage carrying head and tail stocks, a screw-shaft for advancing said carriage to and from said cutter-head, automatic means for operating said screw-shaft rapidly, and means for operating it relatively slower, substantially as described.

2. In a machine of the character described, a cutter-head, a carriage carrying head and tail stocks, a screw-shaft for advancing said carriage, a worm and worm-wheel near one end of said shaft for operating it, and means near the opposite end of said shaft for giving it a relatively high speed, substantially as described.

3. In a machine of the character described, a cutter-head, a carriage carrying head and tail stocks, a screw-shaft for advancing said carriage, a worm and worm-wheel near one end of said shaft, and friction-gearing near its other end, substantially as described.

4. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving it a comparatively slow movement when the work is being done, and automatic means for shifting it rapidly in each direction, substantially as described.

5. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving the carriage a comparatively slow motion, when the work is being done, automatic means for shifting it rapidly in each direction, and an automatic device for stopping it, substantially as described.

6. In a machine of the character described, a cutter-head, a carriage for supporting the work, a screw-shaft for advancing said carriage, a worm and worm-wheel for rotating said shaft, and means actuated by the carriage for separating said worm and worm-wheel, substantially as described.

7. In a machine of the character described, a carriage, a screw-shaft for moving it, a worm-wheel, a worm, a pivoted arm supporting said worm in mesh with said worm-wheel, and automatic means for releasing said pivoted arm and allowing the worm and its wheel to separate, substantially as described.

8. In a machine of the character described, a carriage, a screw-shaft for moving it, a worm-wheel on said shaft, a worm meshing therewith, a pivoted arm supporting said worm, an upright for holding said arm with the worm and its wheel in mesh, and means operated by the carriage for moving said upright and allowing the arm and worm to drop, substantially as described.

9. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving motion to the carriage, a rock-shaft controlling said means, and means for rocking said shaft as the carriage nears the end of its movement to stop the carriage, substantially as described.

10. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving motion to the carriage, a rock-shaft controlling said means, a quadrant, and a spring-actuated arm acting between said rock-shaft and quadrant, substantially as described.

11. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving motion to the carriage, a rock-shaft controlling said means, a quadrant, a spring-actuated arm acting between the rock-shaft and quadrant for manually rocking said shaft, and means for automatically rocking said shaft by the movement of the carriage, substantially as described.

12. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving motion to said carriage comprising a screw-shaft, friction-disk and shiftable friction-wheels, a shaft supporting said friction-wheels, a rock-shaft and means for rocking it, and gearing between said shafts whereby the rocking of the shaft shifts the friction-wheels and their shaft, substantially as described.

13. In a machine of the character described, a cutter-head, a carriage for supporting the work, means for giving the carriage movement comprising a screw-shaft, a longitudinally-movable shaft, and gearing between said shafts, a rock-shaft and means for rocking it, and a rack and segment between said rock-shaft and the longitudinally-moving shaft, whereby the rocking of the rock-shaft controls the said gearing, substantially as described.

14. In a machine of the character described, a head-stock spindle and its center, a wheel acting on the work, and mechanism driven by said spindle for positively rotating said wheel and thereby rotating the work independently of said center.

15. In a machine of the character described, a head-stock spindle, a wheel acting on the work and adapted to rotate the same, and intermediate gearing between the head-stock spindle and said wheel for giving it motion, substantially as described.

16. In a machine of the character described, a head-stock spindle, a wheel acting on the work and adapted to rotate the same, and a train of gears between the head-stock spindle and said wheel for rotating the latter, the said wheel being spring-actuated so as to follow any irregularities of the work, substantially as described.

17. In a machine of the character described, a head-stock spindle,

and a spring-actuated wheel driven from said spindle for acting against and rotating the work, substantially as described.

18. In a machine of the character described, a head-stock spindle, a spring-actuated wheel driven from said spindle for acting against and rotating the work, and means for holding said wheel away from the work, substantially as described.

19. In a machine of the character described, a head-stock spindle, a toothed wheel, a spring acting to press said toothed wheel into the work, and intermediate mechanism between the head-stock spindle and said wheel for driving the latter, substantially as described.

20. In a machine of the character described, a head-stock spindle, a toothed wheel acting to press against and rotate the work, a shaft carrying said wheel, a pivoted bearing-box for said shaft, and intermediate mechanism for driving said shaft and wheel, substantially as described.

21. In a machine of the character described, a frame, a carriage, changeable-speed gearing for giving the work rotary motion, a pinion operated from said carriage, a movable rack meshing with said pinion and arranged to be moved thereby, the movement of one of the elements of the changeable gearing being controlled by the movement of said rack, substantially as described.

22. In a machine of the character described, a frame, a carriage, changeable-speed gearing for giving the work rotary motion, a pinion operated from said carriage, a longitudinally-movable rack moved by said pinion, an arm projecting from said rack and controlling the movement of one of the elements of said changeable-speed gearing, whereby the rotary movement of said pinion moves the rack and changes the speed of the work, substantially as described.

23. In a machine of the character described, a frame, a carriage, changeable-speed gearing for giving the work rotary movement, a pinion operated from said carriage, a rack moved longitudinally by said pinion, the movement of one of the elements of said speed-gearing controlled by the longitudinal movement of the rack, and means for putting said rack and pinion in and out of gear, substantially as described.

24. In a machine of the character described, a cutter-head, a carriage carrying head and tail stocks, mechanism controlled both manually and automatically for giving rapid movement to said carriage in each direction and means for moving the carriage relatively slower, substantially as described.

25. In a machine of the character described, a cutter-head, a carriage carrying head and tail stocks, a screw-shaft for advancing said carriage to and from said cutter-head, manual and automatic means for operating said screw-shaft rapidly and means for operating it relatively slower, substantially as described.

26. In a machine of the class described, a head-stock spindle and its center, a wheel acting on the end of the work for feeding the same, and mechanism for positively rotating said wheel and thereby rotating the work independently of said center, substantially as described.

27. In a machine of the class described, a head-stock spindle, a wheel for feeding the work, and mechanism for positively rotating said wheel and thereby rotating the work; the said wheel being conical or tapering whereby it continues to feed the work as the latter is reduced in size, substantially as described.

709,577. DROP-HAMMER. LEONARD D. HOWARD, St. Johnsbury, Vt. Filed May 13, 1902. Serial No. 106,955. (No model.)

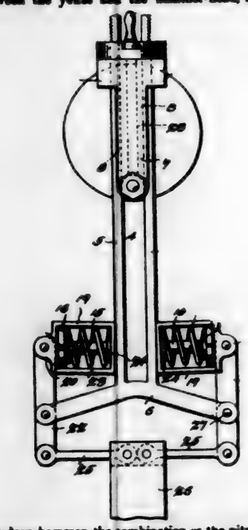
Claim.—1. In a drop-hammer, the combination with the pitman having vertical side members, of a casting mounted slidingly between said side members and having pivotal connection with the wrist-pin of the operating-disk, and means for supporting the pitman with relation to said casting, substantially as set forth.

2. In a drop-hammer, the combination with the pitman having vertical side members, of a casting mounted slidingly upon said side members and having pivotal connection with the wrist-pin of the operating-disk, and an adjusting-nut engaging threads upon the pitman members and having a seat or support upon the upper end of the casting, substantially as set forth.

3. In a drop-hammer, the combination with a pitman having vertical side members, of a casting mounted slidingly between said side members and having pivotal connection with the wrist-pin of the operating-disk, arms extending laterally from the upper part of said casting in front and in rear of the pitman members, and an adjusting-nut seated upon said arms and engaging threads in the upper ends of the pitman members, substantially as set forth.

4. In a drop-hammer, the combination of a pitman having vertical side members, with a casting mounted slidingly between said side members and having pivotal connection with the wrist-pin of the operating-disk, said casting being provided with an opening or core extending throughout its length, and means for supporting the pitman adjustably upon said casting, substantially as set forth.

5. In a drop-hammer, the combination of a pitman, a casting having means for pivotal connection with the wrist-pin of the operating-disk, said casting having sliding connection with the pitman, means for supporting the pitman upon the casting, a cross-arm at the lower end of the pitman, cylindrical projections above said cross-arm, yokes mounted upon said cylindrical projections, springs seated upon the latter within the yokes, adjusting-nuts upon the outer ends of said cylindrical projections, a hammer-head movable with respect to the pitman, and suitable connections between the yokes and the hammer-head, substantially as set forth.



6. In a drop-hammer, the combination of the pitman having a cross-arm at its lower end and provided with laterally-extending cylindrical projections or bolts above said cross-arm, the yokes mounted upon said bolts, springs mounted upon said bolts bearing upon the inner ends of the yokes, adjusting-nuts upon the outer ends of the bolts, a hammer-head movable with relation to the pitman and suitable connections between the said yokes and the hammer-head, substantially as set forth.

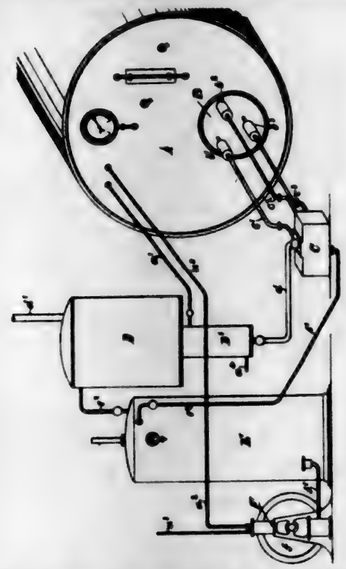
7. In a drop-hammer, the combination of the pitman having laterally-extending cylindrical projections or bolts, adjusting-nuts upon the outer ends of the latter, yokes mounted upon the said bolts and receiving the adjusting-nuts, springs mounted upon the said bolts between the adjusting-nuts and the inner ends of the yokes, a hammer-head movable in relation to the pitman and suitable link connections between the said yokes and the hammer-head, substantially as set forth.

709,578. COMBINED CURTAIN-FIXTURE AND CURTAIN-SUPPORT. CHARLES B. JACOBY, West Hazleton, Pa. Filed Apr. 9, 1902. Serial No. 102,113. (No model.)

Claim.—As a new article of manufacture a combined curtain-fixture and curtain-pole support formed from a single piece of sheet metal and comprising a base-plate having an opening to receive a fastening-screw and provided on opposite sides of said opening with V-shaped struck-up spurs to engage the window-casing, said plate being provided at one end with a curtain-roller bracket bent at right angles thereto and with an arm bent forwardly over and beyond said curtain-bracket to form a curtain-pole support, substantially as set forth.

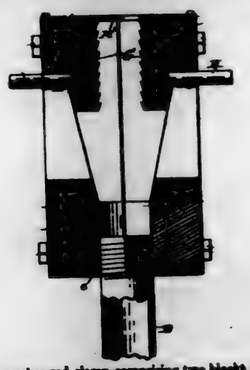
709,579. APPARATUS FOR SPRAYING AND BURNING LIQUID FUEL. ANDREW KIESLER, Hamburg, Germany. Filed May 23, 1900. Serial No. 17,094. (No model.)

Claim.—1. In an apparatus for spraying and burning liquid fuel, the combination with air and fuel reservoirs, and pipes leading therefrom, of a distributing-box having a pivotal connection with said pipes, tubes leading from the distributing-box, and burners carried at the opposite end of said tubes, each of said tubes being pivotally jointed intermediate its respective burner and the distributing-box, as and for the purpose specified.



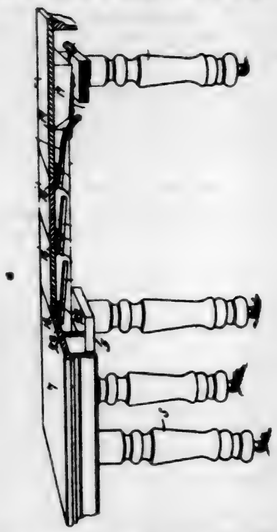
2. In an apparatus for spraying and burning liquid fuel, the combination with air and fuel reservoirs, and pipes leading therefrom, of a distributing-box arranged intermediate the outer ends of the said pipes and having a pivotal connection with said ends, tubes leading from the distributing-box at points to one side of the point at which said box is pivoted, and burners carried at the other end of the tubes, each of said tubes being pivotally jointed intermediate its respective burner and the distributing-box, as and for the purpose specified.

709,580. SUCKER-ROD GRAB FOR OIL-WELLS, &c. WARREN LA RUFFE, Cairo, W. Va. Filed May 20, 1902. Serial No. 108,532. (No model.)



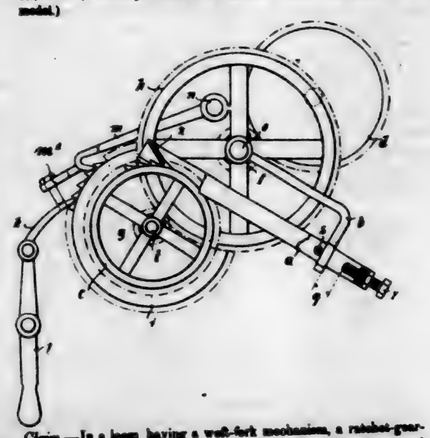
Claim.—A center-rod clamp comprising two blocks having mating semicylindrical grooves forming a cylindrical bore interiorly screw-threaded to be attached to the screw-threaded end of a well-tube, a wedge-shaped opening in each block above said semicylindrical groove having a groove in the vertical walls thereof at each side of the oblique surface, wedge clamps slidably mounted in said wedge-shaped opening and having flanges to fit into said grooves, a bolt entered in the oblique face of each clamp and extending through a vertical slot in the block, eyebolts entered in said blocks, a lever pivoted in said eyebolts formed to surround said blocks, slotted surfaces on each side of said lever to receive said bolts, and a plate secured to the tops of said blocks, substantially as shown and described.

709,581. TABLE-FASTENER. JOHN HEMMELLER, Janesville, Wis. Filed Feb. 24, 1902. Serial No. 95,227. (No model.)



Claim.—In an extension-table, the combination with the separable end members provided respectively with a catch-lip and with a suitably-operated catch-lever, of intermediate leaves adapted to be inserted between said end members, each of said leaves being provided on its under side with a catch-lip located near one of its edges, a bearing located near the edge opposite to that having said catch-lip, and a catch-lever mounted pivotally in said bearing, adapted to engage the lip of the adjacent leaf, and having its operating end extended nearly to the edge of the leaf supporting said lever which is provided with a catch-lip, whereby the operating end of said lever is rendered accessible without necessity of reaching under the leaf, substantially as set forth.

709,582. TAKE-UP MECHANISM FOR LOOMS. GOTTLOB SCHMIDT, Sr., Colmar, Germany. Filed Feb. 26, 1901. Serial No. 48,317. (No model.)



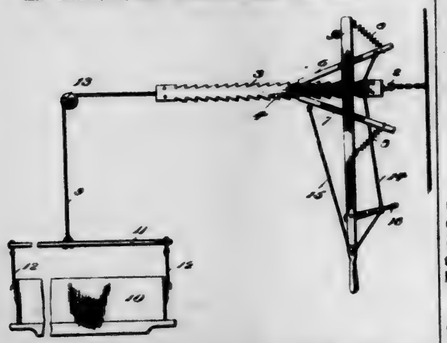
Claim.—In a loom having a weft-fork mechanism, a ratchet-gearing comprising an actuating-pawl, means for controlling the backward movement of the cloth-beam and means for throwing the said ratchet-gearing out of action when the weft-fork mechanism is operated, the combination of a sliding pawl *a* mounted between bars *c* and adapted to rest loosely on one of the ratchet-wheels, a holder-arm *b* in which the bars of the pawl may slide, a stop *s* between the said bars at one side of the guide or holder-arm and an adjustable screw *r* also mounted between the said

bars at the opposite side of the holder-arm in the manner and for the purpose substantially as described

709,583. PROCESS OF PRESERVING EGGS. WILLIAM SMITH, Christiania, Norway. Filed May 23, 1901. Serial No. 61,630. (No specimens.)

Claim.—Process for preserving eggs, which consists in first warming the fresh eggs in warm water for a few seconds and then immediately they are removed from the warm water, allowing them to cool in a solution of cold salt water, sal-ammoniac, and silicate of soda, in the manner and for the purpose substantially as described.

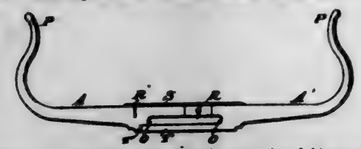
709,584. WAGON-BODY LIFTER. HERMAN SOTTEBIER, Union, Mo. Filed Apr. 5, 1902. Serial No. 101,564. (No model.)



Claim.—1. In hoisting mechanism, the combination of the following instrumentalities, namely, a bar composed of transversely-spaced members having opposite edges correspondingly toothed, a lever freely movable in the space formed between the members of said bar, spring-actuated pawls applied to said lever and located upon opposite sides of the bar for alternate coöperation with the teeth thereof, a second lever pivoted to the first-mentioned lever, and flexible connections between said second lever and the spring-actuated pawls for alternately throwing the latter out of engagement with the toothed bar, one of said flexible connections being deflected by passing around a portion of the first-mentioned lever, substantially as set forth.

2. The herein-described means for lifting wagon-bodies and the like, comprising a bar, attaching means at the ends of the bar for connection with the object to be lifted, a toothed bar comprising transversely-spaced members having opposite edges correspondingly toothed, a lever freely movable in the space between the members of the toothed bar, a hoisting-rope attached to the said lever and connected with the first-mentioned bar midway of its ends, spring-actuated pawls applied to the lever and located upon opposite sides of the toothed bar for alternate coöperation therewith, a second lever pivoted to the operating-lever, and flexible connections between said second lever and the spring-actuated pawls for alternately throwing them out of engagement with the toothed bar, substantially as specified.

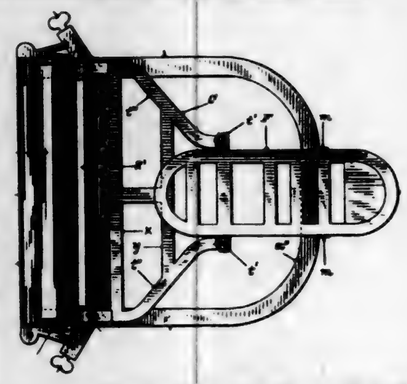
709,585. REIN-HOLDER. THOMAS I. THOMPSON, Lewisburg, Tenn. Filed Aug. 27, 1901. Serial No. 73,436. (No model.)



Claim.—A rein-holder comprising the parts A and A' pivoted together, a spring S fixed at one end to part A, and held yieldingly against part A', a tongue T projecting beyond the pivotal points of said parts and adapted to rest against a shoulder T', the adjacent faces of said tongue and parts A forming an elongated slot to receive a hook-strap of a harness, as set forth.

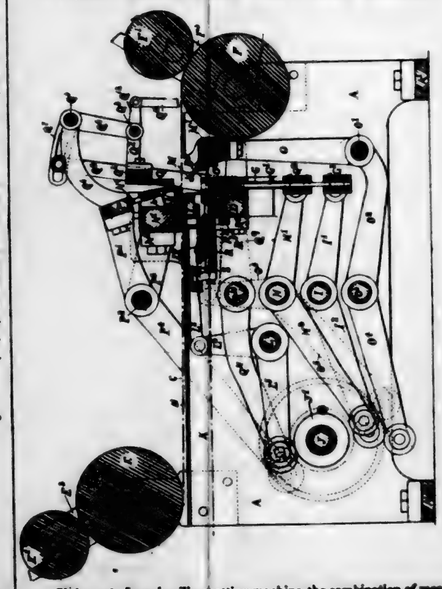
709,586. MOP-WRINGER. JOHN C. THOMSEN, Rock Island, Ill. Filed Sept. 23 1901. Serial No. 76,144. (No model.)

Claim.—1. A mop-wringer comprising a frame with means for clamping it to the top of a pail, a stationary roller journaled therein, a sliding yoke supported by said frame, a roller journaled in said yoke, and a foot-lever having its rear portion hinged to the edge of the frame and its front portion hinged to said yoke, substantially as described.



2. A mop-wringer comprising a frame with means for clamping it to the top of a pail, a stationary roller journaled therein, a sliding yoke supported by said frame, a roller journaled in said yoke, and a foot-lever having its rear portion hinged to the edge of the frame and its front portion hinged to said yoke, said foot-lever extending beyond both of its hinged connections, substantially as described.

709,587. CHENILLE-SPOTTING MACHINE. LOUIS O. TRIVETT and FRED RANDALL, Nottingham, England; said Randall assignor to said Trivett. Filed Oct. 24, 1900. Serial No. 34,167. (No model.)



Claim.—1. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, means for feeding the chenille, mechanism for cutting off a length of chenille and forming same into a staple, a net-registering instrument for selecting, positioning, and holding a thread of the fabric directly over the staple-forming mechanism comprising a stock, a point or projection on said stock to enter the net provided with a flute in its inner side across which a thread of the net can lie, and means for closing the staple on said thread.

2. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, means for feeding a plurality of lengths of chenille, mechanism for cutting off lengths of chenille and forming the same into staples, a plurality of net-registering instruments for selecting, positioning, and holding threads of said fabric over the staple-forming devices each of which comprises a stock, a point or projection on said stock to enter the net provided with a flute in its inner side across which a thread of the net can lie, and means for closing said staples on said threads.

3. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, means for feeding a plurality of lengths of chenille, mechanism for cutting off lengths of chenille and forming the same into staples, means for holding alternate chenille-feeders out of action, a plurality of net-registering instruments for selecting, positioning, and holding threads of said fabric each comprising a stock, a point or projection on said stock to enter the net provided with a flute in its inner side across which a thread of the net can lie, and means for closing said staples on said threads.

4. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, means for feeding a plurality of lengths of chenille, mechanism for cutting off lengths of chenille and forming same into staples, a holding-plate above the net fabric having a hole which is inclined to the face of the plate so as to run out at the lower front corner of the same forming openings in both its under and front face, a clenching device in said hole, a net-registering instrument beneath said fabric comprising a stock, a point or projection on said stock to enter the net provided with a groove or flute in its inner side across which a thread of the net can lie, means for causing the point on the registering instrument to pierce the fabric, means for moving said point up to the opening in said plate, and means for operating the staple-forming mechanism and clenching device to close a staple on the fabric in the cavity formed by the holding-plate and flute in the point of the registering instrument.

5. In a chenille-spotting machine the combination of means for intermittently moving the fabric, means for feeding lengths of chenille, mechanism for cutting off lengths of chenille and forming said lengths into staples, a holding-plate above the net fabric, a hole in said plate forming an opening in its edge above said staple-forming mechanism, a clenching device in said hole, a net-registering instrument beneath said fabric comprising a stock, a point or projection on said stock to enter the net provided with a flute in its inner side across which a thread of the net can lie, a brush above the fabric, means for causing said registering instrument and brush to meet at the plane of the fabric, means for moving the point of the registering instrument against the opening in the holding-plate, means for moving the brush in a direction away from the holding-plate and opposite to that in which the registering instrument is moved, and means for operating the staple-forming mechanism and clenching device to close a staple on the fabric in the opening in the holding-plate.

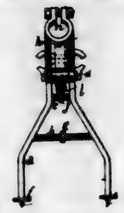
6. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, staple cutting and forming rams for each length of chenille, a bed to carry the said rams, a cutting-plate forming part of the bed, passages for the chenille on the under side of the cutting-plate, a chenille-feeder for each staple-forming mechanism, means for holding alternate chenille-feeders out of action, and means for closing said staples on the fabric.

7. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, mechanism for cutting off lengths of chenille and forming same into staples, a chenille-feeder for each staple-forming mechanism, a notched bar, below the feeders, a connection between each feeder and the notched bar, and means for closing said staples on the fabric.

8. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, mechanism for cutting off lengths of chenille and forming same into staples, a chenille-feeder for each staple-forming mechanism, means for holding alternate chenille-feeders out of action, a holding-plate above the net fabric having a hole above each staple-forming mechanism, a clenching-ram in each of said holes, and means for operating the staple-forming mechanism and clenching device to close said staples on the fabric.

9. In a chenille-spotting machine, the combination of means for intermittently moving the fabric, a plurality of rams beneath said fabric, an ejector within each ram, a cutting-plate between said rams and said fabric, a looper-bar, means for advancing said looper-bar opposite the operative ends of said rams and for withdrawing it, a plurality of extensions on the looper-bar, a feeder hinged to each of said extensions and engaging with the chenille, a bar beneath said feeders, a series of notches in said bar, a pin between each feeder and the notched bar, means for reciprocating said notched bar, a holding-plate above the net fabric having a plurality of inclined holes which run out at the angle of the bar forming openings on both the lower and front faces of the same, a clenching-ram in each hole, a plurality of net-registering instruments beneath said fabric each comprising a stock, a point or projection on said stock to enter the net provided with a groove or flute in its inner side across which a thread of the net can lie, a brush above the fabric, means for causing said registering instrument and brush to meet at the plane of the fabric, means for moving the projection of the registering instrument against the holding-plate, means for moving the brush in a direction away from the holding-plate and opposite to that in which the registering instrument is moved, means for moving the rams beneath the fabric up to the holding-plate, and means for operating the clenching-rams to clench the chenille staples against the lower ram, substantially as described.

709,588. CYCLE-REST. HANS U. VON TREUENFELS, Hanover, Germany. Filed Dec. 16, 1901. Serial No. 86,117. (No model.)



Claim.—In a cycle-rest the combination of a clamping part adapted to be secured to the frame-tubing close to the crank-axle bearing, a pin journaled in said clamping part, a bifurcated rest composed of two legs symmetrically bent out of the middle plane of the cycle, said legs being pivoted on said pin, cross-braces connecting the bent legs of the said rest, an extension of the said clamping part adapted to partly surround the crank-axle bearing, a clamp forming the end of the said extension adapted to be clamped about the frame-tube supporting the saddle or the legs of the rear wheel-fork, a helical spring, secured with one end to the upper cross-brace and with the other end to the said extension-clamp, and a wire, chain, cord, or the like, attached to the lower cross-brace, guided through suitably-arranged eyes or rings and adapted to be secured with its upper free end at different heights to the frame-tubing, the parts being constructed, arranged and working, substantially as and for the purpose set forth.

709,589. FOLDING HARROW. ALVA T. UPTON, Mount Vernon, Ill., assignor of one-half to Cyrus C. Johnson, Mount Vernon, Ill. Filed Apr. 16, 1902. Serial No. 103,186. (No model.)

Claim.—1. In combination with a harrow having transversely-disposed bars and flexible connections between them, a flexible element attached to the rear bar of the harrow, passed forwardly over the harrow and thence downwardly and rearwardly under the same, for the purpose set forth, substantially as described.

2. In combination with a harrow having transversely-disposed bars and flexible connections between them, a flexible element attached to the rear bar of the harrow, passed forwardly over the harrow and thence downwardly and rearwardly under the same, and a pedal-lug attached to said flexible element, for the purpose set forth, substantially as described.

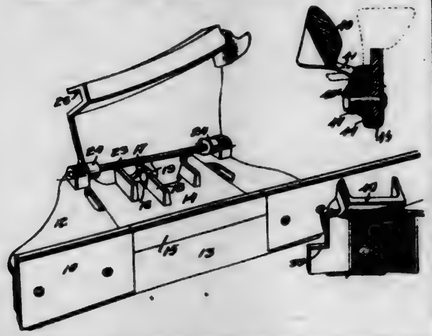
3. A flexible harrow having cross-bars and hinge-links flexibly connecting them together, said hinge-links having steps adapted to come in contact with each other when the harrow is folded, substantially as described.

4. A flexible harrow having cross-bars and hinge-links flexibly connecting them together, said hinge-links having mutually-engaging upstanding cars at their ends pivotally connected together and transversely-disposed steps extended laterally from said cars, said steps being adapted to come in contact with each other when the harrow is folded, substantially as described.

5. A flexible harrow having cross-bars and hinge-links flexibly connecting them together, said hinge-links having mutually-engaging steps on one side adapted to come in contact with each other when the harrow is folded in one direction with the points of its teeth outward, and adapted to turn in the reverse direction to dispose the harrow compactly with the points of its teeth inward, substantially as described.

6. A harrow having transversely-disposed bars, flexible connections between them, a flexible element attached to the rear bar of the harrow, passed forwardly over the harrow and thence downwardly and rearwardly under the same, whereby the harrow may be folded, and steps, coacting with the flexible connections, to support the bars when the harrow is folded, substantially as described.

709,590. TROLLEY-TRACK SWITCH. PAUL F. WERNER, Wilmington, Mass. Filed Apr. 7, 1902. Serial No. 101,734. (No model.)



Claim.—1. The combination of the interrupted main-line and branch-line tracks, a bracket secured to the opened sections of the main-line track and having its outer face flush with the surface of the track, a guideway formed in the upper surface of the bracket, a reciprocating slide guided therein and having a track-section movable into and out of alinement with the opened sections of the main-line track, a pair of opened legs carried by said slide, a pivoted branch-line member also having a track-section, a pin carried by the branch-line member and held in constant engagement with said legs to transmit the movement of the branch-line member to the slide, said branch-line member when in open position having its center of gravity to the rear of the supporting-pivot and carving through the pin and legs to hold the slide in proper position, substantially as specified.

2. The combination of the interrupted main-line and branch-line tracks, a bracket connected to the sections of the main-line track and having its upper surface recessed to form a guide, a slide disposed in the recessed portion and guided thereby, said slide having a track-section movable into and out of alinement with the sections of the main-line track, a depending recessed lug carried by said slide to prevent excessive outward movement thereof and to hold said slide from vertical movement, a pair of opened legs carried by the slide, a pivoted branch-line member also having a track-section, and a pin carried by the branch-line member and engaging between the legs to thereby assist in holding the slide in proper position and to prevent excessive rearward movement of the branch-line member.

3. The combination of the main-line and branch-line tracks, switch members having track-sections for preserving the continuity of the main line, or for connecting the main line and branch line, a pivotally-mounted locking-block carried by the branch-line track, an operating-arm and lug forming part of said block, and a projecting finger carried by one of the switch members and adapted to operatively engage said arm and lug to effect the movement of the locking-block to operative or inoperative position.

4. In a device of the class specified, the combination of the track, a pivot-plate fitted to one face thereof and provided with a projecting lip extending under and embracing the edge of the track, a securing means passing through the plate and track and serving in connection with the lip to hold said plate in proper position, there being a pivot-recess formed partly by the plate and partly by the rear face of the track, a locking-block pivoted in said recess, and means for automatically moving said block to operative and inoperative positions.

5. In a device of the class specified, the combination with the track, of a plate secured thereto, a block pivotally connected to the plate and adapted to be moved across the top of the rail, an operating-arm 41 and a lug 43 disposed at an angle to each other and forming a part of the block, and a pivoted switch-track member having a projecting finger for operative engagement with the arm to move the block to operative position, said finger being adapted to engage the lug when the switch-track member is moved in the opposite direction to move said locking-block to inoperative position.

709,591. SASH-LOCK. WILSON BENNETT, Waynesboro, Va. Filed Sept. 10, 1901. Serial No. 74,918. (No model.)

Claim.—1. A sash-lock consisting of a plate adapted to be attached to a sash, a lever attached to said plate, a second plate adapted to be attached to the opposite sash, said second plate having an arched portion, a D-shaped link retained by said arched portion and adapted to pass over the free end of the said lever.

2. A sash-lock consisting of a plate adapted to be attached to a sash, a lever attached to said plate, a second plate having a perforation and an arched portion, a D-shaped link retained by said arched portion and adapted to pass over the free end of the lever, said lever having a tost adapted to enter said perforation.

3. A sash-lock consisting of a plate adapted to be attached to a sash, said plate having a perforation, a dome erected on said plate about said perforation, said dome having two channels merging into each other at right angles, a lever secured at one end under said dome and being free to swing through the channels, a second plate adapted to be attached to the opposite sash, said second plate having a perforation and an arched portion, a D-shaped link retained by said arched portion, said lever having a tost adapted to enter the perforation of the said second plate.

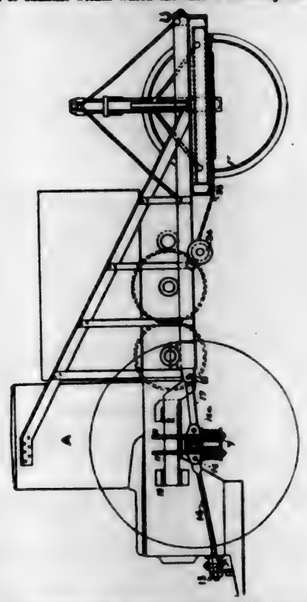
4. A sash-lock consisting of a plate adapted to be attached to a sash, a dome erected on said plate, said dome having two channels cut therein and merging into each other at an angle, a lever secured at one end under said dome and being free to swing through the channels, said lever being retained from revolving axially, said lever being adapted to swing in two directions, but when having entered one channel being prevented from moving toward the other channel by the intermediate portion of the dome between the said channels, a second plate adapted to be secured to the opposite sash and having a means for securing the free end of the lever.

709,592. TRACTION-ENGINE. DANIEL BEST, San Leandro, Cal. Filed June 28, 1902. Serial No. 112,777. (No model.)

Claim.—1. The combination in a traction-engine of the frame; the bearing-wheels; the axle; transverse plates forming a channel within which the axle is movable; yokes suspended directly from the axle, and plates through which the ends of the yoke pass; and springs disposed between the last-named plates; said first-named plates bearing directly upon the uppermost of the last-named plates.

2. The combination with a traction-engine and frame of a main axle bearing and traction wheels carried upon the ends thereof, yokes passing over and suspended from the axle, plates to which the ends of said yokes are secured, springs carried upon said plates, supports upon which the engine-frame or boiler rests, said supports including transverse plates standing vertically on edge and constructed to receive and form a guide or channel in which the axle is movable, said supports resting upon the uppermost of the first-named plates.

3. The combination with a traction-engine, the frame thereof, of an axle having bearing and traction wheels upon each end, yokes passing over said axles inside of the spindles upon which the wheels are mounted, plates suspended from the lower ends of the yokes, springs supported upon said plates, other plates resting upon the tops of the springs through which plates and springs the yokes pass, parallel bars on edge extending transversely beneath the boiler and frame of the machine, the ends of said bars resting upon the plates carried by the springs, said transverse bars forming a trough or channel within which the axle is vertically movable.



4. The combination with a traction-engine and its frame, of transverse bars forming a channel, a main wheel-axle extending through and movable within said channel and having traction and bearing wheels turnable upon the outer ends thereof, horizontal plates and springs upon which the channel-irons rest, similar plates upon which the springs rest and yokes passing over the axle having the legs extending down through the springs and plates and secured to the lowermost plates.

5. The combination with a traction-engine and its frame of an axle upon the ends of which the bearing and traction wheels are carried, a channel-frame extending transversely beneath the boiler and engine-frame which are supported thereon and within which channel the axle is vertically movable, springs and supporting yokes and plates connecting the axle and the boiler-support whereby a vertical yielding movement is effected, pivoted links extending substantially horizontally front and rear from the channel-frame and connecting the axle-supports with the main frame and the boiler in front of and behind the axle.

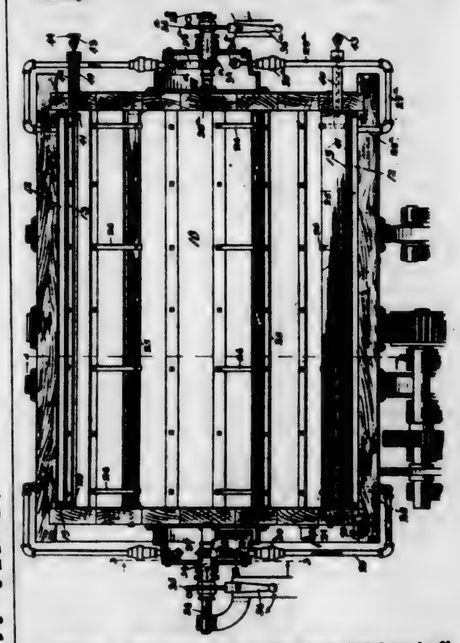
6. The combination in a traction-engine of a boiler and frame, an axle with bearing and traction wheels at each end, springs suspended below the axle and located intermediate of the axle and the main frame and boiler, whereby a vertical yielding movement is effected, upward transverse plates forming a vertical guide for the axle, a bar extending across the rear of the boiler, links connecting the ends of the bar with the vertical guide between which the axle moves, other links connecting said guide with the front of the frame.

7. In a traction-engine, a front steering-wheel, a circular ring-frame within which it is journaled, an exterior rigid circular frame connected with the main engine-frame within which the steering-wheel ring is turnable, vertically-journaled rollers interposed between the two rings, frames extending upwardly from the main and from the wheel frame respectively, guide-sheaves carried by said frames substantially centrad above the wheel, and a spring interposed between said sheaves.

8. A traction-engine steering-wheel, a circular frame to which it is journaled, an exterior circular frame carried by the main engine-frame, vertically-journaled rollers interposed between the rings, vertically-disposed frames extending upwardly from the main and from the wheel frame respectively convergent so as to stand substantially in line above the wheel, a spring interposed between the two frames, a vertical guide-stem extending through the spring from one frame to the other, and a ball-bearing support between the spring and the wheel-frame upon which it is carried.

9. A traction-engine steering-wheel, a circular ring to which it is journaled, an exterior circular ring carried by the main engine-frame, journaled rollers interposed between the rings, vertically-convergent frames carried by the two circular rings, a vertical guide-stem extending between the two, and a surrounding spring, chains connected with the steering-wheel circle, and winding-drums upon the main frame whereby the chains are moved to turn the wheel.

709,598. APPARATUS FOR TREATING PULVERIZED ORES OF GOLD OR SILVER. DANIEL C. BOLEY, Chicago, Ill., assignor to Henry Hunt, Pekin, Ill. Filed Sept. 23, 1901. Serial No. 76,365. (No model.)



Claim.—1. In an apparatus for treating finely-divided ores by filtration, the combination with a moving filter-surface, of means for creating a vacuum beneath the filter as it passes a portion of its course, and means for producing at a different time an air-pressure backward through the filter, at the same portion of its course, substantially as specified.

2. In an apparatus for treating finely-divided ores by filtration, the combination with a moving filter-surface, of means for creating a vacuum beneath the filter as it passes a portion of its course, and means for producing at the same time an air-pressure backward through the filter as it passes another portion of its course, and with means for producing at a different time an air-pressure backward through the filter, at the same portion of its course, substantially as specified.

3. The combination of the rotatable barrel having around its inside surface a series of chambers separated from the interior of the barrel by filtering fabric, and means for inducing a vacuum in said chambers during a portion of the revolution of the barrel, said means consisting in part of pipes containing valves controlled automatically by a cam caused to operate by the motion of the barrel, substantially as specified.

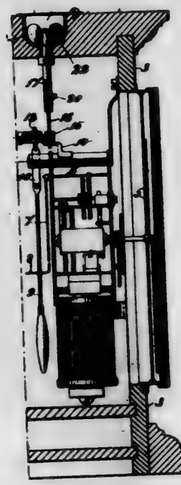
4. The combination of the rotatable barrel having around its inside surface a series of chambers separated from the interior of the barrel by filtering fabric, means for inducing a vacuum in said chambers during a portion of the revolution of the barrel, and means for producing an air-pressure backward through the filter fabric at a different time, substantially as specified.

5. The combination of the rotatable barrel having around its inside surface a series of chambers separated from the interior of the barrel by filtering fabric, means for inducing a vacuum in said chambers during a portion of the revolution of the barrel, said means consisting in part of pipes containing valves controlled automatically by a cam caused to operate by the motion of the barrel, and means for producing an air-pressure backward through the filter fabric at a different time, substantially as specified.

6. In an apparatus for treating finely-divided ore by filtration, the combination of the rotatable barrel, the series of filtering-chambers around the interior surface of the barrel, the filtering fabric separating the chambers from the barrel, the radial longitudinal internal wings, the means for inducing a vacuum or pleasure in the chambers consisting of pipes provided with valves leading to an axial pipe connected with a vacuum and pleasure reservoir, the connection being controlled by cocks, substantially as specified.

7. The combination of the rotatable barrel, the series of filtering-chambers separated from the interior of the barrel by filtering fabric and means for inducing a vacuum in said chambers during a portion of the revolution of the barrel, and means for drawing the liquid contents out of said chamber, consisting in part of pipes, each chamber having two outlets to the pipes, so that the liquid contents will flow out whatever the position in the vacuum zone the chamber may occupy during the rotation of the barrel, substantially as specified.

709,594. **PENDULUM-REGULATOR FOR CLOCKS.** JOSEPH BUTCHER, New York, N. Y. Filed Feb. 21, 1902. Serial No. 95,023. (No model.)



Claim.—1. The combination in a clock, of the pendulum, the spring forming a prolongation of the latter, the screw on and forming a prolongation of said spring, the crotch in which said spring plays, the nut on said screw, means for collaring said nut, and means for rotating said nut for raising and lowering the pendulum.

2. The combination with a clock-case and a clock inclosed therein, of the clock-pendulum, the flat spring forming a prolongation of said pendulum, the crotch, a screw device for raising and lowering the pendulum, and means for operating said screw device, said means comprising an arbor extending out at the top of the clock-case, a thumb-piece thereon occupying a recess in the top of the case, and a pinion thereon gearing with the wheel-nut of the said screw device.

3. The combination with the case of a clock, having a recess in its top, an arbor extending down from said recess and having a pinion 15 at its lower end, and the said pinion, of the crotch, the pendulum, its spring, engaging said crotch, the screw on the upper end of said spring and parallel with said pinion-arbor, and a collared wheel-nut on said screw and gearing with said pinion.

4. The combination with a clock-case having a recess in its top, and an extensible arbor extending down into the case from said recess, of the clock-pendulum, its spring, the crotch which said spring engages, the screw on said spring, and the collared wheel-nut on said screw.

5. The combination with the movement-frame of a clock provided with a crotch for the pendulum-spring, and the case of the clock, having a recess in its top, of the pendulum, its spring, engaging said crotch, the screw on and forming a prolongation upward of said spring, the wheel-nut on said screw, the means on the movement-frame for collaring said nut, a telescopic and extensible arbor dependent into the case from the recess in the top thereof and parallel with the said screw on the pendulum-spring, a thumb-piece on said arbor in said recess, and a pinion on said arbor and in gear with said wheel-nut.

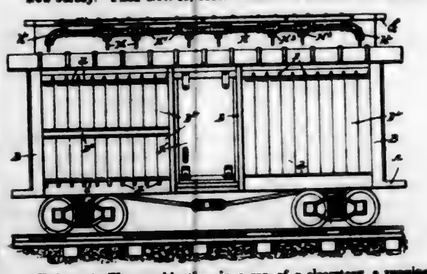
709,595. **GLOVE.** ROBERT H. GARDEN, San Francisco, Cal. Filed July 3, 1902. Serial No. 114,259. (No model.)

Claim.—1. The combination with a glove of a reinforcing palm-piece having an extension surrounding the forefinger, and a corresponding extension surrounding the inner portion of the thumb.

2. The combination with a glove of a reinforcement consisting of a piece extending across the palm from the outer side of the little finger, thence extending up and surrounding the inner part of the forefinger, and having an extension in continuation therewith surrounding the inner portion of the thumb.

3. In combination with the palm and finger portion of a glove, a reinforcing-piece consisting of a part to surround the inner portion of the thumb, a part to surround the inner portion of the forefinger and a part extending across the palm, all cut from a single continuous piece of material.

709,596. **STOCK-CAR.** WILLIAM CLINE, Lancaster, Pa., assignor to the Cline Stock-Car Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Nov. 13, 1899. Serial No. 736,742. (No model.)



Claim.—1. The combination, in a car, of a clearstory, a running-board extending lengthwise of the top of the clearstory, outwardly-projecting flanges on the sides of the running-board and having gutters lengthwise thereof, joists supporting the running-board, and doors hinged to the side walls of the clearstory and adapted, when closed, to have their swinging edges rest on said flanges of the running-board.

2. The combination, in a car, of a clearstory, joists extending across the clearstory and having gutters, a plate countersunk in the joists and extending lengthwise of the clearstory, a running-board of less width than said plate and resting on the center thereof, gutters longitudinally of the projecting edges of said plate and connecting with gutters in the joists, and doors hinged to the side walls of the clearstory and adapted, when closed, to have their edges rest on the projecting edges of said plate.

3. The combination, in a car, of a clearstory, a door on the top of the clearstory, a rod or tube extending along the side of the clearstory, and hinge-straps connecting said door and the rod, for the purpose specified.

4. The combination, in a car, of a clearstory, a door on the top of the clearstory, jaws projecting outward from the side of the clearstory, hinge-straps projecting from said doors, and a hinge-pin connecting the outer ends of the jaws and of the hinge-strap, for the purpose specified.

5. The combination, in a car, of a clearstory, a door on the top of the clearstory, a rod or tube extending along the side of the clearstory, jaws projecting outward from the rod or tube, hinge-straps projecting from said doors, and a hinge-pin connecting the outer ends of the jaws and of the hinge-strap, for the purpose specified.

6. The combination, in a car, of a clearstory, a running-board extending lengthwise of the center of the clearstory and having outwardly-projecting flanges provided with gutters, joists supporting the running-board and having gutters connected with the gutters in the flanges, series of doors at the sides of the running-board and having their edges adapted

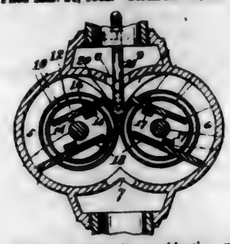
to rest on said flanges and on the joists, jaws projecting outward from the sides of the walls of the clearstory, outwardly-projecting hinge-straps on the doors, and hinge-pins connecting the outer ends of said jaws and of the hinge-straps, for the purpose specified.

7. The combination, in a car, of a clearstory, a door on the top of the clearstory, a ventilator-flue extending along the outside of a wall of the clearstory, branches of said flue and extending through the wall of the clearstory and supporting said flue in place, jaws on said flue, hinge-straps on the door, and hinge-pins connecting the outer ends of said jaws and of the hinge-straps, for the purpose specified.

8. The combination, in a car, of a clearstory, a door on the top of the clearstory, a ventilator-flue extending along the outside of a wall o the clearstory, branches of said flue and extending through the wall of the clearstory and supporting said flue in place, outwardly-projecting jaws on said flue, hinge-straps extending outward from the door, and hinge-pins connecting the outer ends of said jaws and of the hinge-straps, for the purpose specified.

9. The combination, in a car, of a clearstory, a running-board extending lengthwise of the clearstory and having outwardly-projecting flanges provided with gutters, joists supporting the running-board and having gutters connected with the gutters in the flanges, series of doors at the sides of the running-board and having their edges adapted to rest on said flanges and on the joists, ventilator-flues extending along the outside of the walls of the clearstory, branches on said flues and extending through the walls of the clearstory and secured therein by nuts, outwardly-projecting jaws on said flue, hinge-straps extending outward from the doors, and hinge-pins connecting the outer ends of said jaws and of the hinge-straps, for the purpose specified.

709,597. **ROTARY FORCE-PUMP.** SAMUEL M. FRANK, San Antonio, Tex. Filed Mar. 21, 1902. Serial No. 99,302. (No model.)



Claim.—1. In a force-pump, the combination, with the cylinders, and the rotary pistons, of the slidable valves adapted to work through the walls of the pistons at points diagonally opposite, the valve-shoes, and the roller-valve operated between the pistons to check the backward escape of air between the pistons.

2. The combination, with the rotary pistons, the valve-shoes at each end of the pistons, and the spring-valves working against the shoes and having a projection or pin and slidable through the piston walls at points diagonally opposite, of the stop-plates adjustably secured upon the interior of the pistons and engaged by said projections or pins to control the outward movement of the valves.

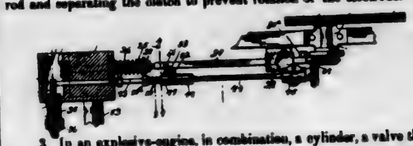
3. The combination, with the removable valve-shoes having a groove, of the roller-valve journaled in the shoe-grooves, and the screw-rods having collars through which the roller-valve is revolved, and means to adjust the rods to vary the position of the said valve.

4. The combination, with the communicating cylinders, a shaft extending through each cylinder, a piston secured on each shaft and having valveways out of line with the shafts or the center of the pistons, a pair of valves slidable parallel with each other through the walls of the pistons, and the springs to project the valves, of the valve-shoes to retract the valves, the roller-valve operated between the pistons, and means to vary the bearing of the roller-valve on the pistons.

709,598. **ELECTRIC IGNITER FOR EXPLOSIVE-ENGINES.** EDWARD A. GRAY, Plainfield, Ill. Filed Oct. 1, 1901. Serial No. 77,210. (No model.)

Claim.—1. In an explosive-engine, in combination, a cylinder, a pair of intermittently-contacting igniting-electrodes one of which is rotatable, means for rotating said electrode, a charge-controlling valve, means for actuating the valve, a governor for interrupting the action of the valve, and an adjunct of the valve-actuating means engaging the electrode-rotating means to hold the rotatable electrode against movement.

2. In an explosive-engine, in combination, a cylinder, intermittently-contacting electrodes, one of which is rotatable, means for rotating said electrode, a clutch-controlling connection between the rotatable electrode and the rotating means, a reciprocating rod, and a detent carried by the rod and separating the clutch to prevent rotation of the electrode.



3. In an explosive-engine, in combination, a cylinder, a valve therefor, a rod controlling the valve, means for moving the rod, a pair of electrodes one of which is rotatable, a shaft to which the rotatable electrode is fixed, and a connection between such shaft and the valve-controlling rod for holding the rotatable electrode against movement.

4. In an explosive-engine, in combination, a cylinder, a valve therefor, a rod controlling the valve, means for moving the rod, a pair of electrodes, a rotating shaft to which one of the electrodes is fixed, a clutch for the shaft, an arm carried by the rod and for separating the clutch to throw the electrodes out of action, a governor, and a lever operated by the governor for holding the rod against movement.

5. In an explosive-engine, in combination, a cylinder, an exhaust-valve, a rod controlling the valve, means for moving the rod, a pair of electrodes one of which is rotatable, a shaft to which the rotatable electrode is fixed, and an arm carried by the valve-rod for holding the rotatable electrode against movement.

6. In an explosive-engine, in combination, a cylinder, a valve therefor, a rod controlling the valve, a cam actuating the rod, a reciprocating electrode, a second electrode, a rotating shaft comprising two sections to one of which the second electrode is fixed, a clutch connecting the two shaft-sections, a pin projecting from one of the clutch members, and an arm secured to the valve-rod and having a beveled extension for engaging the pin to uncouple and also turn the shaft-section to which the second electrode is fixed.

7. In an explosive-engine, in combination, a cylinder, a valve therefor, a rod for opening the valve, means for moving the rod, a pair of electrodes one of which is rotatable, a shaft to which the rotatable electrode is fixed, means controlled by the valve-rod for holding the rotatable electrode against movement, a governor, and connection between the governor and the valve-rod.

8. In an explosive-engine, in combination, a cylinder, a valve therefor, a rod for opening the valve, a cam engaging the rod, a pair of electrodes one of which is rotatable, a shaft to which the rotatable electrode is fixed, an arm carried by the valve-rod for holding the rotatable electrode against movement, a governor, and connection between the governor and the rod.

9. In an explosive-engine, in combination, a cylinder, a valve therefor, a rod controlling the valve, means for moving the rod, a pair of electrodes, a shaft comprising two sections to one of which one of the electrodes is fixed, a clutch coupling the two sections, an arm carried by the valve-rod and uncoupling the clutch to throw the electrodes out of action, and a spring for throwing the clutch into engagement when released by the arm.

10. In an explosive-engine, in combination, a cylinder, a valve therefor, a cam driven by the engine and moving the rod, a movable electrode, a second electrode, a shaft comprising two sections to one of which the second electrode is fixed, a clutch for coupling the two shaft-sections and one of the members of which is slidably mounted upon the shaft, a pin projecting from such clutch member, an arm secured to the valve-rod and having a beveled extension for engaging the pin to uncouple the clutch and also turn the shaft-section to which the electrode is fixed, a spring for coupling the clutch when the arm is withdrawn from the pin, a governor, and a pivoted lever actuated by the governor and for engaging the valve-rod when advanced by the cam.

11. In an explosive-engine, in combination, a cylinder, intermittently-contacting electrodes one of which is rotatable, means for rotating said electrode, a clutch controlling connection between the rotatable electrode and the rotating means, and means timed to set intermediate of contacts between the electrodes for separating the clutch members to prevent movement of the rotatable electrode.

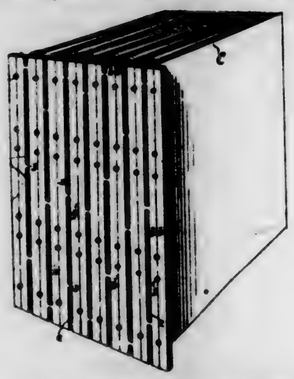
12. In an explosive-engine, in combination, a pair of electrodes one of which is moved intermittently into contact with the other, a shaft to which the moving electrode is fixed, a valve, a rod controlling the valve, a pin rotatable with the electrode-shaft, and a cam carried by the valve-controlling rod and for engaging the pin to throw the moving electrode out of action.

13. In an igniting device for explosive-engines, in combination, a pair of electrodes, a shaft comprising two sections and to one of which one of the electrodes is secured, a clutch for coupling the two sections, a spring for holding the clutch members in engagement, a valve, means for

operating the valve, and means carried by the valve-operating means for operating the clutch members.

14. In an igniting device for explosive-engines, in combination, a pair of electrodes, a shaft comprising two sections and to one of which one of the electrodes is secured, a clutch for coupling the two sections, a spring for holding the clutch members in engagement, a valve, means for operating the valve, means carried by the valve-operating means for operating the clutch members, a governor, and means controlled by the governor for holding the valve-operating means against movement.

709,599. BOOKBINDING-SHEET. GODFREY HAGEN, Brooklyn, N. Y. Filed May 11, 1901. Serial No. 59,705. (No model.)



Claim.—1. As a new article of manufacture, an integral strip-sheet for backing and assembling book-signatures, embodying a plurality of pairs of strips, adjacent members of two pairs being connected by bridges and having notches which register with each other, and the members of each pair being in parallel position with a uniform intervening space bridged by integral narrow connecting-necks extending between them substantially as shown and described.

2. As an improved article of manufacture, an integral strip-sheet for backing and assembling book-signatures, embodying pairs of strips in parallel position, adjacent members of two pairs having notches which register with each other, said members being connected by bridges, and the members of each pair being separated by a uniform intervening space bridged by integral narrow connecting-necks, said strip-sheet being provided with and carrying upon its back an adhesive substance, whereby it may be applied to a flexible base, substantially as shown and described.

3. As an improvement in bookbinding sheets for assembling book-signatures, the combination, with a flexible base or fabric, of an integral strip-sheet embodying pairs of strips, adjacent members of two pairs having notches in their meeting edges which register with each other, said members bridged by integral portions, said pairs being in parallel position, and the members of each pair being separated by uniform intervening space bridged by integral narrow connecting-necks, and means for attaching said strip-sheet to the flexible base, substantially as shown and described.

709,600. MEASURING DEVICE. EDGAR HILL, Philadelphia, Pa. Filed Oct. 21, 1901. Serial No. 79,232. (No model.)

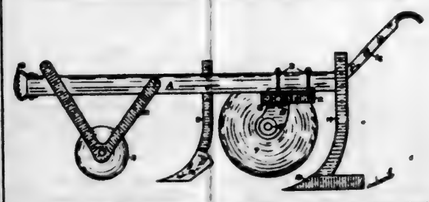
Claim.—1. A measuring instrument, a casing, a dial carried by the casing, hands pivoted in the casing, one hand adapted to record the revolution of the other, a suitable train of gearing for operating the hands, a leg secured to the casing, a second leg pivoted to the casing at a point eccentric to the pivotal point of the initial gear-wheel of the train of gears, a link connecting the movable leg with the initial gear-wheel, the distance the movable leg is pivoted from the pivotal point of the initial wheel to be set so that the dial will register correctly distances measured by the legs upon a straight line, substantially as and for the purpose specified.

2. In a measuring instrument of the character described, a casing, an indicating device carried by the casing, an initial gear-wheel pivoted in the casing and adapted to actuate and control the indicating device, a leg secured to the casing, a second leg pivoted to the casing at a point eccentric to the pivotal point of the initial gear-wheel, an arm D' extending outward from the movable leg, a link pivoted to said arm, a pin carried by the initial gear-wheel, said link connected to said pin, pointers adjustable on the legs, graduations for indicating the scale of the drawing to be measured represented upon the legs, substantially as and for the purpose specified.

3. In a device of the character described, a casing, a toothed wheel journaled within the casing, a leg secured to the casing, a second leg pivoted to the casing at a point eccentric to the pivotal point of the toothed wheel, said movable leg adapted to rotate the toothed wheel equal distances for equal distances measured by the legs upon a straight line, substantially as and for the purpose specified.

4. In combination with a device of the character described, a casing, a dial located upon the front of the casing, a circle of graduations represented upon the dial, a hand pivoted in the center of the dial, a train of gears adapted to actuate said hand, a hand pivoted to the arbor of the initial gear of the train of gears, a series of figures arranged concentric to the pivotal point of the initial gear, the second hand adapted to record the revolutions of the first-named hand, a leg secured to the casing, a second leg pivoted to the casing eccentric to the pivotal point of the initial gear, a connection between the movable leg and the initial gear, pointers located upon each of the legs and adapted to be adjusted along the same, graduations formed upon each of the legs, a coil-spring so set as to be tightened when the legs are separated, substantially as and for the purpose specified.

709,601. CULTIVATING-PLOW. ALBERT HOEFER, Pinnsville, Hawaii. Filed June 26, 1902. Serial No. 113,255. (No model.)



Claim.—1. The combination in a cultivator of a pair of angularly-journaled disks upon each side the beam, the shovel-plow traveling centrally from front of said disks and a subsoiling-plow fixed to travel centrally behind the disks.

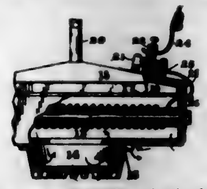
2. The combination in a cultivator of disks, plates or standards from the lower ends of which they are journaled and turnable, a triangular casting to which the upper ends of the standards are secured, a plow-beam and means for securing the casting to the beam, a shovel-plow having its standard connected with the beam and located in front of the disks and a subsoil-plow located in the rear of the disks.

3. A land-cultivating apparatus consisting of a beam, a triangular casting secured to the beam having perforations in its convergent sides, plates or standards adjustably bolted to said sides of the casting extending downwardly and forming supports for journal-shafts, disk plows mounted thereon converging from the rear toward the front, a shovel-plow having its standard adjustably connected with the plow-beam and located in front of the disks, guiding-handles carried thereby and a supporting-wheel adjustably connected with the front of the plow-beam.

4. A land-cultivating apparatus consisting of a plow-beam having a bearing-wheel adjustably connected with the front and handling clevises, a double or shovel plow having a standard adjustably connected with the plow-beam, a triangular casting adjustably secured to the plow-beam convergent from the rear toward the front, plates or standards adjustably secured to said convergent sides and movable so as to bring them nearer to or further from each other, disks journaled and turnable from the lower ends of said standards and correspondingly movable to or from each other, a subsoiling-plow having a standard adjustably connected with the rear of the beam and handles carried therewith.

5. A land-cultivating apparatus comprising a beam with centrally-located adjustable plows near the front and rear ends, a pair of intermediate divergently-mounted revolvable disks, a support for the hangers of said disks, consisting of a triangular casting adjustably secured to the beam and convergent toward the front, and attachments by which the hangers may be moved forward or backward along the convergent sides to move the disks to or from each other.

709,602. ELECTRIC BRANDER. HARRY L. JENKINS and OSCAR F. F. ROEHLAMB, Indianapolis, Ind., assignors of one-third to MAX DAVIS, Indianapolis, Ind. Filed Mar. 31, 1902. Serial No. 100,872. (No model.)



Claim.—1. In an electric brander, a heating-box containing a plurality of electrically-connected heating-coils, a rubber or depression from the bottom of the heating-box having outside branding characters, said rubber having communication with the outside air and a cover for the heating-box having a dead-air space.

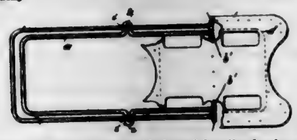
2. In an electric brander, a heating-box containing a plurality of electrically-connected heating-coils, a rubber or depression from the bottom of the heating-box having outside branding characters, said rubber having communication with the outside air, and a cover for the heating-box having a dead-air space therein, binding-posts, a supporting-plate for said posts of material which is a poor conductor of electricity, said plate supported above the cover of the box to provide an air-space between it and said cover, electric-current-supply wires connecting with said binding-posts and wires connecting the posts with the heating-coils.

709,603. SCREW-DRIVER. JAMES F. LARSEN, Chicago, Ill. Filed Mar. 28, 1902. Serial No. 100,693. (No model.)

Claim.—1. The combination with a hollow handle, of a rod located therein and having on its lower end a collar, a bit having at its upper end a crank or horizontal portion located in said collar, and a locking member movably secured on the lower end of the handle and having means to engage the crank of the bit, substantially as described.

2. The combination with a hollow handle having in its upper end a recess, of a rod located in the hollow of the handle and having on its lower end a collar, a spring-actuated head on the upper end of the rod within the recess of the handle, a bit having at its upper end a crank or horizontal portion provided with a groove and located in said collar, and a locking member movably secured on the lower end of the handle and having a projection to fit in the groove of the crank, substantially as described.

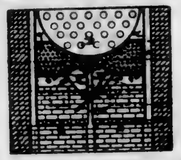
709,604. GRAPPLE FOR LUBRICATING-PADS. JOHANNES LEMKWITZ, Witten, Germany. Filed Feb. 24, 1902. Serial No. 95,626. (No model.)



Claim.—1. A pair of crossed U-shaped handles having short laterally-projecting pivots at their free ends, the side portions of the said handles being free to spring laterally, and means for pivotally connecting the middle parts of the side portions of the said handles, substantially as set forth.

2. A pair of crossed and pivoted U-shaped handles formed of bent rods having laterally-projecting pivots at their free ends, the side portions of one of the said handles being bent around to form eyes *i*, and the side portions of the other said handle being bent double to form projecting pivots *k* which engage with the said eyes, substantially as set forth.

709,605. BOILER-FURNACE. ALEXANDER MIER, Joliet, Ill. Filed Feb. 17, 1902. Serial No. 94,307. (No model.)

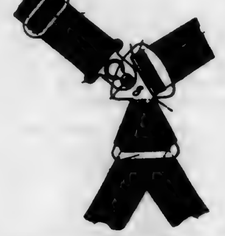


Claim.—1. In a furnace, a fire-box divided longitudinally into two compartments provided with separate doors at their front ends and separate dampers at their rear ends, a flue located at the front end portion of each compartment, said flue formed of perforated plates, and closed at its ends so that the smoke and gases must pass through the perforations in said plates, both upon entering and leaving said flue, substantially as set forth.

2. In a furnace, a fire-box divided longitudinally into two compartments provided with separate doors at their front ends and with separate dampers at their rear ends, a flue located at the front end portion of each compartment, said flue formed of perforated plates, and closed at its ends so that the smoke and gases must pass through the perforations in said plates upon entering and leaving said flue, and means for closing the openings in one or more of the said plates, substantially in the manner and for the purpose set forth.

3. In a furnace, a fire-box divided longitudinally into two compartments provided with separate doors at their front ends, and with separate dampers at their rear ends, a flue located at the front end portion of each compartment, said flue formed of perforated plates, and closed at its ends so that the smoke must pass through said perforations, and said flue having plates extending downwardly toward the bed of the fire, and means for closing one or more of said plates against the passage of smoke therethrough, substantially in the manner and for the purpose set forth.

709,606. LADY'S HOSE-SUPPORTER. LOUIS A. FERRAVAL, Jersey City, N. J., assignor to Frank & Guttmann, New York, N. Y., a Firm. Filed July 3, 1902. Serial No. 114,183. (No model.)



Claim.—1. A hose-supporter comprising a belt, a plate connected thereto, said plate having a loop and a continuous strip interwoven through the loop to form a pair of stocking-supporting straps.

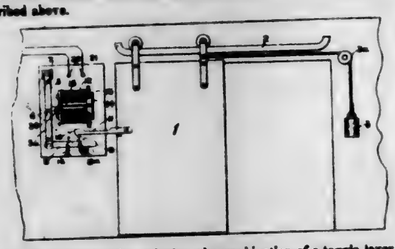
2. A hose-supporter comprising a belt, a plate connected thereto, said plate having a triangular loop and a continuous strip interwoven through the loop to form a pair of diverging stocking-supporting straps extending obliquely to a vertical line through the plate.

3. A hose-supporter comprising stocking-supporting straps, a plate secured thereto and a belt, said plate having elongated slots therein arranged diagonally to the vertical line through the plate for permanently securing one end of the belt to the plate, the other end of the belt being fitted to be removably secured to the said plate.

709,607. ELECTRICAL RELEASER FOR FIRE-DOORS, &c. HENRY J. PERLMAN, Lincoln, Nebr. Filed Mar. 16, 1897. Serial No. 627,772. (No model.)

Claim.—1. In automatic release devices the combination of a toggle-lever pivoted to a frame or beam, a locking-lever pivoted to said beam and having one arm jointed to said toggle-lever, the other arm adapted to engage and hold a hook when the toggle-lever is in the right position, said hook being attached to the door or other device to be released, an electromagnet mounted upon said frame and provided with a movable, pivoted armature having a rod or bar connected therewith and, adapted, upon movement of said armature, to shift or bend the toggle-lever to allow the lock-

ing-link to be withdrawn from locking engagement, an electric battery and an electric circuit for energizing said electromagnet to effect the movement of said armature substantially as described and for the purpose as described above.



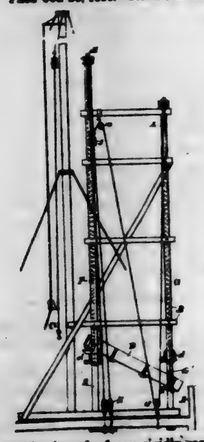
2. In automatic release devices the combination of a toggle-lever, a locking-lever jointed to said toggle-lever, an electromagnet having a pivoted movable armature, a rod or bar connected to said armature and thus adapted to transmit the movement of the armature to the joint of the toggle-lever sections, and to shift or bend same out of the rigid position, to allow the locking-link to disengage the locking-lever, an electric circuit deriving electric current from a battery or other source of electricity for energizing said electromagnet, to produce movement of the armature, a second electric circuit containing a source of electricity, an electromagnetic switch, and thermostatic devices, whereby, when the temperature in the proximity of the thermostatic devices reaches a dangerous point or degree the release-circuit is closed, substantially as and for the purpose described.

709,608. TICKET-HOLDER FOR CAR-SEATS. Gustave H. Ranzau, Sr., New York, N. Y., assignor to himself and Charles Wedin, New York, N. Y. Filed Jan. 15, 1902. Serial No. 89,813. (No model.)

Claim.—1. A ticket-holder comprising a base member adapted to be secured to a support, a clamping member extending longitudinally over the base member and having a convex under surface to contact with the base, and a block interposed between the two members.

2. A ticket-holder comprising a base member adapted to be secured to a support, a clamping member extending over said base member secured thereto at one end and turned upward at its free end, and a block interposed between the two members at their connected ends.

709,609. ADJUSTABLE LOADING-CHUTE. Louis Rosenfeld, New York, N. Y. Filed Oct. 26, 1900. Serial No. 734,344. (No model.)



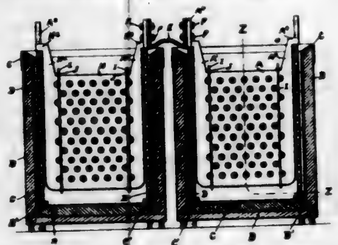
Claim.—The combination of a frame rigidly secured to the deck of a vessel, an inclined chute, one end of said chute resting upon a transverse timber having its ends slidable in vertical guides on the frame, the other end of said chute suspended directly from a second transverse timber disposed in the same horizontal plane with the first timber, and having its ends vertically slidable in guides on the frame, ropes attached to each end of said timbers and extending upwardly over pulleys disposed transversely of the frame, the pairs of ropes at each end of the chute connecting with a separate block, guide-blocks at top and bottom of the frame, a rope running through said guide-blocks and connecting the two first-named blocks and connections with a source of power whereby the chute may be adjusted vertically substantially as described.

709,610. BRUSH. Joseph Schreiner, Irvington, N. J., assignor to Rubber and Celluloid Harness Trimming Co., a Corporation of New Jersey. Filed Nov. 20, 1901. Serial No. 82,961. (No model.)

Claim.—1. A brush, comprising, a handle having a butt, a knot or bunch of bristles arranged against the said butt, said butt being provided with a slot or saw-cut, arranged to allow for a contraction of the said butt toward the center when moist, substantially as and for the purposes set forth.

2. A brush, comprising, a handle having a butt, and an annular groove in said handle, a knot or bunch of bristles arranged against the said butt, a ferrule surrounding the said knot or bunch of bristles provided with an internal shoulder extending into said groove, and the butt of said handle, and said butt being provided with a slot or saw-cut, arranged to allow for a contraction of said butt toward the center when moist, substantially as and for the purposes set forth.

709,611. SECONDARY BATTERY. William L. Silvey, Dayton, Ohio. Filed Feb. 6, 1902. Serial No. 93,173. (No model.)



Claim.—1. In a secondary battery the combination of a battery-plate having supporting-ears with a lug on one of the ears, a bolt passing through the lug and provided with a screw-thread, a nut for clamping the bolt to the lug, an equalizing-bar, the bolt extending into the equalizing-bar and nuts for clamping the equalizing-bar and the bolt together independent of the lug as set forth.

2. In a secondary battery, the combination of two battery-plates having supporting-ears, a lug on the ear of each plate, an equalizing-bar between the ears, and bolts passing through the lugs and equalizing-bar, and nuts for clamping the lugs and equalizing-bar to the bolts, as set forth.

3. In a secondary battery, the combination of a battery-plate having supporting-ears, a lug on one of the ears, support-plates on which the battery-plates are borne by means of the ears and an equalizing-bar, a battery-bolt and nuts, the bolt clamped to the lug and the equalizing-bar by means of the nuts as set forth.

4. In a secondary battery, the combination of a battery-plate having ears for the support of the plate, a lug on one of the ears, the lug having a hole in it, a screw-threaded rod in the hole, an equalizing-bar with a hole in it, the rod extending from the lug on the plate to the equalizing-bar and means for clamping the rod to the lug on the plate and the equalizing-bar as set forth.

5. In a secondary battery, the combination with the battery-plate of supporting hanger-ears for the plate, one of the ears having a lug, the lug having a hole in it and an equalizing-bar, the bar connected to the lug on the plate by means of a rod extending from the lug on the plate to the equalizing-bar as set forth.

6. In a secondary battery, the combination with the body of the plate of ears at the top of the plate, the ears having hooks for supporting the plate, a lug on one of the ears, the lug having a receptacle in it and a screw-threaded rod and equalizing-bar, the equalizing-bar and lug on the plate connected together through the intermediate screw-threaded rod, as set forth.

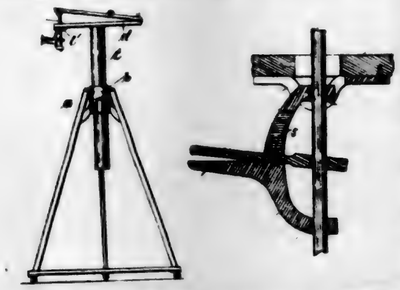
7. In a secondary battery, the combination with the body of the plate A of hanger-ears, a hook on one of the hangers, a lug on one of the ears, a hole in the lug, a rod and connecting-bar the rod extending from the lug to the connecting-bar and plates for supporting the plate A and a battery jar or cell for supporting the battery-plates and battery-plate supports as set forth.

8. In a secondary battery, the combination of a battery-plate, hangers on the plate, ears on the hangers, a lug on one of the ears, an equalizing and distributing bar E and a rod F, the rod extending from the equalizing-bar to the lug and clamps for maintaining the lug and the rod and the rod and equalizing-bar in close metallic contact, as set forth.

9. In a secondary battery, the combination of an equalizing and distributing bar E bolt F, nuts F^2 with a battery-plate, the plate having hangers, ears on the hangers, a lug on one of the ears, the bolt F extending from the lug to the equalizing-bar, the nuts clamping the bar to one end of the bolt, the other end of the bolt clamped to the lug on the battery-plate, as set forth.

10. In a secondary battery, the combination of an equalizing and distributing bar E bolt F nuts F^2 with a battery-plate, the plate having hangers, ears attached to the hangers, a lug on one of the ears, the bolt extending from the lugs to the equalizing-bar, the nuts clamping the bar to one end of the bolt, the other end of the bolt being clamped to the lug on the battery-plate, as set forth.

709,612. ADJUSTABLE CAMERA-STAND. James H. Smyth, Chicago, Ill. Filed Feb. 20, 1902. Serial No. 94,942. (No model.)



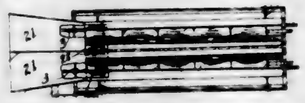
Claim.—1. The combination of a stationary support, a vertically-movable supporting-rod, a hand-lever having diverging branches provided with bores therein through which said supporting-rod is loosely passed, means for pivoting said lever to said stationary support, and a gravity clamping member arranged to rest pivotally upon said lever adjacent to said rod, the same being interposed between the branches of said lever and having a bore therein to receive said supporting-rod.

2. The combination with an adjustable supporting-rod of an element supported thereby, a hand-lever having diverging branches bored at the ends to receive said supporting-rod, one of said branches being pivotally mounted upon a stationary support, and a gravity clamping member pivoted upon said hand-lever, said clamping member being provided with a bore to receive said supporting-rod, the normal or clamping position of said member being at an angle to the handle of said lever, whereby the simultaneous pressure in opposite directions upon the two, may serve to release said clamp and to act as a friction-brake upon said rod.

3. The combination with a tilting member hinged at one end, of a supporting-rod loosely depending from the opposite end, a hand-lever having diverging branches bored to receive said supporting-rod, means for pivoting one of said branches to a stationary support and a gravity clamping member pivotally supported by said hand-lever, said clamping member being arranged approximately at right angles to said supporting-rod and provided with a bore to receive the latter; whereby said supporting-rod may be lifted at will or caused to descend gradually by simultaneously pressing said hand-lever upon said rod to produce the requisite friction and releasing said clamping member.

4. A combined clamping device and friction-brake for a vertically-adjustable supporting-rod, consisting of a bifurcated hand-lever having one of its branches pivoted to a stationary support, bores in said branches for the reception of said rod, and a friction clamping member pivoted in a slot in the uppermost branch, said clamping member having a bore therein for the reception of said rod, and being provided with a rear extension arranged to stand normally at an angle to the handle portion of said lever.

709,613. FRUIT-GRADER. Fred Stebler, Riverside, Cal. Filed July 5, 1901. Serial No. 67,235. (No model.)



Claim.—1. A fruit grader or sizer provided with a frame, yielding supporting-tubes, conveyers, said conveyers and tubes diverging from each other and means for operating the conveyers.

2. A fruit grader or sizer provided with a frame, yielding supporting devices, conveyers diverging therefrom and means for operating the conveyers.

3. A fruit grader or sizer provided with a frame, constructed to receive and discharge the fruit, laterally-yielding supporting-tubes, conveyers diverging therefrom and imparting a rotary motion to the fruit, and means for operating the conveyers.

4. A fruit grader or sizer provided with a frame constructed to receive and discharge the fruit, laterally-yielding tubes disposed longitudinally thereof, conveyers arranged at unequal distances therefrom and constructed to impart a rotary motion to the fruit, sheaves for the conveyers and means for operating the sheaves.

5. A fruit grader or sizer provided with a frame constructed to receive and discharge the fruit, pneumatic tubes therein, sheaves mounted in the frame, conveyers passing over said sheaves and arranged at unequal distances from said tubes and means for operating said sheaves.

6. A fruit grader or sizer provided with a frame, adjustable guides to rotate the fruit thereon, conveyers in said guides, sheaves carrying said conveyers, pneumatic tubes diverging from the latter, and means for operating said sheaves.

7. A fruit grader or sizer provided with a frame, guide-plates thereon having a longitudinal groove, endless conveyers traveling in said groove, means for adjusting the guide-plates and means for operating said conveyers.

8. A fruit grader or sizer provided with a frame, guide-plates thereon, conveyers traveling in said plates, supports upon the said frame, screw-threaded rods connected with said plates and having screw-thread connections with said supports to effect the adjustment of the latter to and from an intermediate yieldable supporting-surface and means for operating the conveyers.

9. A fruit grader or sizer provided with a frame, sheave-wheels mounted in the opposite ends thereof, an endless conveyer passing over said wheels, the shaft carrying one set of wheels carrying a crank-arm, a rocking lever, a rod or link connected to said crank and arm and a treadle connected with said lever, whereby the conveyers may be operated.

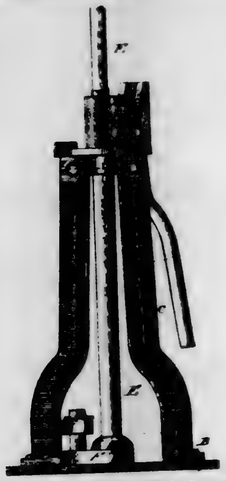
709,614. SWITCH-STAND. Axel A. Strom, Chicago, Ill., assignor to Strom Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed July 15, 1902. Serial No. 115,716. (No model.)

Claim.—1. In a switch-stand, the combination with a bed-plate, of the frame formed of structural metal of the character described, having formed upon one end, integral therewith, a base B provided with openings through which to secure the frame to the bed-plate.

2. In a switch-stand, the combination with a bed-plate, of the frame formed of structural-metal bars of the character described, each bar having formed upon one end integral with it, a base B provided with openings through which to secure it to the bed-plate.

3. In a switch-stand, the combination with a bed-plate, of the frame formed of structural-metal bars of the character described, each bar having formed upon one end, integral with it, a base B provided with openings through which to secure it to the bed-plate, and a table having depending ears through which it is fastened to webs of said bars.

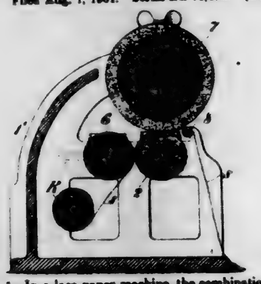
4. In a switch-stand, the combination of the rotary spindle provided with a crank on its lower end and having in said lower end a socket, and a bed-plate having a journaling-stud projecting into said socket sufficiently far to bring said stud and the crank into the same horizontal plane, substantially as and for the purpose set forth.



5. In a switch-stand, the combination with its frame, its rotary spindle provided with a crank and the table surmounting the frame, of a yoke embracing and secured to the spindle above the table and open between its ends to form an unobstructed space between the extremity of the extended end of the yoke and the side of the spindle facing it, and an operating-lever fulcrumed between the sides of said yoke in said extended end and working at its shorter arm in said space, substantially as and for the purpose set forth.

6. In a switch-stand, the combination with its frame and the table surmounting it, of a rotary crank-carrying spindle projecting through said table and flat-sided above the same, a yoke embracing and secured to the flat-sided section of the spindle and open between its ends to form an unobstructed space between the extremity of the extended end of the yoke and the side of the spindle facing it, and an operating-lever fulcrumed between the sides of the yoke in said extended end and working at its shorter arm in said space, substantially as and for the purpose set forth.

709,615. **LACE-PAPER MACHINE.** JOHN R. THOMPSON, Brooklyn, N. Y. Filed Aug. 7, 1901. Serial No. 71,152. (No model.)

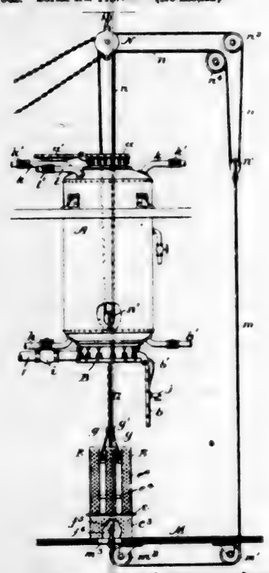


Claim.—1. In a lace-paper machine, the combination with the die-roll, having on its face projecting cutters and surfaces in relief for embossing, of the cutting-roll in peripheral contact with the die-roll on the side where the strip of paper enters, and the embossing-roll of yielding material bearing on the top of the die-roll, of guiding means, at the point where the strip emerges from the bite of the die-roll and embossing-roll, said guiding means adapted to support the strip of paper while the cutters are drawing out the same, and then permit the strip to fall away from the embossing-roll, whereby the moving strip of lace-paper is freed from the rolls without parting, substantially as set forth.

2. In a machine for producing a continuous strip of lace-paper, the combination with a die-roll having on its face cutters 4 and embossing, relief-surfaces, 5, a cutting-roll 6, and an embossing-roll 7, with a yielding surface, situated over the die-roll, of a transverse guide parallel with the roll-axes and situated a little above a horizontal plane passing through the bite of the rolls 2 and 7, near the point of discharge of the lace-paper strip, the latter passing out over said guide and being relieved thereby successively from the cutters on the die-roll and the embossing-recesses in the roll 7, substantially as set forth.

3. The combination with the die-roll 2, having cutters 4 and relief-surfaces 5 on its face, the cutting-roll 6, in peripheral contact with the die-roll where the strip of paper enters, the yielding embossing-roll 7, situated above the die-roll and in embossing contact therewith, and the guide 8, in the form of a roller, said guide having its axis substantially parallel with the roll-axes and its upper surface slightly above the horizontal plane through the embossing-point, substantially as set forth.

709,616. **APPARATUS FOR THE TREATMENT OF GARBAGE OR SIMILAR MATERIAL.** ROOSIER THORNE, Greenwich, Conn. Filed June 30, 1902. Serial No. 113,762. (No model.)



Claim.—1. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle provided with a perforated false bottom, one or more drainage-conduits projecting upwardly from said bottom and affording a channel or channels for the drainage of liquids, and means whereby said conduits may be lowered below the working plane of said perforated bottom.

2. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle provided with a perforated false bottom, a discharge-port in the bottom of said receptacle, one or more drainage-conduits, projecting upwardly from said false bottom and affording one or more channels for the drainage of liquids, and means for lowering said conduit or conduits through said opening.

3. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle provided with a discharge-port at its lower end, one or more drainage-conduits affording a channel or channels for the drainage of liquids, a perforated support for said conduits, and means whereby said conduits and support may be lowered through said discharge-port and replaced for service.

4. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle provided with a discharge-port at its lower end, a removable perforated false bottom, one or more drainage-conduits attached to and supported thereby and means for lowering said false bottom and conduits through said discharge-port.

5. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle provided with a discharge-port in the bottom thereof, a perforated support in said receptacle, one or more drainage-conduits removably attached to and supported by said support, and means for lowering said support and conduits through said discharge-port, for the purpose set forth.

6. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle having a removable bottom, a perforated false bottom or support normally supported by said removable bottom, and one or more drainage-conduits supported by said perforated support and affording one or more channels for the drainage of liquids.

7. In an apparatus for the treatment of garbage or similar material, the combination substantially as hereinbefore described, of a tank or receptacle having a discharge-port in the bottom thereof, a perforated support in said receptacle, drainage-conduits consisting of a series of perforated tubes connected together and removably attached to said perforated support, and means for lowering said support and conduits through said discharge-port and replacing them for service.

709,617. **METALLIC FENCE-POST.** JOSEPH A. UTTER, Crawfordsville, Ind., assignor to John F. Utter, San Francisco, Cal. Filed Jan. 24, 1902. Serial No. 91,054. (No model.)

Claim.—1. The combination in a metallic fence-post of a cement base having embedded therein a pair of upright parallel metallic bars secured together at the top, adjustable clamps having slotted arms embracing the outer sides of the bars, latch-bolts passing between the inner separated sides of the bars and through the clamps, and nuts securing said bolts.

2. In a metallic fence-post, the combination of a cement base, a pair of upright bars embedded in said base and having smooth surfaces, a substantially U-shaped clamp embracing the exterior of both bars and having its broad base bearing against the edges of the bars, and having its arms adapted to receive a line-wire, and means for holding the clamp to the bars.

3. The combination of an inseparable base; spaced upright bars fixed therein; a metallic clamp having a broad back and slotted parallel arms said arms embracing the outer sides of the bars and said back having a hole through it; a latch-bolt passing between the inner faces of the bars and having an end extending through the back of the clamp; and means for securing said end said clamp having means at the opposite end to engage a fence-wire.

4. In a metallic fence-post for wire fence the combination of a cement base having a metallic band around its top or embedded therein and a metallic core, and upright bars fixed in said base, the upper end of said core being attached to said upright bars and the lower end of said core attached to a weight near the bottom of said base substantially as described.

5. In a metallic fence-post, the combination of a cement base having a flange, a pair of parallel and spaced upright bars fixed in said base, said base having a metallic band embedded in it near its top, U-shaped clamps embracing the outside of the upright bars and having means for receiving the line-wire; and a bolt passing through the space between the pair of upright bars, and also through the back of the clamp, and having a hook end to engage the portion of wire between the pair of bars, and a means for securing the bolt.

6. The combination in a fence of substantially parallel and separated vertical bars, a cement base in which they are fixed, a cap-piece with a tongue interposed to hold the bars apart, wire-holding clamps inclosing the bars with the backs across their rear edges and slots for the wires in the front ends of the clamps, bolts having hooks to engage the wires between the arms of the clamps, screw-threaded rear ends passing through the backs of the clamps and nuts fitting thereon, the shanks of said bolts acting as braces at intervals between the post-sections.

709,618. **HINGE-KNOB.** HARRY J. VALENTINE, Hempstead, N. Y., assignor to the Columbian Hardware Company, Cleveland, Ohio, a Corporation of Ohio. Filed Apr. 21, 1902. Serial No. 103,891. (No model.)

Claim.—1. The combination, with a hinge having a socket or knuckle, of a hinge-knob, composed of an outer sheet-metal section, and a cylindrical inner sheet-metal section, said outer section having an enlarged rim and said inner section having a rim fitted firmly in the enlarged rim and being provided with a square shoulder at the joint adjoining its cylindrical surface, the said rims combined being the thickness of the socket or knuckle, and the shoulder being less than such thickness and resting and turning upon the end of the socket or knuckle, substantially as set forth.

2. A sheet-metal hinge-knob, comprising in its construction two hollow sections each closed, or substantially closed, at one end and so constructed and joined at their open ends as to form an internal annular shoulder, and an annular core-disk seated on said shoulder, substantially as set forth.

3. A sheet-metal hinge-knob, comprising in its construction two hollow sections each closed, or substantially closed, at one end and so constructed and joined at their open ends as to form an enlarged annular chamber, and an annular core-disk seated and filling in said chamber, substantially as set forth.

4. A hinge-knob, composed of an outer sheet-metal section having an annular shoulder at its juncture with its rim, and an inner sheet-metal section having an annular shoulder, the rim of said inner section resting firmly against the shoulder of the outer section, and a core confined between the shoulders, substantially as set forth.

5. A sheet-metal hinge-knob provided with a series of keeper-holes, in combination with a fixed core therein, reinforcing the weaker perforated portion of the knob, substantially as described.

6. A sheet-metal hinge-knob provided with a series of keeper-holes, in combination with a fixed transverse core-disk provided with holes registering with the other holes, and reinforcing the weaker perforated portion of the knob, substantially as described.

709,619. **IMPLEMENT-SEAT.** JOHN G. WAGGERIN, Springfield, Minn. Filed Mar. 26, 1902. Serial No. 99,961. (No model.)

Claim.—In an implement-seat, the combination of the angular supporting-post 10 secured at its lower end to an implement, of the hinge member 16 attached to the upper end of the post 10 by a bolt, of the member 15 hinged to the member 16 carrying on its rear end the cross-bar 20, of the seat 12 secured to the member 15 and the bar 20, of the cross-bar 18 secured to the rear end of the member 16 at right angles thereto and carrying the coil-springs 14' and 14'' on its outer ends, all substantially as shown and described and for the purposes specified.

709,620. WOVEN FEATHER FABRIC. EDWARD K. WARREN and JONAS H. HOLDEN, Threesaks, Mich. Filed Nov. 21, 1900. Serial No. 737,328. (No specimens.)

Claim.—1. A fabric made up of strands formed of feathers wrapped upon a longitudinal fibrous strand by a wrapping-thread, as specified.

2. A fabric containing in its warp or weft, strands made up of down or feathers wrapped upon a longitudinal strand by wrapping-thread as specified.

3. A strand for use in making fabrics formed out of down or feathers secured upon a longitudinal fibrous strand by a wrapping-thread, as specified.

4. A fabric made up of strands formed of downy material wrapped upon a longitudinal fibrous strand by a wrapping-thread, as specified.

5. A fabric containing in its warp or weft, strands made up of downy material wrapped upon a longitudinal strand by wrapping-thread as specified.

6. A strand for use in making fabrics formed out of downy material secured upon a longitudinal fibrous strand by a wrapping-thread, as specified.

7. A strand for use in making fabrics formed from down or plumage of feathers retained by a wrapping-thread having its coils close together so as to embrace the same to compact the said down or plumage into a firm strand, as specified.

709,621. WOVEN FEATHER FABRIC. EDWARD K. WARREN and JONAS H. HOLDEN, Threesaks, Mich. Filed Nov. 21, 1900. Serial No. 737,329. (No specimens.)

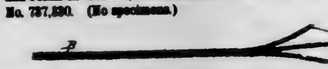
Claim.—1. A fabric made up of strands formed of down or plumage of feathers closely compacted together.

2. A fabric containing in its warp or weft, strands made up of down and plumage of feathers felted together.

3. A strand for use in making fabrics formed out of feathers suitably collected and closely compacted together.

4. A strand for use in making fabrics formed out of feathers felted together.

709,622. WOVEN FEATHER FABRIC. EDWARD K. WARREN and JONAS H. HOLDEN, Threesaks, Mich. Filed Nov. 21, 1900. Serial No. 737,330. (No specimens.)

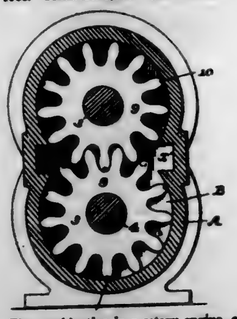


Claim.—1. A fabric made up of strands of feathers and other retaining fibers twisted together into close compact strands as specified.

2. A fabric containing in its warp or weft, strands made up of feathers and other fibers incorporated and twisted together into close compact strands, as specified.

3. A strand for use in making fabrics formed out of feathers twisted together into close compact strands, as specified.

709,623. ROTARY ENGINE. SAMUEL J. WIRE, Minden, La. Filed Feb. 2, 1900. Serial No. 3,730. (No model.)



Claim.—1. The combination in a rotary engine, of parallel shafts, each carrying a plurality of piston-wheels with radial blades, a casing partitions containing valve-chambers and valves extending across the casing between the wheels, and ports arranged to conduct the exhaust-steam from one pair of wheels to position to act upon the next pair, substantially as set forth.

2. The combination of the casing, partitions, piston-wheels provided with blades, chambers *x x'*, and ports and channels in the partitions affording communication between the chamber *x* at one side of each partition and the chamber *x'* at the other side, substantially as set forth.

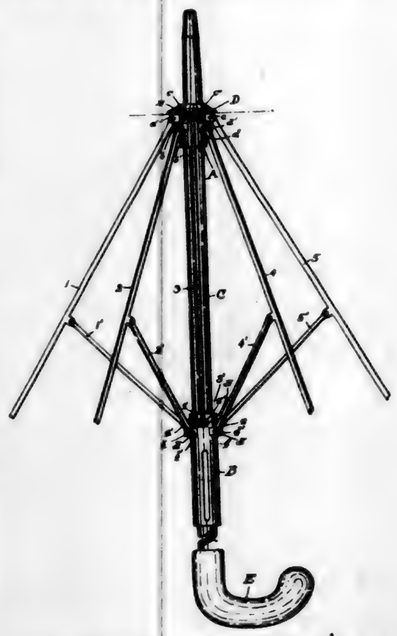
3. The combination of the casing, parallel shafts, piston-wheels and intermediate partitions with chambers, and ports in the said partitions and valves controlling said ports, whereby the direction of steam passing through the partitions may be reversed, substantially as set forth.

4. The combination of the casing, parallel shafts carrying pairs of piston-wheels, rotating with but sliding on the shaft, and movable partitions provided with channels, ports and valves, substantially as set forth.

5. The combination of the casing, shafts, piston-wheels, partitions provided with chambers, ports and valves, and a rock-shaft outside the casing, and connections between the latter and the said valves, substantially as set forth.

6. The combination of the casing, shafts, piston-wheels, sliding partitions provided with channels, ports and valves, a rock-shaft outside of the casing, valve-stems connected therewith, and flexible connections between the valve-stems and the valves of the movable partitions, substantially as described.

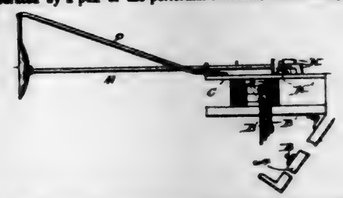
709,624. UMBRELLA. EARL M. ZENN, Marion, Ind. Filed Jan. 11, 1902. Serial No. 89,339. (No model.)



Claim.—In an umbrella, the combination with the pole, of a band rigidly affixed thereto at one end thereof, a series of ears arranged on the periphery of the band, with a second series of ears arranged below said first-named series and out of vertical alinement therewith, the lower series extending outwardly beyond the upper series, a washer seated on the upper end of said band and having its upper face beveled and its edge extending beyond the said ears, a band slidably mounted on the pole and carrying an upper and a lower series of ears out of vertical alinement, ribs secured in the upper series of ears of the stationary band and carrying braces secured in the upper series of ears of the sliding band, with ribs secured in the lower series of ears of the stationary band and carrying braces secured in the lower series of ears of the sliding band, substantially as described.

709,625. MUSIC-LEAF TURNER. JAMES AKERS, Washington, D. C. Filed Feb. 15, 1902. Serial No. 94,312. (No model.)

Claim.—1. In a music-leaf turner, the combination with a spring-pressed arm for turning the sheet and a detent for holding said arm in its set position with the spring under tension, of a releasing device for said detent embodying a wing or vane freely suspended in position and adapted to be operated by a puff of the performer's breath; substantially as described.



2. In a music-leaf turner, the combination with a spring-pressed arm for turning the sheet and a detent for holding said arm in its set position with the spring under tension, of a pusher for releasing said detent and a wing or vane connected with said pusher with means for supporting said wing or vane in front of the arm and in position to be operated by a puff of the performer's breath; substantially as described.

3. In a music-leaf turner, the combination with a spring-pressed arm and a detent for holding said arm in its set position with the spring under tension, of a releasing-pusher for said detent, a wing or vane connected therewith and adapted to be operated by a puff of the performer's breath and a support for said wing or vane extending over the path of travel of the spring-pressed arm in turning a leaf; substantially as described.

4. In a music-leaf turner, the combination with a spring-pressed arm and a detent for holding said arm in its set position with the spring under tension, of a pusher for releasing said detent and a freely-suspended wing or vane having a concave face, connected with said pusher and supported in position and adapted to be operated by a puff of the performer's breath; substantially as described.

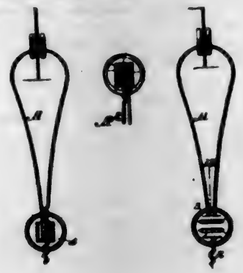
5. In a music-leaf turner, the combination with a support, a spring-pressed arm mounted thereon and a detent for holding said arm in its set position with its spring under tension, of a longitudinally-movable rod carried by said support and extending out over the path of travel of the arm, a detent-releasing device connected with the inner end of the rod and a wing or vane connected with the outer end of the rod and adapted to be moved by a puff of the performer's breath to release the detent and allow the arm to swing; substantially as described.

6. In a music-leaf turner, the combination with a plurality of independent spring-pressed arms, detents for holding said arms in set position with the springs under tension, and a pusher for releasing said detents, of pusher-stops moved by the arms and adapted to arrest said pusher when an arm is released and to be moved out of the path of said pusher by the movement of the released arm; substantially as described.

7. In a music-leaf turner the combination with a series of spring-pressed arms having detent-shoulders, a series of detents coöperating with said shoulders to hold the arms in set position with the springs under tension and a pusher coöperating with said detents successively of independent detent-stops moving with the arms each coöperating with the pusher to arrest its movement when an arm is released and itself moved out of the path of the pusher by the released arm; substantially as described.

8. In a music-leaf turner, the combination with a pivoted spring-pressed arm, a detent therefor and a releasing mechanism for said detent, of leaf-clamping fingers pivotally mounted on the end of said arm whereby a leaf may be turned by said arm when the axis of the leaf and arm are out of alinement; substantially as described.

709,626. SEAL. EDWARD J. BROWN, East Orange, N. J. Filed May 26, 1902. Serial No. 108,269. (No model.)



Claim.—1. An improved seal composed of a flexible shackle of wire having one end provided with fakes transverse to its length in the plane of the body of the shackle, and a two-part seal-disk of sheet metal having a socket-forming raised portion originally adapted to receive such faked end of the shackle and wire and depressed at its sides upon such faked end to retain it, the narrower socket so formed being adapted to receive the outer end of the shackle and to be depressed upon such outer end to fasten the seal.

2. An improved seal composed of a flexible shackle of wire having one end provided with fakes transverse to its length in the plane of the body of the shackle, and an outer end of zigzag shape, and a two-part seal-disk of sheet metal having a socket-forming raised portion originally adapted to receive such faked end of the shackle endwise and depressed at its sides upon such faked end to retain it, the narrower socket so formed being adapted to receive the outer end of the shackle and to be depressed upon such outer end to fasten the seal.

3. An improved seal composed of a flexible shackle of wire having one end provided with fakes transverse to its length in the plane of the body of the shackle, and an outer end of zigzag shape, and a sheet-metal seal-disk composed of two parts constructed respectively with a marginal joint-forming flange and with a raised portion forming an open-ended socket; such socket having the faked end of the shackle fastened therein and constructed to receive the zigzag shackle end and to locate said zigzag end across the fakes of said faked end, preliminary to fastening the seal by a seal-press, substantially as hereinbefore specified.

709,627. SAWMILL LOG-REFLECTOR. WILLIAM T. S. DODDRIDGE, Centralia, W. Va., assignor of one-half to Artemus F. Holden, Centralia, W. Va. Filed Mar. 20, 1902. Serial No. 100,598. (No model.)

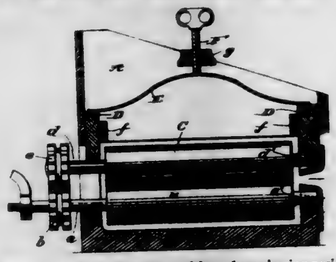
Claim.—1. In a sawmill log-reflector, the combination of a track, a carriage movable upon the track, a reflector located adjacent to the said track and in the rear of the carriage, adjustable devices adapted for securing the said reflector in inclined positions, mechanism constructed and arranged to support the said reflector rotatively about a vertical axis, and releasable means for securing the reflector-supporting mechanism in different rotational positions.

2. In a sawmill log-reflector, the combination of a track, a carriage movable upon the track, a reflector, reflector-supports adjustable vertically and rotatively about a vertical axis, releasable means for securing the said reflector-supports in different rotational positions, adjustable devices adapted for securing the reflector in inclined positions, a reflector-cleaner, mechanism adapted to actuate the said reflector-cleaner, and attachments borne by the carriage and constructed and arranged to operate the said cleaner mechanism.

3. In a sawmill log-reflector, the combination of the carriage-track, a movable carriage, an adjustable reflector, devices for adjusting the re-

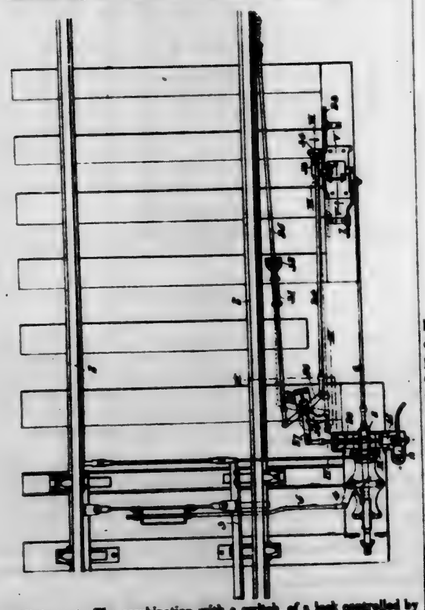
flector with respect to the end of a leg borne by the carriage, a reflector-cleaner, mechanism constructed and arranged to actuate the said reflector-cleaner, the said mechanism including a slide-rod, a spring-supported foot-rod borne by the carriage and adapted when depressed to be brought into contact with the slide-rod by movement of the carriage, and means for returning the slide-rod after its displacement by the foot-rod, substantially as described.

709,628. CLOTHES-WRINGER. ELBER B. GAY, Woonsocket, R. I. Filed Jan. 2, 1902. Serial No. 88,118. (No model.)



Claim.—A clothes-wringer comprising a frame having upright ends, one of which is made up of a lower portion and an upper portion separated by a way or opening which extends throughout its width, guides on the upper portions of the frame ends, a lower roll having trunnions journaled in the lower portions of the frame ends, spring-pressed, slidable bearings arranged in the guides on the upper portions of the frame ends, an upper roll having trunnions journaled in said bearings, a guard connected to the lower portion of the sectional frame end and resting over one trunnion of the lower roll and having an upper convex face, a guard connected to and movable with one slide-bearing and resting below one trunnion of the upper roll, and having a convex lower face, and gearing connecting the rolls whereby power applied to one will turn both.

709,629. AUTOMATIC SWITCH-LOCK. JOHN R. GILLIES, Jersey City, N. J., assignor to the Union Switch and Signal Company, Swissvale, Pa., a Corporation of Pennsylvania. Filed July 23, 1901. Renewed Aug. 19, 1902. Serial No. 119,914. (No model.)



Claim.—1. The combination with a switch, of a lock controlled by the entrance of a train upon a portion of the track, means for locking the same when the train so enters that portion of the track, unlocking mechanism adapted to be operated by a car in proximity to the switch to unlock therewith, and means adapted to be controlled by a switchman and arranged to put the unlocking mechanism into operative position; substantially as described.

2. The combination with a switch, of a lock controlled by the entrance of a train upon a portion of the track, means for locking the same when the train so enters that portion of the track, unlocking mechanism adapted to be operated by a car in proximity to the switch to restore the lock to its locked position, means adapted to be controlled by a switchman and arranged to put the unlocking mechanism into operative position, and a signal-circuit operated by motion of the last-named means; substantially as described.

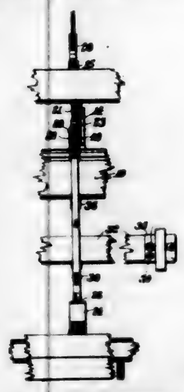
3. The combination with a switch, of a lock controlled by the entrance of a train upon a portion of the track, means for locking the same when the train so enters that portion of the track, unlocking mechanism adapted to be operated by a car in proximity to the switch to unlock therewith, means adapted to be controlled by a switchman and arranged to put the unlocking mechanism into operative position; and a locking device by which said unlocking mechanism when operated by the car is held in unlocking position; substantially as described.

4. The combination of a treadle-bar normally below the level of the rail, mechanism for raising the treadle-bar to a level slightly above the rail, and a switch-lock operated by the treadle-bar; substantially as described.

5. The combination of a treadle-bar normally below the level of the rail, mechanism for raising the treadle-bar to a level slightly above the rail, a spring which resists motion of the treadle-bar and is adapted to resist weights substantially as described.

6. The combination of a treadle-bar normally below the level of the rail, mechanism for raising the treadle-bar to a level slightly above the rail, a lock operated on a depression of the treadle-bar to lock the same in depressed position, and mechanism for releasing said lock; substantially as described.

709,630. PIANOFORTE-ACTION. GEORGE M. GUILD, Cambridge, Mass., assignor to Louise Adams Guild, Cambridge, Mass. Filed Dec. 17, 1901. Serial No. 86,296. (No model.)



Claim.—1. In a piano-action, the combination with a combined lifter-rod and jack extending from the hammer-butt to the key and a downwardly-inclined link pivoted at one end to a support and at its opposite end to the lifter-rod and jack near its lower end, whereby said lower end is thrown outward as it is raised, of a rest or bearing contacting with the rear side of said lifter-rod and jack between its ends and forming a center or fulcrum on which it will turn, whereby a continuous inward movement of its upper end toward the hammer-butt pivot is produced as its lower end is forced outward.

2. In a piano-action, the combination with a combined lifter-rod and jack extending from the hammer-butt to the key, and means whereby the lower end of the lifter-rod and jack is thrown outward as it is raised, of a rest or bearing contacting with the rear side of said lifter-rod and jack between its ends and forming a center or fulcrum on which it will turn, whereby a continuous inward movement of its upper end toward the hammer-butt pivot is produced as its lower end is forced outward, and a throw-off device for producing a sudden withdrawal of the jack from the shoulder of the hammer-butt when the hammer has nearly reached the string.

3. In a piano-action, the combination with a combined lifter-rod and jack extending from the hammer-butt to the key, and means whereby the lower end of the lifter-rod and jack is thrown outward as it is raised, of a rest or bearing contacting with the rear side of said lifter-rod and jack between its ends and forming a center or fulcrum on which it will turn, whereby a continuous inward movement of its upper end toward the hammer-butt pivot is produced as its lower end is forced outward, a throw-off device for producing a sudden withdrawal of the jack from the shoulder of the hammer-butt when the hammer has nearly reached the string, and a back-catch for holding the hammer close to the string.

4. In a piano-action, the combination with a hammer-butt, the latter having the jack-butt formed thereon, of a lifter-rod and jack extending from the key to the jack-butt, a key for actuating said lifter-rod and jack, a hammer-retracting spring connected with the lifter rod and jack, a downwardly-inclined link pivoted at one end to a support and at its opposite end to the lower portion of the lifter-rod and jack, whereby the lower end of the latter is thrown outward as it is raised, a throw-off lever bearing at its front end against the rear side of the lifter-rod and jack and connected therewith by a pin projecting from said lifter-rod and jack into a hole at the front end of the lever, said lever forming a center or fulcrum for the lifter-rod and jack on which it will turn when its lower end is thrown outward, to produce a continuous inward movement of its upper end toward the hammer-butt pivot.

5. In a piano-action, the combination with a lifter-rod and jack provided with a rearwardly-extending pin and a throw-off button, of a throw-off lever provided with an arm adapted to be brought into contact with said said throw-off button, and the front end of said lever forming a rest or fulcrum for said lifter-rod and jack on which it will turn as it rises to operate the hammer, the inner end of said pin during the first part of the upward movement of the lifter-rod and jack taking a bearing against the front end of the throw-off lever to raise the same slowly, and the outer end of said pin when near the termination of its upward movement taking a bearing against said throw-off lever at a point much nearer to its fulcrum, whereby the movement of said lever is accelerated to produce a quick throw-off during the latter part of the stroke of the key.

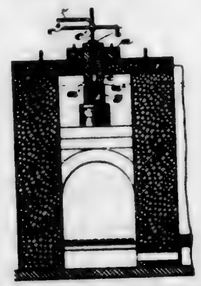
6. In a piano-action, the combination with a lifter-rod and jack extending from the hammer-butt to the key and provided with a rearwardly-extending pin, and a throw-off button beneath the same, and means whereby the lower end of the lifter-rod and jack is thrown outward as it is raised, of a throw-off lever having a downwardly-extending arm adapted to be brought into contact with the throw-off button, said lever bearing at its front end against the rear side of the lifter-rod and jack and forming a center or fulcrum on which the latter will turn as it is raised, and having an aperture at its front end for the free reception of said pin, the inner end of the latter during the first part of the upward movement of the lifter-rod and jack taking a bearing on the lever at the front end of its aperture, and the outer end of said pin when near the end of its upward movement taking a bearing against the upper wall of said aperture at a point much nearer to the fulcrum of the lever to thereby accelerate the movement of the latter and produce a quick throw-off when the key is near the end of its stroke.

7. In a piano-action, the combination with a combined lifter-rod and jack extending from the hammer-butt to the key, of a rest or bearing contacting with the rear side of said lifter-rod and jack between its ends and forming a center or fulcrum thereby on which it will turn, and a downwardly-inclined link pivoted at one end to said lifter-rod and jack and at its opposite end to a support, whereby the lower end of said lifter-rod is thrown outward as it is raised, said support being made adjustable toward and from its bracket to vary the normal distance of the jack from the hammer-pivot in accordance with the dip or stroke of the key.

8. In a piano-action, the combination with a combined lifter-rod and jack extending from the hammer-butt to the key, and a downwardly-inclined link pivoted at one end to a support and at its opposite end to the lifter-rod and jack near its lower end, whereby said lower end is thrown outward as it is raised, of a rest or bearing contacting with the rear side of said lifter-rod and jack between its ends and forming a center or fulcrum on which it will turn, whereby a continuous inward movement of its upper end toward the hammer-pivot is produced as its lower end is forced outward, and a spring for holding said lifter-rod and jack against said rest or fulcrum.

9. In a piano-action, the combination with the hammer-butt, the latter having the jack-butt formed thereon, of a lifter-rod and jack extending from the key to the hammer-butt and provided with a rearwardly-extending pin and a throw-off button beneath the same, a key for actuating said lifter-rod and jack, a hammer-retracting spring connected with the lifter-rod and jack, means whereby the lower end of the lifter-rod and jack is thrown outward as it is raised, a throw-off lever having a downwardly-extending arm adapted to be brought into contact with the throw-off button, said lever bearing at its front end against the rear side of the lifter-rod and jack and forming a fulcrum on which the latter will turn as it is raised, and having an aperture at its front end for the free reception of the pin projecting from the lifter-rod and jack, whereby the throw-off lever is actuated by the lifter-rod and jack, a damper, damper-lever and damper-spring, an arm projecting upwardly from the rear end of the throw-off lever and acting on the damper-lever as the front end of the throw-off lever is raised by the lifter-rod and jack.

709,631. PROCESS OF HARDENING PROJECTILES. ROBERT A. HADFIELD, Sheffield, England. Filed May 17, 1898. Serial No. 680,956. (No specimens.)



Claim.—1. The method of hardening projectiles, which consists in gradually heating the point and shoulder of the projectile to a temperature suitable for hardening; wholly removing it from the action of the heating medium; subsequently cooling the projectile initially from its interior, and finally completely immersing the projectile in a cooling liquid.

2. The method of hardening projectiles, which consists in gradually heating the point and shoulder of the projectile to a bright-red or low-yellow heat, and wholly removing it from the action of the heating medium; thereafter cooling the projectile initially from its interior, and after such internal cooling has begun completely immersing the projectile in a cooling fluid.

3. The method of hardening projectiles, which consists in rotating the projectile and gradually heating the point thereof to a dull red, continuing the heating until the point and shoulder are brought to a temperature suitable for hardening; removing the projectile from the heating medium, and thereafter circulating a cooling medium through the chamber of the projectile, and completely immersing the projectile in a cooling fluid after the internal cooling has been initiated.

4. The method of hardening projectiles, which consists in suspending the projectile, point down, in a furnace, rotating the projectile, and gradually heating the point and shoulder of the same to a hardening temperature while rotating the projectile, and protecting the point thereof from the direct action of the heat, and finally completely immersing the projectile in a cooling medium.

5. A method of hardening projectiles, which consists in raising the temperature of the point and shoulder to a bright-red or low-yellow heat by successive heatings while protecting the point of the projectile from the direct action of the heat; circulating a cooling medium under pressure through the chamber of the projectile after removal of the same from the heating medium; withdrawing the protection from the point of the projectile, and completely immersing the latter in a cooling medium after internal cooling and hardening has begun.

6. The method of hardening projectiles, which consists in raising the temperature of the point and shoulder to a bright-red or low-yellow heat by successive heatings, while protecting the point from the direct action of the heat; thereafter circulating a cooling medium under pressure and at a temperature of about 60° Fahrenheit through the chamber of the projectile, beginning before and continuing throughout the immersion, and completely immersing the projectile in a cooling liquid having a temperature of about 80° Fahrenheit until the projectile is quite cool.

7. The method of hardening chambered projectiles, which consists in rotating the projectile, suspended, point downward, in a furnace, and gradually heating the point and shoulder to a hardening temperature while protecting the point from the direct action of the heat; removing the projectile from the furnace to a hardening-tank; circulating a cooling medium under high pressure through the chamber of the projectile after its removal from the furnace, and completely immersing the projectile in a cooling medium in the tank.

709,632. GAME APPARATUS. HENRY A. HARRIS, Cassadaga, N. Y. Filed Dec. 5, 1901. Serial No. 84,734. (No model.)

Claim.—1. A game apparatus consisting of a box provided with a permanently-attached bottom plate, a plate attached to the rim of the

box below the top thereof and forming a compartment under said plate, a tortuous main path upon the said plate, ports through said plate disposed with by-paths between the ports and wall of the main path, an aperture in said plate separate from the ports, a lever pivotally supported in the aforesaid compartment and having one end directly under one of the ports, a figure carried on the opposite end of said lever in range with the aforesaid aperture, a ball propelled in the main path and adapted to drop through the ports, and an opening in the aforesaid compartment for expulsion of the dropped ball as set forth.

2. A game apparatus consisting of a plate, a main path disposed spirally upon said plate, ports distributed longitudinally of said path and disposed with by-paths between the ports and wall of the main path, an aperture in the plate beyond said ports, a figure normally concealed under the plate and movable to exposure through said aperture, and a weight propelled in the main path by manipulation of the plate and adapted to enter the ports and throw the concealed figure into the aforesaid exposure as set forth.

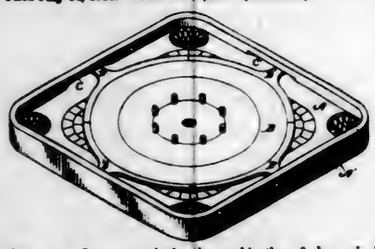
3. A game apparatus consisting of a plate, a main path upon said plate, ports through the plate within the said main path and disposed with by-paths between the ports and walls of the main path, an aperture in the plate, a vertically-oscillatory lever pivotally supported beneath the plate and disposed with one of its ends directly under one of the ports, a figure projecting upward from the opposite end of said lever in range with the aforesaid aperture, and a ball propelled in the paths by manipulation of the plate and adapted to enter the ports as set forth.

4. A game apparatus consisting of a plate, a main path upon said plate, ports through the plate within said path and disposed with by-paths between them and the walls of the main path, an inclosure upon the plate separated from the aforesaid paths, apertures in the plate within said inclosure, levers pivotally supported beneath the plate and each disposed with one end directly under one of the ports, figures on the opposite ends of the levers and in range with the apertures in the inclosure, and a ball propelled in the main path by manipulation of the plate and adapted to pass through the ports and to depress the underlying end of one of the aforesaid levers as set forth.

5. A game apparatus consisting of a plate, a main path upon said plate, ports through the plate within said path and disposed with by-paths at their sides, an inclosure upon the plate separated from said paths, apertures in the plate within the inclosure, a stationary post beneath said plate, levers pivoted to the sides of said post, a spring pressing the levers into frictional contact with the post, each of said levers disposed with one of its ends directly under one of the ports, figures carried on the opposite ends of the levers in range with the apertures in the inclosure, and a ball propelled in the main path and adapted to pass through the ports and depress the underlying end of one of the levers as set forth.

6. A game apparatus consisting of a plate, a main path upon said plate, ports through the plate within said path and disposed with by-paths at their sides, the end of the main path contracted in width and a discharge-port in said end, an inclosure upon the plate separated from said paths, apertures in the plate within the inclosure, a stationary post beneath said plate, levers pivoted to the sides of said post, a spring pressing the levers into frictional contact with the post, each of said levers disposed with one of its ends directly under one of the ports, figures carried on the opposite ends of the levers in range with the apertures in the inclosure, and a ball propelled in the main path and adapted to pass through the ports and depress the underlying end of one of the levers as set forth.

709,684. GAME-BOARD. HENRY I. HASKELL, Ludington, Mich. Filed July 14, 1900. Serial No. 23,669. (No model.)



Claim.—1. In a game device the combination of the main board A, substantially rectangular in form having a raised rim A' surrounding the same, the said rim containing recesses C at each side just above the surface of the board A; an auxiliary board B having projections or arms B', B', B', B', to project and swing within the recesses C; and pads of felt or suitable material on the under side of the board B and on the ends of the projections B' to prevent the boards rubbing upon each other and to permit the arms B' to be swung into and out of the recesses with ease, whereby the auxiliary board is readily attached and detached, for the purpose specified.

2. In a game device the combination of the main board A, substantially rectangular in form having a raised rim A' surrounding the same, the said rim containing recesses C at each side just above the surface of the board A; an auxiliary board B having projections B', B', B', B', to project and swing within the recesses C; and pads of felt or suitable material on the under side of the board B to prevent the boards rubbing upon each other and to permit the arms B' to be swung into and out of the recesses with ease, whereby the auxiliary board is readily attached and detached, for the purpose specified.

3. In a game device, the combination of a main game-board A', substantially rectangular in form, having a raised rim A'; recesses C in said rim just above the surface of the game-board A; an auxiliary game-board B having projections, or arms, B' adapted to swing into and be engaged by the said recesses, whereby said auxiliary game-board is retained in position and is readily attached and detached from the main board, for the purpose specified.

4. In a game device, the combination of a main game-board having a rim projecting above its surface; inwardly-opening recesses in said rim; an auxiliary game-board having projections adapted to extend into and be engaged by said recesses, whereby said auxiliary game-board is detachably held in position; cushions on the under side surface of said auxiliary board, as specified.

5. In a game device, the combination of a main game-board having a rim projecting above its surface; inwardly-opening recesses in said rim; an auxiliary game-board, adapted to rest on the surface of said main game-board having projections adapted to extend into said recesses, whereby said auxiliary game-board is detachably held in position, as specified.

6. In a game device, the combination of a main game-board; an auxiliary game-board having projecting portions to engage suitable retaining devices on the main game-board; and suitable pads, or cushions, between the main game-board and the auxiliary game-board, as specified.

7. In a game device, the combination of a main game-board; an auxiliary game-board adapted to rest on the surface of said main game-board having projecting portions adapted to engage suitable retaining devices on the main game-board, as specified.

709,685. GAME-BOARD. HENRY I. HASKELL, Ludington, Mich. Filed Feb. 8, 1902. Serial No. 93,314. (No model.)

Claim.—1. As an article of manufacture, a game-board formed of a sheet of metal having a raised portion A, with a central depression A'' and circular grooves *a*, *a*, *a'*, and cross-grooves *b*, formed therein; a trough-like portion A' surrounding said raised portion; and a rim portion B, adapted to receive and retain a suitable deadening-cushion in position to receive the impact of the playing-disks.

2. As an article of manufacture, a game-board formed of a sheet of metal having a raised portion A, with a central depression A''; a trough-like portion A' surrounding said raised portion; and a rim portion B, adapted to receive and retain a suitable deadening-cushion in position to receive the impact of the playing-disks.

709,688. DICE-CUP. HENRY I. HASKELL, Ludington, Mich. Filed Apr. 5, 1900. Serial No. 11,997. (No model.)

Claim.—In a dice cup or box, the construction of the side walls A, suitably hinged together, two of the adjacent corners being notched as at B; a bottom C of a size and shape to closely fit the interior of said box, hinged to the inner wall opposite the said notched corners, and adapted to fold downwardly against the said notches, and retain the walls in position when the box is distended and to fold against the side to permit the box to collapse, all constructed substantially as described and for the purpose specified.

---

3. As an article of manufacture, a game-board formed of a sheet of metal having a raised portion A, with a central depression A'' and circular grooves *a*, *a*, *a'*, and cross-grooves *b*, formed therein; a trough-like portion A' surrounding said raised portion; and a rim portion B, adapted to receive and retain a suitable deadening-cushion.

4. As an article of manufacture, a game-board formed of a sheet of metal having a raised portion A, and circular grooves *a*, *a*, *a'*, and cross-grooves *b*, formed therein; a trough-like portion A' surrounding said raised portion; and a rim portion B, adapted to receive and retain a suitable deadening-cushion.

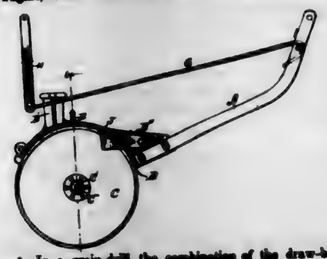
5. As an article of manufacture, a game-board formed of a sheet of metal having a raised portion A, and circular grooves *a*, *a*, *a'*, and cross-grooves *b*, formed therein; a trough like portion A' surrounding said raised portion; and a rim.

6. As an article of manufacture, a game-board formed of sheet metal having a rim portion adapted to receive and retain a deadening-cushion.

709,686. GRAIN-DRILL. WILL F. HOYT, Dowagiac, Mich. Filed Mar. 10, 1900. Serial No. 8,394. (No model.)

Claim.—In a grain-drill, the combination of the shoe B made up of side plates opened outwardly at the heel and curved outwardly at the bottom to open a wide furrow; a boot having a downwardly and rearwardly curved projecting portion A' with a centrally-located fin A'' secured within the shoe so as to divide the stream of grain descending through the boot in substantially equal streams and so distribute it in the bottom of the furrow in double rows, all constructed substantially as described, for the purpose specified.

709,687. GRAIN-DRILL. WILL F. HOYT and DAVID B. SALISBURY, Dowagiac, Mich. Filed Oct. 3, 1901. Serial No. 77,603. (No model.)



Claim.—1. In a grain-drill, the combination of the draw-bars A adapted to be pivoted to the main frame; the bracket B with a boot B' having a flange extension B'' of equal width extending from said boot to the draw-bars; suitable axles carried by said draw-bars projecting at each side forwardly and downwardly; flat disks carried on said axle and beneath the said flange B''; spring-pressure rods connected at their forward ends to the draw-bars and extending rearwardly on each side of the boot B'; and a fork or yoke H connected to the rear ends of the same whereby pressure can be applied to the rear ends of the pressure-rods, all cooperating for the purpose specified.

2. In a grain-drill, the combination of the draw-bars A adapted to be pivoted to the main frame; the bracket B with a boot B' having a flange extension B''; suitable axles carried by said draw-bars projecting at each side forwardly and downwardly; flat disks carried on said axle and beneath the said flange B''; spring-pressure rods connected at their forward ends to the draw-bars and extending rearwardly on each side of the boot B'; and a fork or yoke H connected to the rear ends of the same whereby pressure can be applied to the rear ends of the pressure-rods, all cooperating for the purpose specified.

3. In a grain-drill, the combination of a draw-bar; a suitable bracket with a boot; a disk furrow-opener carried by said bracket; a flange extension on said bracket extending over said furrow-opener; and spring-pressure rods at each side of the boot, adapted to be guided thereby, for the purpose specified.

4. In a grain-drill, the combination of the bracket B, with a transverse aperture therethrough; an axle D with a lug *a* to fit into said transverse aperture; a set-screw for retaining the same in position; an oil-tube E passing down through the bracket to deliver oil into the axle D; flat disks C, C, with hubs fitting onto the opposite ends of said axle and bolt F through the said axle to retain said hubs in position; caps over the ends of said hubs, all cooperating for the purpose specified.

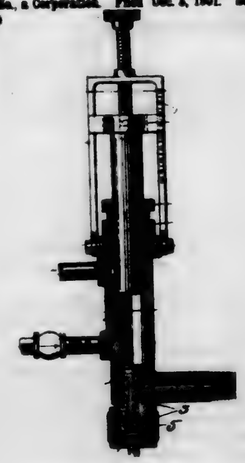
5. In a grain-drill, the combination of the bracket B, with a transverse aperture therethrough; an axle D with a lug *a* to fit into said transverse aperture; a set-screw for retaining the same in position; flat disks C, C, with hubs fitting onto the opposite ends of said axle and bolt F through the said axle to retain said hubs in position; caps over the ends of said hubs, all cooperating for the purpose specified.

6. In a grain-drill, the combination of the bracket B; downwardly and forwardly projecting axles at each side thereof; disks with suitable hubs to revolve on said axle; a boot extending down to the rear of said axle; a scraper *f* below the said axle and between the said disks; and adjustable scrapers I supported on a rearward extension of said bracket to scrape the same toward their peripheries.

7. In a grain-drill, the combination of a bracket; laterally-projecting axles therefrom; disks upon the axles; a flange above said disks; and a scraper secured beneath the flange and extending rearwardly in contact with the exterior of said disks toward their peripheries, for the purpose specified.

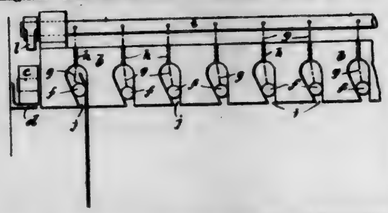
8. In a grain-drill, the combination of the bracket B, with a transverse aperture therethrough; an axle D with a lug *a* to fit into said transverse aperture; suitable means for retaining same in position; flat disks, C, C, with hubs fitting onto the opposite ends of said axle and bolt F through the said axle to retain said hubs in position; caps over the ends of said hubs, all cooperating for the purpose specified.

709,688. GASOLENE-REGULATOR. CHARLES J. JOHNSON, St. Louis, Mo., assignor to CHARLES ROY LOCK & MANUFACTURING COMPANY, St. Louis, Mo., a Corporation. Filed Dec. 3, 1901. Serial No. 84,533. (No model.)



Claim.—The combination of a reservoir, inlet and overflow pipes in communication with said reservoir, an adjustable plunger controlling the capacity of said reservoir, a duct on the side of said reservoir and leading to said overflow-pipe, a valve located at the bottom of said reservoir to reciprocate within the same longitudinally thereof, an outlet-pipe situated beneath said valve, substantially as described.

709,689. APPARATUS FOR CARRYING GOODS THROUGH DRYING-CHAMBERS. JAMES KEITH and WILLIAM W. WARDLE, London, England. Filed Jan. 14, 1902. Serial No. 89,763. (No model.)

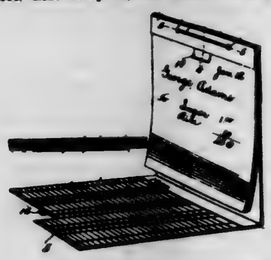


Claim.—1. Apparatus for conveying goods through drying-chambers, comprising in combination, a series of frames or carriages adapted to travel on rails, transverse slotted bars connected to said frames, roller-clips in the slots in said bars for carrying the goods, rock-shafts carried on the slotted bars and connected to said clips so as to raise or lower them, and means for automatically raising the clips to free the goods at the delivery end of the chamber, substantially as described.

2. Means for conveying goods through drying-chambers, consisting of a movable bar or bars each formed with tapered slots on its under side, roller-clips fitted in said slots, a rocking shaft and cords adapted to raise and lower said clips to engage with the goods to be carried through the drying-chamber and to free them at the delivery end, substantially as described.

3. In apparatus for conveying goods through drying-chambers, means for transferring the frames or carriages carrying the goods from one rail or set of rails to another, said means comprising in combination, short movable rails, arms pivoted within the drying-chamber and pivotally jointed to the movable rails for raising and lowering these, and connecting-rods and a hand-lever for operating the pivoted arms, substantially as described.

709,640. FILE. GERHARD H. KRAVIK, Detroit, Minn. Filed Mar. 21, 1900. Renewed Apr. 14, 1901. Serial No. 56,167. (No model.)



Claim.—1. In an accounting system, the combination with a filing-cabinet, of a series of file-wrappers arranged therein, each of said wrappers comprising a pair of leaves hinged together at their bottom edges and provided upon their inner or opposed faces with a ledger-ruled page and a retaining device for loose sales-slips, respectively, means for holding the leaves of each wrapper in closed position, and name-strips extending from the several file-wrappers and disposed alternately at the opposite sides of the cabinet.

2. In an accounting system, the combination with a cabinet, and a series of file-wrappers therein provided with name-strips extended above the wrappers and arranged alternately at opposite sides of the cabinet to leave a vista at the middle of the cabinet between the inner ends of the name-strips, of index-cards arranged within the cabinet and separating the wrappers into alphabetically or otherwise designated groups, reference-tabs formed on the index-cards and displayed within the vista, said filing-wrappers each comprising a pair of hinged leaves, one having a clamp for loose sales-slips or like data, and the other having on its inner face a ledger-ruled page, and means for holding the leaves of each wrapper in closed position to facilitate its removal from and its replacement within the cabinet.

3. An individual file for filing systems comprising a pair of leaves hinged together at one edge, one of said leaves being provided with a holder for loose file-data, and the other leaf being provided with a locking element, and a name strip or tab projecting beyond said element, and a fastener carried by one of the leaves and arranged to engage with the locking element of the opposing leaf.

4. An individual file for filing systems comprising a folded body consisting of front and back leaves hinged together, the front leaf being provided at one end with an inturned hinged clip-flap, and the other leaf being provided at one edge with a projecting catch-tongue, and an elastic fastener engaging with the clip-flap, and also with said catch-tongue, substantially as set forth.

709,641. RAILWAY-TRACK-LAYING MACHINE. HUGH MAIR, Winnipeg, Canada. Filed Aug. 6, 1901. Renewed July 16, 1902. Serial No. 116,537. (No model.)

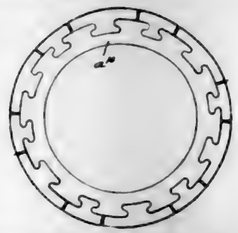
Claim.—1. The combination with the rail-cars and pilot-car and crane, of the uprights and cross-bars and parallel longitudinal girders and inclined girders supported thereby and the rails supported on the girders and the carriages having lower extensions and the blocks and ropes and tongs supported thereby and the rope connecting the carriages as and for the purpose specified.

2. The combination with the rail-cars and pilot-car and crane, of the uprights and cross-bars and parallel longitudinal girders and inclined girders supported thereby and the rails supported on the girders and the carriages having lower extensions and the blocks and ropes and tongs supported thereby and the rope connecting the carriages and a supplemental rope designed to be connected to the rearmost carriage on each rail alternately and a pulley at the upper end of the incline through which each rope extends as and for the purpose specified.

709,642. GRINDING OR CRUSHING HEAD OR ROLL. VOLNEY W. MASON, Jr., New York, N. Y. Filed Dec. 27, 1901. Serial No. 87,453. (No model.)

Claim.—1. A grinding or crushing head or roll composed of a core, and a number of hard, tough yet ductile unmachinable external segments, capable of distortion, secured thereto and disposed relatively to each other to provide very narrow spaces between them, substantially as described.

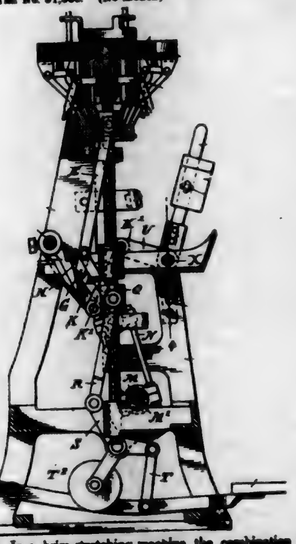
2. A grinding or crushing head or roll composed of a core, or provided with dovetailed grooves and a number of hard, tough yet ductile unmachinable external segments, capable of distortion, formed or provided with dovetailed ribs which enter said grooves, said segments being disposed relatively to each other to provide very narrow spaces between them, substantially as described.



3. A grinding or crushing head or roll composed of a core formed or provided with dovetailed grooves a number of hard, tough yet ductile unmachinable external segments, capable of distortion, formed or provided with dovetailed ribs which enter said grooves, and means for locking said segments to the core, said segments being disposed relatively to each other to provide very narrow spaces between them, substantially as described.

4. A grinding or crushing head composed of a core, a number of distortionable segments secured thereto and disposed relatively to each other with narrow spaces between them, wide enough to provide for distortion of the segments, yet narrow enough to prevent breaking down their adjacent sides, substantially as described.

709,643. HAT-BRIM STRETCHER. EDWARD J. MELLEN, Newark, N. J., assignor to Henry Berg, Orange Valley, N. J. Filed Mar. 13, 1901. Serial No. 51,980. (No model.)

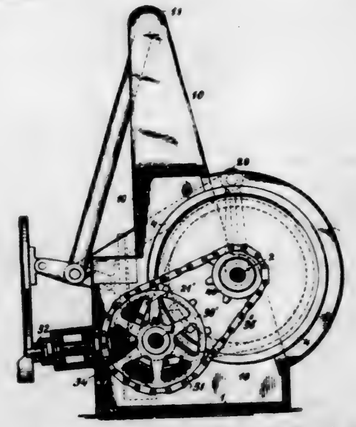


Claim.—1. A brim-stretching machine, the combination of the vibrating stretching and brim-forming mechanism provided with a bearing-surface, a compensating weight, a supporting-lever pivoted in the frame of the machine, an arm upon which the aforesaid bearing travels and connections between said arm and the weighted lever, all adapted to operate substantially as and for the purposes set forth.

2. In a brim-stretching machine, the combination of the vibrating, stretching and brim-forming mechanism provided with a bearing-surface, a compensating weight, a supporting-lever pivoted in the frame of the machine, an arm upon which the aforesaid bearing travels, connections between said arm and the weighted lever, and means for throwing said weighted lever into an inoperative position, as and for the purposes set forth.

709,644. MECHANICAL MOTOR. ROBERT K. MCLAUGHLIN, Rochester, N. Y. Filed Feb. 5, 1902. Serial No. 4,016. (No model.)

Claim.—1. A mechanical motor comprising the combination of: a driving-shaft 2; a fly-wheel surrounding the driving-shaft; bearing-rings fixed in the hub of the fly-wheel; balls in the ball-channels; a sleeve on the driving-shaft within said bearings and fly-wheel, the sleeve being capable of rotating with the driving-shaft; and mechanism to transmit motion from the driving-shaft to the fly-wheel; substantially as described.



2. A mechanical motor comprising the combination of: a driving-shaft 2; a fly-wheel surrounding the driving-shaft; bearing-rings fixed in the hub of the fly-wheel; a sleeve on the driving-shaft within the hub of the fly-wheel, the sleeve being capable of rotating with the driving-shaft; bearing-rings on said sleeve; balls between the bearing-rings fixed in the hub of the wheel and those on the sleeve; and mechanism to transmit motion from the driving-shaft to the fly-wheel; substantially as described.

3. A mechanical motor comprising the combination of: a driving-shaft 2; a fly-wheel surrounding the driving-shaft; bearing-rings fixed in the hub of the fly-wheel; a sleeve on the driving-shaft within the hub of the fly-wheel, the sleeve being capable of rotating with the driving-shaft; means to attach the sleeve to the shaft; bearing-rings on said sleeve; balls between the bearing-rings fixed in the hub of the wheel and those on the shaft; and mechanism to transmit motion from the driving-shaft to the fly-wheel; substantially as described.

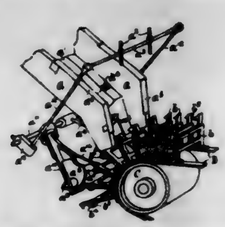
4. A mechanical motor comprising the combination of: a driving-shaft 2; a fly-wheel; ball-bearings confined in the hub of the fly-wheel; a sleeve fitting on the shaft and extending through the hub of the fly-wheel and supporting the bearings; a gear-wheel on the shaft in contact with one end of the sleeve; a projection on the shaft, engaging with the sleeve at the other end thereof; and mechanism for transmitting motion from said gear-wheel to the fly-wheel; substantially as described.

5. A mechanical motor comprising the combination of: a driving-shaft 2; a fly-wheel 4 on said shaft; bearing-rings 41 and 41' fixed in the hub 4' of the fly-wheel; a sleeve 42 within the hub of the fly-wheel; bearing-rings 43 and 43' on said sleeve; balls between the bearing-rings fixed in the hub of the wheel and those on the shaft; a pin 46' in the shaft, fitting in the groove 46 in one end of the sleeve and in the bearing-ring 43'; a stop on the shaft at the other end of the sleeve; a set-screw 44 extending through the bearing-ring 43' over the fluted part 42' of the sleeve; and mechanism for imparting motion to the fly-wheel; substantially as described.

709,645. APPARATUS FOR APPLYING THE PREPARATION TO STRIKING-SURFACES OF MATCH-BOXES, &c. STEPHEN R. PAPILLA, Plumstead, England. Filed Oct. 18, 1901. Serial No. 79,141. (No model.)

Claim.—1. In combination, in apparatus for painting or similarly treating match-boxes or other articles, a chute *a* down which the match-boxes or articles are fed; catch-fingers a^2, a^3 and a catch a^4 arranged in the path of the chute *a* and connected together and simultaneously operated to allow a match-box or article to pass the catch-fingers a^2, a^3, then to be held back by the catch a^4, and finally released from the catch a^4; traveling tapes B, B, provided with double partitions *b b*, *b' b'*, adapted to receive the match-boxes or articles from the chute *a* and to hold them securely for treatment; devices in connection with the traveling tapes B, B and the partitions *b b*, *b' b'* in conjunction with devices for actuating

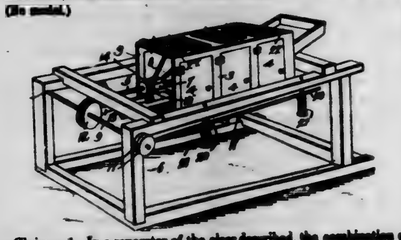
the catch-fingers c^3, c^3, and the catch c^4, substantially as set forth and illustrated.



2. Feed mechanism for apparatus for painting or similarly treating match-boxes or other articles, comprising a chute a; catch-fingers c^3, c^3 and a catch c^4 disposed in the path of the chute a; and devices for effecting the automatic operation of the catch-fingers c^3, c^3 and the catch c^4, consisting of the cam c^7 operated from the apparatus to be fed and carried by a tipping-piece c^5, a shaft c^6 adjacent to the chute a and carrying the tipping-piece c^5, an arm or lever c^{10} upon which the tipping-piece c^5 normally lies, but to which the tipping-piece is not attached, a shaft c^{11} fitted adjacent to the chute a and carrying the arm or lever c^{10} and the catch c^4, links c^{12}, c^{12} carrying the rod c^9 and the fingers c^3, c^3 attached by arms c^{13}, c^{13} to the shaft c^{11}, and springs c^{14}, c^{15}, and c^{16} for insuring the return movements of the parts; all constructed, arranged and adapted for operation substantially as set forth and illustrated.

3. In apparatus for painting or similarly treating match-boxes or other articles, traveling tapes B, B suitably operated and guided, the partitions b b on the traveling tapes B, B and having on their upper portions projections b^2 b^2, and partitions b' b' fitted adjacent to the partitions b b and having bosses b^3 and projecting pins b^4, the pins b^4 successively engaging and rotating a cam c^7 carried by a tipping-piece c^5 operating a shaft c^{11} which is rigidly attached to the catch-fingers c^3, c^3; all arranged, constructed, and adapted for operation substantially as set forth and illustrated.

709,646. BRAN-SEPARATOR. WILLIAM P. PILLSBURY and DAVID ANDERSON, Westerville, N. Y. Filed Mar. 11, 1902. Serial No. 97,734. (No model.)



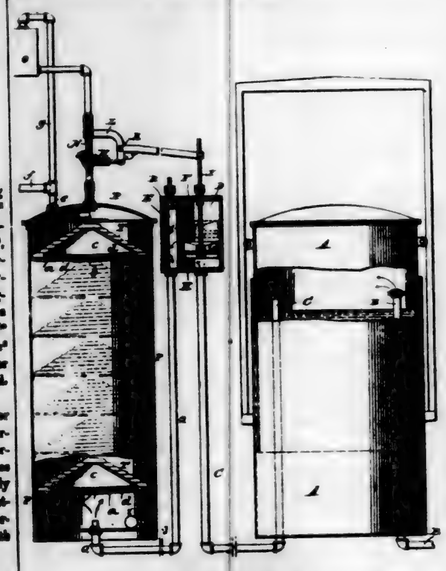
Claim.—1. In a separator of the class described, the combination of a screen-box of polygonal form having screens longitudinally movable independently thereof, a support on which said screen-box is revolubly, means to impart reciprocating motion to the screens of said screen-box, and a yieldably-supported hopper having transverse partitions to bear against the under side of the screen-box, substantially as described.

2. In a separator of the class described, the combination of a supporting and guide bar, a screen-box of polygonal form mounted for longitudinal and revolubly movement on said bar, means to impart reciprocating motion to said screen-box, and a yieldably-supported hopper having partitions to bear against the under side of the screen-box, for the purpose set forth, substantially as described.

3. In a separator of the class described, the combination of a guiding and supporting bar, a screen-box of polygonal form mounted for revolution on said bar, and having certain of its sides formed by screens which are slidably connected thereto, so that said screens may be moved longitudinally independently of the box, means to impart reciprocating motion to the said screens, and a yieldably-supported hopper bearing against the lower side of the revolubly box, substantially as described.

709,647. GARBURETER. ARVIN M. BOSSHARDT, Shelby, Ohio, assignor of one-half to Hiram H. Davis, Shelby, Ohio. Filed Dec. 2, 1901. Serial No. 84,694. (No model.)

Claim.—1. In combination with a carbureting-chamber; a normally closed hydrocarbon-feed leading to said chamber; a suitable air-supply also communicating with the chamber; a valve for opening and closing the hydrocarbon-feed; and a motor located in the air-supply pipe and connected to the valve, said motor serving to regulate the quantity of air passing to the carbureting-chamber and to open and close the gasolene-feed valve in proportion to the amount of air-gas withdrawn from the carbureting-chamber.



2. In combination with a carbureting-chamber; a normally closed hydrocarbon-feed leading to said chamber; a suitable air-supply also communicating with the chamber; a valve for opening and closing the hydrocarbon-feed; and a motor located in the air-supply pipe and connected to the valve, said motor serving to regulate the quantity of air passing to the carbureting-chamber and to open and close the gasolene-feed valve in proportion to the amount of air-gas withdrawn from the carbureting-chamber.

3. In combination with a carbureting-chamber; a normally closed hydrocarbon-feed leading to said chamber; a suitable air-supply also communicating with the chamber; a valve for opening and closing the hydrocarbon-feed; a motor located in the air-supply pipe and connected to the valve, said motor serving to regulate the quantity of air passing to the carbureting-chamber and to open and close the hydrocarbon-feed valve in proportion to the amount of air-gas withdrawn from the carbureting-chamber; and means for regulating the action of the motor.

4. In combination with a carbureting-chamber; a hydrocarbon-feed leading to said chamber; a source of air-supply; a pipe connecting said source of supply and the carbureting-chamber; a cylinder located in said pipe; a piston mounted within said cylinder and serving to open and close the passage in the pipe in proportion to the amount of air-gas withdrawn from the carbureting-chamber; a valve for opening and closing the hydrocarbon-feed; and connections intermediate said valve and the piston, whereby the valve will be operated in consonance with the movements of the piston.

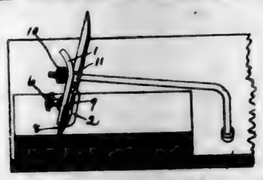
5. In combination with a carbureting-chamber; a hydrocarbon-feed leading to said chamber; a source of air-supply; a pipe leading from said source of air-supply; a cylinder connected to said pipe; a piston mounted in said cylinder; a valve-chamber communicating with said cylinder; a regulating-valve located in said chamber; a pipe leading from said chamber to the carbureting-chamber; a valve located in the hydrocarbon-feed; and connections intermediate said valve and the piston-rod, whereby the piston and valve work in unison.

6. In combination with a carbureting-chamber; a hydrocarbon-feed leading to said chamber; a suitable air-supply also communicating with said chamber; a valve for opening and closing the hydrocarbon-feed; means connected to said valve and operated by the air passing to the carbureting-chamber from the air-supply, said means opening and closing the valve in proportion to the amount of air-gas withdrawn from the carbureting-chamber; a series of dished disks or pans mounted in said carbureting-chamber, each provided with a central opening; a cone-shaped deflector mounted on said pans at a slight distance above the same; and a foraminous cone-shaped member also mounted on the pans and standing at a slight distance from the deflector.

7. In combination with a carbureting-chamber; means for supplying gasolene to the upper end thereof; means for supplying air to the lower end thereof; a series of dished disks or plates mounted in said chamber, each plate being provided with a central opening or aperture; a cone-shaped deflector mounted on each of said disks and at a slight distance therefrom; and a foraminous body seated on each of said disks and surrounding the deflectors at a slight distance therefrom, said bodies being formed with a spiral channel or depression which extends from the upper to the lower end thereof.

8. An evaporating-surface for hydrocarbon-vaporizers, comprising a foraminous body having a generally cone-shaped contour, with a spiral channel or depression extending around the same from the upper end to the lower edge thereof.

709,648. SHEARS-SHARPENER. KONRAD ROESLER, Fort Worth, Tex. Filed Jan. 14, 1901. Serial No. 43,123. (No model.)



Claim.—1. A sharpener for shears comprising a curved body and a jaw adapted to engage a blade and a guide detachably secured to said body and adapted to hold said body in such position that a predetermined bevel will be given to said blade, said guide being attachable at different points of said body whereby the curvature of said body determines the bevel to be given to the blade.

2. A sharpener for shears comprising a body and a jaw adapted to engage a blade, and a guide detachably secured to said body and adapted to hold said body at any desired angle for giving a predetermined bevel to the blade, said guide having a bottom whereby said guide is adapted to slide on even surfaces.

3. A sharpener for shears comprising a body and a jaw adapted to engage a blade and a guide adapted to hold said body at a constant angle, said body having a slot therein and being curved and being provided with means for securing said guide in said slot at various adjustments whereby any desired bevel may be given to the blade.

4. A sharpener for shears comprising a body and a jaw adapted to engage a blade, a thumb-bolt for securing said jaw to said body and on the blade, said body having shoulders for holding the blade in place and a slot therein, said jaw having a tongue resting in said slot, and a guide for said body.

709,649. TUBE FOR GRAIN-DRILLS. LEONARD J. SARGENT and JOSEPH H. SULLIVAN, Cleveland, Ohio. Filed Sept. 30, 1901. Serial No. 77,048. (No model.)

Claim.—1. A grain-drill tube comprising the combination with a tubular duct, of a two-part cup secured upon the outside of one end thereof.

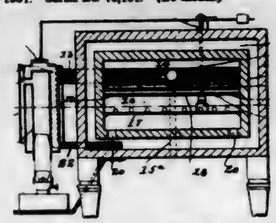
2. The combination with a duct constructed of a helically-wound strip, of a cup secured upon the outside of one end thereof and provided upon the interior with a helical web forming an integral part of the cup and adapted to project between adjacent convolutions of such duct.

3. The combination with a duct constructed of a helically-wound strip, of a two-part cup secured upon the outside of one end thereof, each cup part provided with a helical web adapted to project between adjacent convolutions of such duct.

4. The combination of a duct constructed of a helically-wound strip, a two-part cup adapted to receive one end of said duct, and means for securing said two cup parts, whereby said cup is secured upon said duct.

5. The combination of a duct constructed of a helically-wound strip, a two-part cup adapted to receive one end of said duct, each part provided with a helical web adapted to project between adjacent convolutions of said duct, and means for securing said two parts whereby said cup is secured upon said duct.

709,650. INCUBATOR. OLIVER P. SCOTT, Chicago, Ill. Filed Sept. 23, 1901. Serial No. 76,191. (No model.)



Claim.—1. In an incubator, in combination, outer and inner casings, air-mixing and egg chambers in the inner casing, a perforated air-spreading partition between said chambers, to deliver air from the mixing-chamber to various parts of the egg-chamber, and hot and cold air supply pipes having numerous adjacent discharge-openings in remote parts of the mixing-chamber.

2. In an incubator, in combination, a casing, an egg-chamber and an air-mixing chamber therein, hot-air and cold-air inlet pipes communicating with the mixing-chamber, and a perforated partition between the mixing-chamber and the egg-chamber.

3. In an incubator, in combination, an egg-chamber and an air-chamber therein, an inlet air-pipe having a number of small openings in remote parts of the air-chamber, and a partition between the egg-chamber and the air-chamber having openings therein only near the outer edge thereof.

4. In an incubator, in combination, a casing, a perforated air-distributing partition therein forming air and egg chambers, and foraminate hot and cold air supply pipes extending in proximity to remote parts of the air-chamber.

5. An incubator comprising inner and outer casings spaced apart, an egg-chamber in the inner casing, a heater, an air-supply pipe extending therefrom into the inner casing, air-discharge openings in the bottom of the inner casing communicating with the space between the bottoms of the casings, a tube extending from said space to the heater whereby the air is heated to accelerate the discharge, and independent discharge-passages extending from the egg-chamber through the casings.

709,651. ADHESIVE CEMENT. JOHN T. ROGER, Woodstock, Canada. Filed Feb. 17, 1902. Serial No. 94,484. (No specimens.)

Claim.—1. The herein-described composition of matter consisting of casein, combined with an alkali, infusible oxid, free from acidity or alkalinity, preferably oxid of magnesia, and boiling water.

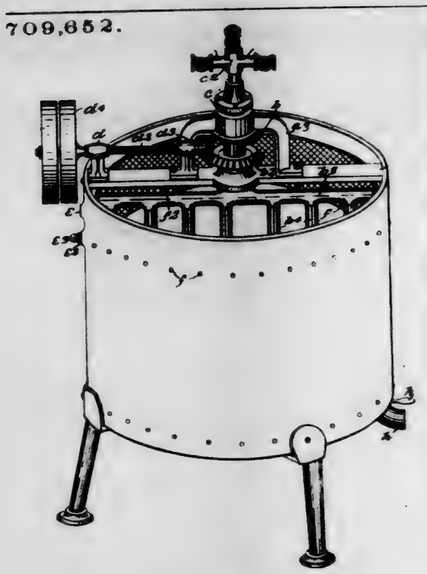
2. The herein-described composition of matter for casein glue or cement, consisting of casein, sixteen parts, alkali, preferably pure (caustic soda) one-half to one and one-half parts, infusible oxid, free from acidity or alkalinity, preferably oxid of magnesia, two parts, water substantially thirty-six parts as described.

709,652. APPARATUS FOR CLEANING CELLULAR TISSUES USED IN CLARIFYING BEER. CHARLES SPRENGER, Jersey City, N. J. Filed Apr. 2, 1902. Serial No. 101,660. (No model.)

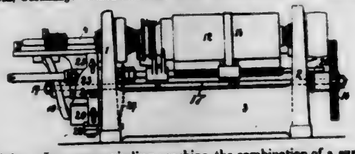
Claim.—1. An apparatus of the class described comprising a tub, a bracket or support secured across the top thereof, a vertically-arranged tube mounted therein and provided at its lower end with a tubular cross-head adapted to turn in said tub, said cross-head being provided with downwardly-directed tubular arms, said tube being provided at its upper end with a coupling having a plurality of branches and means for turning said tube, said tub being also provided near its top with overflow ports or passages, and beneath the same with an annular screen which is secured therein and between which and the walls of the tub is an annular space, substantially as shown and described.

2. In an apparatus of the class described, a tub, a bracket or support secured across the top thereof, a vertically-arranged tube mounted therein and extending downwardly into said tub, and provided at its lower end with a tubular cross-head adapted to turn with said tube in said tub, downwardly-directed tubular arms connected with said cross-head and a three-way coupling connected with the upper end of said tube above said bracket or support, and means for turning said tube, substantially as shown and described.

709,652.



709,653. CROSS-WINDING MACHINE. RUDOLPH VOIGT, Chemnitz, Germany. Filed June 19, 1900. Serial No. 20,843. (No model.)



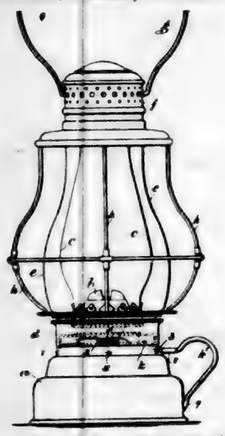
Claim.—In a cross-winding machine, the combination of a supporting-frame, a bobbin-spindle journaled in the same, a thread-guide adjacent said spindle, a shaft journaled in said frame, and carrying a cam engaging said thread-guide for reciprocating the same, a cone-pulley on said spindle, a counter-shaft, a cone-pulley on said counter-shaft, a belt connecting said cone-pulleys, gearing connecting said counter-shaft with the shaft of the cam, a longitudinally-movable shaft mounted in said frame, and provided with a belt-guide for said belt, a cam-plate engaging said longitudinally-movable shaft, mechanism connected with the thread-guide and controlled by the bobbin and engaging said cam-plate, for actuating the same, and a driving-pulley located on the shaft of the bobbin-spindle, substantially as set forth.

709,654. COMBINED LAMP AND LANTERN. FREDERICK B. WAIBEL, Brooklyn, N. Y., assignor to Manhattan Brass Company, New York, N. Y., a Corporation of New York. Filed Sept. 23, 1901. Serial No. 76,188. (No model.)

Claim.—1. In a combined lamp and lantern, the combination with the lantern-base and the reservoir for oil, of a device comprising a spring-arm and integral handle secured to the reservoir and having parts adapted to engage the base of the lantern in connecting the same to the reservoir, said device also serving as a handle for carrying about the reservoir for oil and the parts connected therewith, substantially as set forth.

2. In a combined lamp and lantern, the combination with the lantern-base and the reservoir for oil, of an annulus or collar surrounding and secured to the upper portion of the said reservoir and between which parts there is provided an annular chamber connected to the said annulus or collar and having portions protruding from the opposite sides thereof through apertures in said annulus or collar, the said spring-arms together projecting from the annulus or collar and being bent over into a form to provide a handle with the free ends thereof connected to the reservoir, substantially as set forth.

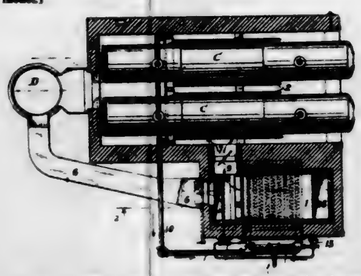
3. In a combined lamp and lantern, the combination with the reservoir for oil, of an annulus or collar surrounding and secured to the upper portion of the said reservoir and between which parts there is provided an annular chamber, the said annulus or collar having mortises at opposite points and a notch in the lower edge at an intermediate point, and spring-arms of curved form within said annular chamber and concentric to the said annulus or collar and having bends 4 5 extending through said mortises and connected by solder to the annulus or collar at a point intermediate to the bends, and the said arms projecting from the said annulus or collar through the said notch and being bent to a configuration forming a handle for the reservoir with the free ends connected rigidly and permanently to the reservoir, substantially as set forth.



4. In a combined lamp and lantern, the combination with the reservoir for oil, of an annulus or collar surrounding and secured to the upper portion of the said reservoir and between which parts there is provided an annular chamber, the said annulus or collar having mortises at opposite points and a notch in the lower edge at an intermediate point, and spring-arms of curved form within said annular chamber and concentric to the said annulus or collar and having bends 4 5 extending through said mortises and connected by solder to the annulus or collar at a point intermediate to the bends and the said arms projecting from the said annulus or collar through the said notch and being bent to a configuration forming a handle for the reservoir with the free ends connected rigidly and permanently to the reservoir, and sleeves 8 surrounding the spring-arms adjacent to and outside of the said annulus or collar and indicating the place to be grasped by the fingers in operating the device, substantially as set forth.

5. In a combined lamp and lantern, the combination with the lantern-base and the reservoir for oil, of an annulus or collar surrounding and secured to the upper portion of the said reservoir and between which parts there is provided an annular chamber, spring-arms within the said annular chamber, and connected to the said annulus or collar and having portions protruding from the opposite sides thereof through apertures in said annulus or collar, the said spring-arms together projecting from the annulus or collar and terminating in devices adapted to be grasped by the fingers of the hand for operating the spring-arms, substantially as set forth.

709,655. METHOD OF SUPERHEATING STEAM. HOSEA WEBSTER, Montclair, N. J. Filed Dec. 12, 1901. Serial No. 85,554. (No model.)



Claim.—1. The method herein described, consisting in superheating steam, primarily by the heat of the combustion in the generator, and then augmenting the temperature of the steam superheated, by a separate and independent source of heat, as set forth.

2. The method herein described, consisting in superheating steam, primarily by the heat of the combustion in the generator, then augmenting the temperature of said superheated steam by a separate and independent source of heat, and then utilizing the waste products of the latter combustion to augment the primary superheating of the steam in the generator, as set forth.

3. The method herein described, consisting in first superheating steam by the heat of combustion in the generator, second, augmenting the temperature of the steam superheated by an auxiliary source of heat, and third, regulating the temperature of the superheated steam, as set forth.

709,656. COIN-CASE. BEAVER B. ANDERSON, Cleveland, Ohio. Filed Jan. 16, 1902. Serial No. 89,943. (No model.)

Claim.—1. A coin-case made of paper comprising a pair of channel-shaped sides, a top piece, and a bottom arranged to be bent to form a hinge for said sides, the edges of the sides not meeting, a strap formed on the outside of one of the sides, and a tongue projecting from the top piece, and adapted to tuck under said strap, substantially as described.

2. A coin-case comprising top and bottom pieces, a pair of channel-shaped sides, said bottom piece adapted to form a hinge for said sides, the edges of the sides not meeting, a strap formed on the outside of one of the sides, a tongue projecting from the top piece adapted to tuck under said strap, and adhesive material adapted to be rendered active by moisture on the under side of said strap, substantially as described.

3. A coin-case made of paper and consisting of a circular bottom portion, a pair of sides extending therefrom, said sides being of channel shape and having their projecting ends bent inward at right angles and glued to the bottom portion, a circular top portion carried by one of the sides and having the ends of that side glued to its under surface, a tongue projecting from the free side of said top portion, an integral strap formed by cutting a pair of slits in the other side, said tongue being adapted to project under said strap, substantially as described.

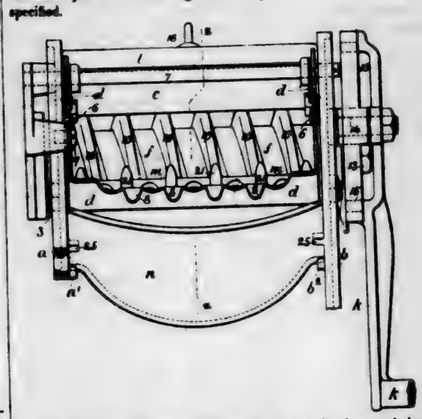
4. A coin-case made of paper and having an integral bottom portion and sides bent upward therefrom, the edges of said sides bent inward onto the sides and there glued to reinforce the sides and to provide slot-openings, top portions projecting inward from the sides, the ends of the outer portions of the sides being glued to the bottom and top portions, and one of the top portions having a tongue adapted to project through a strap carried by the other side, substantially as described.

5. A coin-case made from a single piece of paper, cut to form in consecutive order a top portion, a side, a bottom portion, another side, another top portion, and a projecting tongue, the sides being bent at right angles to said top and bottom portions, and being rounded laterally and glued to the upper surface of the bottom portion and the under surface of the top portion, the edges of the sides being turned inwardly to provide slot-openings, there being a pair of slits cut through the side which does not carry the tongued top piece, whereby there is formed on each side a strap on the inner side of which said tongue may lie, substantially as described.

709,657. PEA-SHELLER. LEWIS A. ASPINWALL, Jackson, Mich., assignor to Aspinwall Manufacturing Company, Jackson, Mich., a Corporation of Michigan. Filed Sept. 26, 1901. Serial No. 76,822. (No model.)

Claim.—1. In a pea-sheller, the combination with the heads or ends having openings forming bearings, of a cylinder comprising a rubber roller with an integral spiral rib, a cylindrical core, end journals or caps and a rod extending through the core and the end journals or caps and by which the said parts are securely clamped together, and devices coacting with the said cylinder for effecting the shelling of the peas, substantially as set forth.

2. In a pea-sheller, the combination with the heads or ends having conical openings forming bearings, of a cylinder comprising a rubber roller with an integral spiral rib, a cylindrical core, end journals or caps and a rod extending through the core and the end journals or caps and by which the said parts are securely clamped together, said end journals or caps being of conical form, and a pinion clamped between one end of the rod and one end journal or cap, and an internal spur-gear meshing with said pinion, a handle for rotating the parts, and devices coacting with the said cylinder for effecting the shelling of the peas, substantially as specified.



3. In a pea-sheller, the combination with the heads or ends having conical openings forming bearings, of a cylinder comprising a rubber roller with an integral spiral rib, a cylindrical core, end journals or caps and a rod extending through the core and the end journals or caps and by which the said parts are securely clamped together, said end journals or caps being of conical form, and a pinion clamped between one end of the rod and one end journal or cap and an internal spur-gear meshing with said pinion, a handle for rotating the parts, and a cam on the opposite end of the said rod, and a shaker device actuated thereby with the rotation of the cylinder for delivering the pods from the machine, and devices coacting with the said cylinder for effecting the shelling of the peas, substantially as set forth.

4. In a pea-sheller, the combination with the heads or ends having conical openings forming bearings, of a cylinder comprising a rubber roller with an integral spiral rib, a cylindrical core, end journals or caps, and a rod extending through the core and the end journals or caps and by which the said parts are securely clamped together, said end journals or caps being of conical form, and a pinion clamped between one end of the rod and one end journal or cap, and an internal spur-gear meshing with said pinion, a handle for rotating the parts, a cam 11 on the opposite end of the rod, and a shaker device comprising a yoke-bar *e* pivoted to the rod 7 of the machine, and an elongated U-shaped plate *d* also pivoted to the same rod of the machine, and a screw connecting the said yoke-bar *e* and the plate *d* and the plate made with downwardly-bent fingers 8 along its delivery edge, and devices coacting with the said cylinder for effecting the shelling of the peas, substantially as set forth.

5. In a pea-sheller, the combination with the heads and a revolvable cylinder having a rubber roller-surface and spiral rib, of a concave pivotally connected between the heads and adjustable in its relation to the cylinder and having on its inner surface ribs inclined in a direction opposite to the spiral of the cylinder, a second concave also connected between the heads of the machine, and means for supporting the same and ribs upon the inner surface of the second concave extending in the same direction as the spiral of the cylinder but at a greater inclination, substantially as set forth.

6. In a pea-sheller, the combination with the heads and a revolvable cylinder having a rubber roller-surface and spiral rib, of a concave pivotally connected between the heads and adjustable in its relation to the cylinder and having on its inner surface ribs inclined in a direction opposite to the spiral of the cylinder, a second concave also connected between the heads of the machine and means for supporting the same, and ribs upon the inner surface of the second concave extending in the same direction as the spiral of the cylinder but at a greater inclination, there being openings between the ribs of the second concave and between the meeting edges of the respective concaves through which the peas are delivered, and a delivery-incline beneath the concaves, substantially as set forth.

7. In a pea-shelling machine, the combination with the heads and a revolvable cylinder having a rubber roller with a surface spiral rib, of the concave / having ribs on its inner surface inclined in a direction opposite to that of the adjacent rubber spiral, said ribs being stepped off in their surface configuration, pivots 16 connecting one edge of the concave between the heads of the machine, stops 20 on the heads, a bar 17 pivoted between the two heads, and an adjusting-screw 18 passing through the bar 17 and bearing against the free edge of the concave / for adjusting the position thereof, substantially as set forth.

8. In a pea-shelling machine, the combination with the heads, and a revoluble cylinder having a rubber roller and spiral rib thereon, of the concave *m* having flanged ends, a rod 3 passing through the flanged ends and through the heads of the machine for connecting said concave between said heads, a second rod 3 upon which the free edge of the concave rests and is supported, said concave having on its inner surface spirally-arranged ribs extending in the same direction as the spiral of the rubber roller, but at a greater inclination and said concave having openings for the peas to pass through, substantially as set forth.

9. In a pea-shelling machine, the combination with the heads and a revoluble cylinder having a rubber roller and spiral rib thereon, of the concave *m* having flanged ends, a rod 3 passing through the flanged ends and through the heads of the machine for connecting said concave between said heads, a second rod 3 upon which the free edge of the concave rests and is supported, said concave having on its inner surface spirally-arranged ribs extending in the same direction as the spiral of the rubber roller, but at a greater inclination and said concave having openings for the peas to pass through, and steps 24 on the inner surfaces of the respective heads coming above the upper surface of the concave at the ends thereof so as to look the same between said legs and the rods 3, substantially as set forth.

10. In a pea-shelling machine, the combination with the heads and stops 6 on the heads of a rod 7 passing across through said heads, a feed-plate *c* having end lugs through which said rod 7 passes for pivotally connecting the said feed-plate thereto between the heads, the free edge of the feed-plate resting upon the stops 6, substantially as and for the purpose set forth.

11. In a pea-shelling machine, the combination with the heads *a b* having ribs *a' b'* and legs 25 upon their lower portions, of the curved delivery-incline *n* resting at its opposite edges upon the said ribs and having notches in said edges receiving the said legs 25 whereby the said incline is held between and supported by the heads and movement thereof prevented, substantially as set forth.

12. In a pea-shelling machine, the combination with the heads, a revolubie cylinder and a cam on one end of the shaft of said cylinder, of a rod 7 passing across through the heads, a feed-plate pivoted to said rod, concaves surrounding the larger portion of the revolubie cylinder and means for supporting the same, a yoke-bar *e* having a jaw receiving the said cam and pivoted to the said rod 7, an elongated U-shaped plate *d* also pivoted to the said rod 7 between the heads, and a screw for securely connecting the same to the yoke-bar *e*, said plate *d* having an edge in close proximity to the edge of one of the concaves and its opposite edge provided with downwardly-bent fingers whereby a shaking motion is imparted to the said plate *d* as the same receives the peas from the concave for delivering the peas over the fingers of the said plate, substantially as set forth.

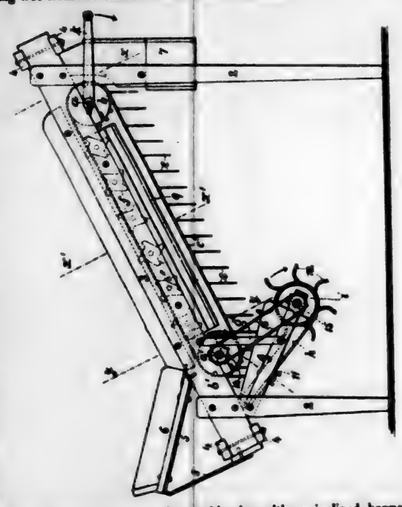
13. In a pea-shelling machine, the combination with the head *a*, of the head *b* and means for connecting the same together, a spanner *b'* integral with a prolongation of said head and adapted to pass over the edge of a table or point of support, a clamp-screw 4 passing up through the lower end of said spanner and said spanner being provided with a vertical mortise, and a plate having a portion thereof recessed to receive the end of the screw 4, and a portion formed as a fan-tail end and passing through the mortise of the spanner and engaging the same when occupying its normal position, whereby the said plate comes between the end of the screw and the point of support and is removably connected to the spanner to prevent accidental separation, substantially as set forth.

14. In a pea-sheller, the combination with the heads or ends having openings forming bearings, of a cylinder comprising a rubber roller with an integral spiral rib, a cylindrical core, end journals or caps and a rod extending through the core and the end journals or caps and by which the said parts are securely clamped together, and a pinion clamped between one end of the rod and one end journal or cap, and an internal spur-gear meshing with said pinion, and a handle for rotating the parts, substantially as specified.

709,658. POTATO-SORTER. LEWIS A. ASPINWALL, Jackson, Mich., assignor to Aspinwall Manufacturing Company, Jackson, Mich., a Corporation of Michigan. Filed Sept. 26, 1901. Serial No. 76,594. (No model.)

Claim.—1. In a potato-sorter, a sorting device for separating the potatoes and retaining only larger potatoes, comprising parallel endless chains, cross-bars extending between and connecting the same, a series of sorting-plates scalloped or serrated along one edge, devices for loosely pivoting and for adjustably connecting said plates to said arms so that in use the scalloped edges rest upon the next adjacent cross-bars and on the return movement the said sorting-plates turn over and hang freely.

2. In a potato-sorter, the combination with an inclined hopper, of two endless parallel chains, devices for connecting said chains and operating the same, cross-bars extending between the chains and connected to opposite links, sorting-plates each having one edge scalloped or serrated, devices at their respective ends for adjustably and loosely pivoting said plates to said cross-bars, so that each plate is pivoted to one cross-bar and is normally supported by the adjacent cross-bar, means for agitating said plates as they are drawn along by the cross-bars with the forward movement of the chains, whereby the sorting-plates turn over and hang free from the chains on the return movement.



3. In a potato-sorter, the combination with an inclined hopper, of two endless parallel chains, devices for connecting said chains and operating the same, cross-bars extending between the chains and connected to opposite links, hubs with arms extending therefrom loosely surrounding the said cross-bars at the respective ends, sorting-plates having at their respective ends a series of holes by which with bolts they are adjustably connected with the arms of said hubs, and toothed-wheel agitators in pairs secured to the frame of the machine beneath the chains and adapted to be operated by the movement of the chains and to come into contact with the said sorting-plates alternately and progressively for raising the same and agitating the potatoes, substantially as set forth.

4. In a potato-sorter, the combination with an inclined hopper, of two endless parallel chains, devices for connecting said chains and operating the same, cross-bars extending between the chains and connected to opposite links, hubs with arms extending therefrom loosely surrounding the said cross-bars at the respective ends, sorting-plates each having one edge scalloped or serrated and having at their respective ends a series of holes by which with bolts they are adjustably connected to the arms of said hubs, and toothed-wheel agitators in pairs secured to the frame of the machine beneath the chains and adapted to be operated by the movement of the chains and to come into contact with the said sorting-plates alternately and progressively for raising the same and agitating the potatoes, substantially as set forth.

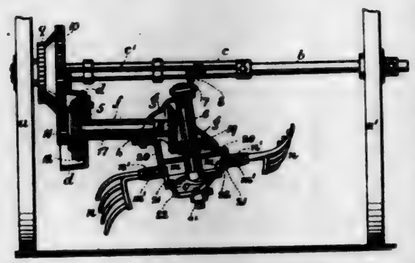
5. In a potato-sorter, the combination with an inclined hopper, of two endless parallel chains, cross-bars connected at their ends to links of the chains, sorting-plates having one edge scalloped or serrated, devices pivoted to the cross-bars and adjustably engaging the ends of the sorting-plates, the said sorting-plates at their serrated edges normally resting upon the said cross-bars so that between their incurves and the cross-bars there are openings, the sizes of which may be increased or diminished and through which openings potatoes may pass, substantially as set forth.

6. In a potato-sorter, the combination with an inclined hopper, of two endless parallel chains, cross-bars connected at their ends to links of the chains, sorting-plates having one edge scalloped or serrated, devices pivoted to the cross-bars and adjustably engaging the ends of the sorting-plates, the said sorting-plates at their serrated edges normally resting upon the said cross-bars so that between their incurves and the cross-bars there are openings the sizes of which may be increased or diminished and through which openings potatoes may pass, and toothed-wheel agitators pivotally connected to the inner faces of the side frames and rotated by the movement of the chains for raising alternate sorting-plates and so agitating the mass of potatoes carried by the said devices, substantially as set forth.

7. In a potato-sorter, the combination with an inclined hopper, of two endless parallel chains, cross-bars connected at their ends to links of the chains, sorting-plates having one edge scalloped or serrated, devices pivoted to the cross-bars and adjustably engaging the ends of the sorting-plates, the said sorting-plates at their serrated edges normally resting upon the said cross-bars so that between their incurves and the cross-bars there are openings the sizes of which may be increased or diminished and through which openings potatoes may pass, and toothed-wheel agitators securely connected to the inner faces of the bar sides and each tooth of which comprises one radial and one inclined edge, the radial edges being acted upon by the chains and the inclined edges raising the sorting-plates alternately and progressively with the movement of the parts, substantially as set forth.

8. In a potato-sorter, the combination with the inclined hopper *g*, of the metal plate 11 transversely thereof, the inclined fingers *h* connected to said plate 11 and let into the upper face thereof, the cylinder *i* above the free ends of said fingers, and pickers 12 arranged in two spiral sets about the cylinder so that there are two pickers at the respective ends of the cylinder coming between the end fingers and four pickers in circular rows upon the said cylinder coming between each of the other fingers, substantially as and for the purposes set forth.

709,659. POTATO-DIGGER. LEWIS A. ASPINWALL, Jackson, Mich., assignor to Aspinwall Manufacturing Company, Jackson, Mich., a Corporation of Michigan. Filed Feb. 3, 1902. Serial No. 92,224. (No model.)



Claim.—1. In a potato-digger, the combination with a plow and grating, of a pulverizer device including bent swinging arms and means for controlling the movements and operative position of said arms when the same are in operative position, and which devices permit the arms out of position to be free, and a separator device including a series of swinging forks, and devices substantially as shown and described for supporting said forks in their operative position but which allow said forks to deliver the potatoes and tops and to hang in a position of gravity during part of their movement, substantially as set forth.

2. In a potato-digger, the combination with the plow and grating, of a pulverizer device comprising a series of bent pivoted arms, a shaft and devices connected thereto and to which said arms are pivotally connected, cranks and rollers on the inner ends of said arms and a cam acting upon said rollers for controlling the movements of said arms and permitting said arms during part of their movement to hang free, substantially as set forth.

3. In a potato-digger, the combination with the plow and grating, of a pulverizer device comprising a series of bent pivoted arms, a shaft and devices connected thereto and to which said arms are pivotally connected, cranks and rollers on the inner ends of said arms, and a cam acting upon said rollers for controlling the movements of said arms and permitting said arms during part of their movements to hang free, a sleeve forming part of the frame of the machine and secured thereto and on one end of which said cam is formed, and gears connecting the opposite end of said shaft to the axis of the machine for effecting the rotary movement of the pulverizer device, substantially as set forth.

4. In a potato-digger, the combination with the plow and grating, of a bearing-sleeve *c* forming part of and secured to the frame of the machine and having a cam *c'* at one end, a shaft 14 passing through said sleeve, a disk *l* and plate *l'* secured together and connected upon one end of the said shaft, a pinion 13 upon the opposite end of said shaft, pulverizer-arms 15 of bent form journaled between the disk *l* and plate *l'*, crank-arms 16 on the ends of said pulverizer-arms and rollers carried thereon and for part of the rotary movement of said pulverizer device bearing upon the surface of the cam *c'*, substantially as and for the purposes set forth.

5. In a potato-digger, the combination with the plow and grating, of a bearing-sleeve *c* forming part of and secured to the frame of the machine and having a cam *c'* at one end, a shaft 14 passing through said sleeve, a disk *l* and plate *l'* secured together and connected upon one end of the said shaft, a pinion 13 upon the opposite end of said shaft, pulverizer-arms 15 of bent form journaled between the disk *l* and plate *l'*, crank-arms 16 on the ends of said pulverizer-arms and rollers carried thereon and for part of the rotary movement of said pulverizer device bearing upon the surface of the cam *c'*, substantially as and for the purposes set forth, a bevel-gear 12, a pinion 11 connected therewith, a shaft and bearings therefor, a gear 10 and ratchet 9 connected together upon the main shaft of the machine with the gear 10 meshing with the pinion 11 for communicating the power and movement of the axle to the pulverizer device, substantially as set forth.

6. In a potato-digger, the combination with the wheels, the axle and a sleeve *c* having side flanges *c'* surrounding said axle, of a dishing frame *d* secured to said flanges *c'*, a frame *h* secured to the frame *d*, a grating-frame *k* secured to the frame *h* and the grating and plow secured respectively to the frame *h* and the grating-frame *k*, substantially as set forth.

7. In a potato-digger, the combination with the wheels, the axle, a sleeve surrounding the axle and side flanges formed with the sleeve, of a dishing frame *d* secured to the said side flanges, a sleeve *f* passing through an opening in the frame *d* and having a flange 5 by which the same is secured to said frame *d*, a lug also formed with the frame *d*, a sleeve *e* and integral cam *e'*, said sleeve passing through a second opening in the frame *d*, and a flange 2 formed with the sleeve *e* and coming against the surface of the frame *d*, flanges 3 formed with the sleeve *e*, and bolts for connecting the said flanges and sleeve to the flange 4 and the lug of the frame *d*, substantially as set forth.

8. In a potato-digger, the combination with the wheels, the axle, a sleeve surrounding the axle and side flanges formed with the sleeve, of a dishing frame *d* secured to the said side flanges, a sleeve *f* passing through an opening in the frame *d* and having a flange 5 by which the same is secured to said frame, a flange 4 formed with the sleeve *f*, a hollow casing *g*, an axle 6 within the same, a bracket 8 secured to the side flanges of the axle-sleeve, and a bolt 7 passing through said bracket and through the hollow casing and axle for connecting the parts, and a ring-frame 20 secured to the sleeve *f* and coming below the hollow casing *g*, substantially as set forth.

9. In a potato-digger, the combination with a fixed axis and means for supporting and inclosing the same, of a separater device comprising a revolubie head *m* and connected bevel-gear 19 surrounding the said axis, a series of swinging forks *n* pivotally mounted in said revolubie head, cranks and rollers on their inner ends, and an adjustable cam-disk secured to the said fixed axis below the plane of the swinging forks, substantially as and for the purpose set forth.

10. In a potato-digger, the combination with a fixed axis and means for supporting and inclosing the same, of a separater device comprising a revolubie head *m* and connected bevel-gear 19 surrounding the said axis, a series of swinging forks *n* pivotally mounted in said revolubie head, cranks and rollers on their inner ends, and an adjustable cam-disk secured to the said fixed axis below the plane of the swinging forks, a shaft 17, a bevel-gear 18 on one end thereof meshing with the aforesaid bevel-gear 19, a pinion 11 on the shaft 17, a gear 10 and connected ratchet 9 on the axis of the machine by which power and rotation are communicated to the device of the separator, substantially as set forth.

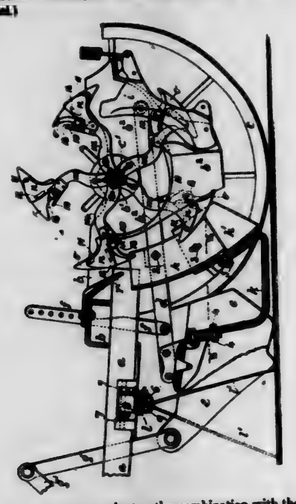
11. In a potato-digger, a separater device comprising a revolubie head *m* having tangent sleeves *m'* projecting from the main portion of said head, a sleeve at the center of said head the same being open underneath, a bevel-gear connected to said head, a fixed axle-support passing through the bevel-gear and sleeve of the head, a series of swinging forks each comprising a multiplicity of tines, an arber passing through a tangent sleeve, a crank on the other end of the arber and within the said head, and a roller on the crank, and a cam disk adjustably mounted on the central supporting-axis and upon which the said rollers bear, substantially as set forth.

12. In a potato-digger, a separater device comprising a revolubie head *m* having tangent sleeves *m'* projecting from the main portion of said head, a sleeve at the center of said head, the same being open underneath, a bevel-gear connected to said head, a fixed axle-support passing through the bevel-gear and sleeve of the head, a series of swinging forks each comprising a multiplicity of tines, an arber passing through a tangent sleeve, a crank on the other end of the arber and within said head, and a roller on the crank, and a cam-disk *o* adjustably secured upon the central supporting-axis and having two substantially flat faces at approximately obtuse angles to one another, the higher surface of said cam being the operative surface thereof and acting to hold the series of forks in their operative position, and the inclined surface permitting the forks to swing upon their arbors, substantially as set forth.

13. In a potato-digger, a separater device comprising a revolubie head *m* having tangent sleeves *m'* projecting from the main portion of said head, a sleeve at the center of said head, the same being open underneath, a bevel-gear connected to said head, a fixed axial support passing through

the bevel-gear and sleeve of the head, a series of swinging forks each comprising a multiplicity of tines, an arbor passing through a tangent sleeve, a crank on the other end of the arbor and within said head, and a roller on the crank, and a cam-disk adjustably mounted on the central supporting-axis and upon which the said rollers bear, and projections 23 upon the cranks of the swinging forks and bearing against the revolvable head for limiting the downward or gravity movements of said swinging forks, substantially as set forth.

709,660. POTATO-PLANTER. LEWIS A. ASPINWALL, Jackson, Mich., assignor to Aspinwall Manufacturing Company, Jackson, Mich., a Corporation of Michigan. Filed Feb. 3, 1902. Serial No. 92,940. (No model.)



Claim.—1. In a potato-planter, the combination with the plow and the chute for delivering the potatoes, of a device rigidly and immovably connected respectively to said parts, extending between the same, and having a horizontal portion lying near the ground and adapted to move with the plow and to come in contact with an obstruction to prevent injury to the chute, substantially as set forth.

2. In a potato-planter, the combination with the plow and the two-part chute and support, of a runner in the form of a bent bar having one end rigidly and immovably connected to the lower part of the chute and the opposite end rigidly and immovably connected to the plow devices, and having a horizontal portion lying near the ground and approximately on the plane of the lower edge of the plow, and adapted to come in contact with an obstruction passed by the plow so as to raise the chute and carry the same over the obstruction and prevent injury thereto, substantially as set forth.

3. In a potato-planter, the combination with the axle and a disk and arms mounted thereon, of picker devices secured to the respective ends of said arms and each comprising plates secured upon opposite sides thereof, a blade between the same and pivoted thereto and having a mortise receiving a pin passing through the same and the outer plates, and a prong and coacting roller secured to said parts and acting to engage or pick up the potatoes and to remove the same, substantially as set forth.

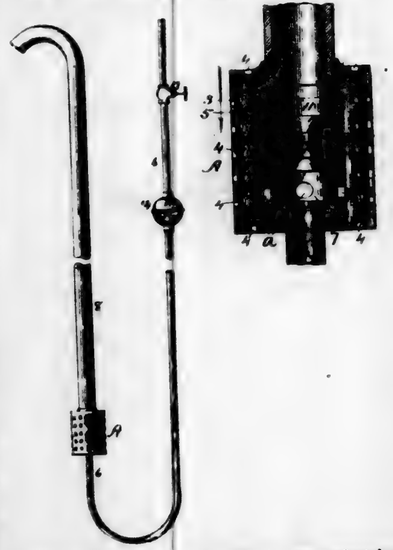
4. In a potato-planter, the combination with the axle and a disk and arms mounted thereon, of picker devices secured to the respective ends of said arms and each comprising plates secured upon opposite sides thereof, a blade between the same and pivoted thereto and having a mortise receiving a pin passing through the same and the outer plates, prongs extending out from the arms and a roller secured to the central blade and moving between said prongs, the prongs passing into the potatoes and said movement swinging the central blades and intermediate roller so as to bring the advancing point of the central blade adjacent to the prongs and the roller acting in the reverse movement of the central blade against the potatoes to remove the same from the prongs, substantially as set forth.

709,661. GAME-BOARD. ARTHUR ARNEAU, New York, N. Y. Filed Sept. 26, 1902. Renewed Feb. 14, 1902. Serial No. 94,128. (No model.)

Claim.—1. A billiard-table comprising a central level floor or field, a marginal inclined floor or field and a rim uprising from and surrounding the inclined floor or field, the said rim being substantially non-resilient and forming a step for changing the direction of the ball while the inclined floor serves to impart to the ball its return motion, substantially as set forth.

2. A game board or table comprising a central level floor or field, a marginal inclined floor or field, a rim surrounding the inclined floor or field, a ball-receiving channel exterior to the said rim and ridges interposed in said channel, the said rim being provided with openings opposite the said ridges, and the exterior wall of the channel being provided with abutments opposite the said openings, whereby a ball, after passing through the opening onto the ridge, will find its way along the channel under the influence of gravity, substantially as set forth.

709,662. AUTOMATIC SIPHON-PUMP. ALBERT BRIESE, Chicago, Ill. Filed Mar. 5, 1902. Serial No. 96,811. (No model.)



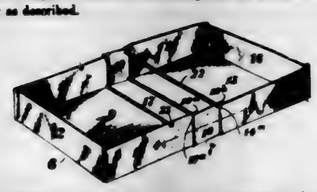
Claim.—1. A siphon-head, comprising an outer perforated casing and an inner hub part, with an annular space between, said hub part having a continuous passage longitudinally therethrough and chambers located in the respective ends thereof connected by a contracted passage and the communicating openings between said annular space and the interior of the hub, substantially as set forth.

2. In a draining device, a siphon-head, comprising an outer perforated casing and an inner tubular hub part having a passage longitudinally therethrough, the passage opening into the lower hub-chamber from said annular space, the feed-pipe, and the discharge-pipe, connected to the opposite ends of the hub part, substantially as set forth.

709,663. DISPLAY-BOX. BERNHARD BEHRENDS, Chicago, Ill. Filed May 21, 1902. Serial No. 108,236. (No model.)

Claim.—1. A folding box, composed of two end members, and an intermediate member pivotally connecting said end members together and consisting of a bottom and two stiff ends wider transversely than the bottom and substantially at right angles therewith, one of said end members being adapted to fold over upon the other and with said intermediate member inclose the same, substantially as described.

2. A folding box, composed of two end members, an intermediate member pivotally connecting said end members together and consisting of a bottom and two stiff ends wider transversely than the bottom and substantially at right angles therewith, one of said end members being adapted to fold over upon the other and with said intermediate member inclose the same, and a cross-bar connecting said stiff ends together, substantially as described.



3. A folding box, composed of two end members, an intermediate member pivotally connecting said end members together and consisting of a bottom and two stiff ends wider transversely than the bottom and substantially at right angles therewith, one of said end members being adapted to fold over upon the other and with said intermediate member inclose the same, and steps adapted to limit the opening of said box, substantially as described.

4. A folding box, composed of two end members, each forming a box-like division open at the top and one side, and an intermediate member pivotally connecting said end members together and consisting of a bottom and two stiff ends wider transversely than said bottom and substantially at right angles therewith, one of said end members being slightly larger than the other and adapted to fold over upon it and with said intermediate member to inclose the same, said intermediate member being adapted when the box is open to form a portion of the bottom and sides of the open box, substantially as described.

5. A folding box, composed of two end members, each consisting of bottom, sides and end portions, and an intermediate member pivotally connecting said end members together and consisting of a bottom and two stiff ends wider transversely than said bottom and substantially at right angles therewith, one of said end members being adapted to fold over upon the other end member and with said intermediate member to inclose the same, said intermediate member being adapted when said box is open to form a portion of the bottom and sides of the open box, the ends of said intermediate member being adapted when said box is closed to lie between the side portions of the end members, on their respective sides of the box, substantially as described.

6. A sample-display box, consisting of a member composed of a bottom, two sides and an end, a second member composed of a bottom, two sides and an end and adapted to shut down over said first member, and a connecting member pivotally connected at its sides with said first two members and composed of a bottom and two stiff ends substantially at right angles therewith, and steps adapted to limit the opening of said box, whereby when said box is open said connecting member will form a portion of the sides and bottom of the open box and when said box is closed, the end pieces of said connecting member will be inclosed within said box and the bottom of said connecting member will inclose said first member, substantially as described.

7. In a sample-display box, the combination with a member composed of a bottom, two sides and an end, of a second member composed of a bottom, two sides and an end and adapted to shut down over said first member, a connecting member hinged along the sides of its bottom to said first and second members and composed of a bottom and two stiff ends, the ends and bottom of said connecting member, when said box is open, forming a part of the sides and bottom of said open box, and the ends of said connecting member, when said box is closed, abutting outside of the sides of the first member and inside the sides of the second member, and steps adapted to limit the opening of said box, substantially as described.

8. In a sample-display box, the combination with a member composed of a bottom, two sides and an end, of a second member composed of a bottom, two sides and an end and adapted to shut down over said first member, a connecting member composed of a bottom and two stiff ends and hinged along the sides of its bottom to said first and second members, the ends and bottom of said connecting member, when said box is opened, forming a part of the sides and bottom of said open box, the ends of said connecting member, when said box is closed, abutting outside of the sides of the first member and inside the sides of the second member, and steps adapted to limit the opening of said box, substantially as described.

9. In a sample-display box, the combination with a member composed of a bottom, two sides and an end, of a second member composed of a bottom, two sides and an end and adapted to shut down over said first member, a connecting member composed of a bottom and two stiff ends and hinged along the sides of its bottom to said first and second members, the ends and bottom of said connecting member, when said box is opened, forming a part of the sides and bottom of said open box, the ends of said connecting member, when said box is closed, abutting outside of the sides of the first member and inside the sides of the second member, when said box is closed, abutting outside of the sides of the first member and inside the sides of the second member, and steps adapted to limit the opening of said box, and a cross-bar secured to the ends of said connecting member, substantially as described.

709,664. PROCESS OF PREPARING BOG-PEAT FOR FUEL PURPOSES. ANTOINE CHABOT, Montreal, Canada, assignor to Alexandre Ducros, Montreal, Canada. Filed Jan. 16, 1902. Serial No. 90,061. (No specimens.)

Claim.—1. A process for the manufacture of fuel from peat consisting in passing the same between disintegrators and causing a current of electricity to pass through the peat between said disintegrators thereby simultaneously pulverizing and carbonizing the same.

2. A process of making fuel from bog-peat consisting in drying the peat, passing the same between a pair of disintegrators, moving the disintegrators relatively to one another to act upon the peat, and passing a current of electricity between said disintegrators and through the peat, thereby simultaneously pulverizing and carbonizing the same.

3. A process of making fuel from bog-peat consisting in drying the peat, passing the same between a pair of disintegrators, causing a current of electricity to pass between said disintegrators and through the peat, thereby simultaneously pulverizing and carbonizing the same, and mixing the carbonized powder with petroleum.

4. A process of making fuel from bog-peat consisting in drying the peat, passing the same between a pair of disintegrators, causing a current of electricity to flow through the peat between said disintegrators, thereby simultaneously pulverizing and carbonizing the same, mixing the carbonized peat with a small proportion of petroleum, and pressing the mixture into briquets or cakes, substantially as described.

5. A process for the manufacture of fuel from bog-peat consisting in subjecting the peat to centrifugal action to eliminate the moisture therefrom, then loading it between a pair of disintegrators, causing the disintegrators to move relatively to each other to act upon the peat, causing a current of electricity to pass between the disintegrators and through the peat, mixing the peat with a proportion of inflammable material, and thereafter pressing it into cakes or briquets substantially as described.

6. A process for the manufacture of fuel from bog-peat consisting in pulverizing the peat and simultaneously carbonizing the same by a current of electricity.

7. A process for the manufacture of fuel from bog-peat consisting in simultaneously drying, pulverizing and carbonizing the peat by passing through it a current of electricity.

8. A process of carbonizing bog-peat for fuel purposes consisting in passing through it a current of electricity.

709,665. FOOT-MEASURING DEVICE FOR SHOEMAKERS. THOMAS CORT, South Orange, N. J. Filed Feb. 5, 1901. Serial No. 46,501. (No model.)

Claim.—1. A shoemaker's foot-measuring device, comprising a case *c*, adapted to engage the heel of a foot, a drum in said case and a flexible measure wound on said drum and projecting from the case, and a tongue *d*, adapted to engage the toe of the foot, slidably mounted upon said flexible measure and connected thereby to the case *c*.

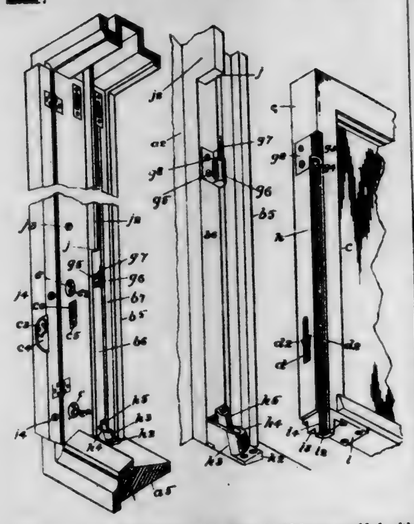
2. A shoemaker's foot-measuring device, comprising a case *c*, and a tongue *d*, said parts having adjacent faces adapted to receive between themselves a foot to be measured, a drum in said case, and a flexible measure wound on said drum and adapted to be drawn out of the case, said measure having at one side size-marks for determining the number of shoe needed and at the other side standard graduations for measuring distances, and said tongue being slidably mounted on the measure.

3. A shoemaker's foot-measuring device, comprising a case *c*, and a tongue *d*, each having a base and a face at right angles to said base, means for fastening said case and tongue together with their faces in contact, and a flexible measure mounted in the case and having its end projecting therefrom and passing loosely through the tongue, and means for preventing said tongue from being slid off the measure.

4. In a shoemaker's foot-measure, the combination of a heel-rest and toe-tongue, means for separably connecting said parts, a reel in said toe-tongue, means for separably connecting said parts, a reel in said heel-rest, a tape wound on said reel and extending out from said heel-rest and passing slidably through the toe-tongue, and a stop on the end of said tape beyond the toe-tongue.

5. In a shoemaker's foot-measure, the combination of a heel-rest, a toe-tongue, and a flexible tape connecting said parts, one of the said parts having means for winding up the tape and the other being slidable on said tape.

709,666. WINDOW FRAME AND SASH. EDWARD DAVEY, New Rochelle, N. Y. Filed Jan. 22, 1902. Serial No. 90,767. (No model.)



Claim.—1. A window-frame, the sides of which are provided with vertically-arranged spaces adapted to receive the sashes, the upper sash and the space in which it is placed being narrower than the lower sash and the space in which it is placed, hinged beads or strips at the front of the frame for holding the lower sash in place, and central beads or strips the upper portions of which are provided with thickened or inwardly-directed members for holding the upper sash in place, vertically-movable sashes mounted in said frame and provided with hinges at one side, a part of said hinges being secured to the frame and a part to the sash, and said parts of said hinges being adapted to engage when the sashes are lowered, whereby said sashes may be swung inwardly, substantially as shown and described.

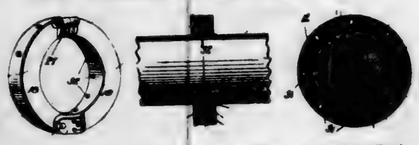
2. A window-frame, the sides of which are provided with vertically-arranged spaces adapted to receive the sashes, the upper sash and the space in which it is placed being narrower than the lower sash and the space in which it is placed, hinged beads or strips at the front of the frame for holding the lower sash in place and central beads or strips the upper portions of which are provided with thickened or inwardly-directed members for holding the upper sash in place, sashes mounted in said frame and provided with hinges at one side, a part of said hinges being secured to the frame and a part to the sash and said parts of said hinges being adapted to engage when the sashes are lowered, whereby said sashes may be swung inwardly, the hinges of the upper sash being counterhinges and adapted to raise said sash in the operation of swinging it inwardly, substantially as shown and described.

3. A window-frame provided with sashes which are vertically movable therein, said sashes being each provided at one side with hinges composed of separate parts, parts of said hinges being secured to the frame and parts to the sashes, said parts of said hinges being adapted to engage only when said sashes are in the lowered position, and the connection between the separate parts of said hinges when said sashes are lowered, being automatic, said frame being also provided with hinged front beads or strips at the sides thereof and with central beads, the upper portions of which are wider than the bottom portions thereof, substantially as shown and described.

4. A window-frame provided with a vertically-movable sash detachably hinged at one side and adapted to turn inwardly, the upper hinge consisting of a cylindrical head secured to the frame and provided with an upwardly-directed plate and a socket-plate secured to the sash and adapted to engage said plate, said sash being grooved vertically to form a space for said head to move in, and the lower hinge consisting of a cam member secured to the frame and a corresponding member secured to the bottom of the sash and adapted to engage therewith, substantially as shown and described.

5. A window-frame provided with a vertically-movable sash and counterbalance cord and weight, the cord being detachably connected with the sash by means of an oblong block *c'* having a transverse piece *c''* and a bottom foot *g* and the window-frame being provided with a pivoted catch *f'* in connection with which said foot operates, substantially as shown and described.

709,667. CAR-LOCK GUARD. HENRY DITCHBURN, Gravenhurst, Canada. Filed Mar. 26, 1902. Serial No. 100,019. (No model.)



Claim.—1. An car-lock guard comprising a removable collar having points projecting radially inward therefrom and adapted to be adjustably clamped over the loom of the car.

2. An car-lock guard comprising an adjustable metallic collar adapted to be clamped over the loom of the car, and a leather wear-collar secured to said metallic collar to take the wear of the rowlocks.

3. An car-lock guard comprising a separable metallic collar adapted to be adjustably clamped upon the loom of the car, a leather collar secured to said metallic collar, and a series of inwardly-projecting points adapted to bite into the car and hold the guard in position thereon.

4. An car-lock guard comprising a flanged separable metallic collar having the two parts thereof hinged at one side and adapted to be adjustably clamped together at the other side, whereby to clamp said collar in position on the car-loom, and a leather collar secured to said metallic collar.

5. An car-lock guard comprising a metallic flanged collar made in two semicircular halves pivoted together at one end and adapted to be adjustably secured to each other at the other, a circular divided leather collar surrounding said metallic collar and having the point of division thereof opposite the free ends of the halves of said metallic collar, and a series of points projecting inwardly from the interior of said metallic collar, said points being adapted to bite into the car-loom or into the leather shield carried thereon and hold the guard in place.

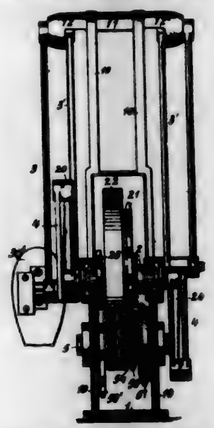
6. An car-lock guard comprising a flanged metallic collar made in two semicircular halves pivoted together at their ends and adapted to be adjustably clamped together at their other ends, a leather collar surrounding said metallic collar and lying against the flanges thereof, and a series of radial screws fitted in sockets formed in the cylindrical flange of said metallic collar and passing through apertures in said leather collar to secure the latter to the metallic collar.

7. An car-lock guard comprising a flanged metallic collar made in two semicircular halves pivoted together at their ends and adapted to be adjustably clamped together at their other ends, a leather collar surrounding said metallic collar and lying against the flanges thereof, and a series of radial screws fitted in sockets formed in the cylindrical flange of said metallic collar and passing through apertures in said leather collar to secure the latter to the metallic collar, said screws having pointed extremities adapted to project inwardly from the inner surface of said metallic collar so as to bite into the car-loom and hold the guard in place when the two halves of the collar are clamped together.

8. An car-lock guard comprising a metallic collar having a cylindrical and a radial flange and formed in two semicircular halves pivoted together at their ends, and having clamping means formed at their other ends, a leather collar surrounding said cylindrical flange and seated against said radial flange, and a series of radial screws fitted in threaded apertures in said cylindrical flange and passing through said leather collar to hold the same in position on the cylindrical flange, said screws having pointed extremities adapted to project inwardly from the inner surface of said cylindrical flange and to bite into the car-loom to hold the guard in place thereon.

9. An car-lock guard comprising a metallic collar formed in two semicircular halves, each having a cylindrical and a radial flange and a pair of pivot-ears connected by a pivot-rod, a pair of clamping-lugs formed at the opposite ends of said collar-halves, a clamping-screw turning in a socket in one of said lugs and in an aperture in the other, whereby to adjustably clamp the halves together, a circular leather collar surrounding said cylindrical flange and projecting slightly thereover and seated against the inner face of said radial flange, said collar being divided at a point opposite the clamped ends of said collar-halves, and a series of radial screws fitted in threaded apertures around the periphery of said cylindrical flange and projecting through said leather collar, whereby to secure the same to said metallic collar; said screws having conically-pointed ends adapted to bite into the car-loom or a leather shield carried thereover and to clamp the guard in place thereon.

709,668. MECHANICAL MOTOR. HENRY S. DURAND, Rochester, N. Y. Filed Feb. 5, 1902. Serial No. 4,812. (No model.)



Claim.—1. In a mechanical motor comprising: a stationary frame having upright sides; a driving-shaft in the forward part of the frame; a counter-shaft behind the driving-shaft; bearings for these shafts secured immediately to each of the upright sides of the frame; and gearing connecting said shafts between their bearings; the combination of: a fly-wheel loosely mounted on and supported by the driving-shaft within the frame and at one side of said gearing; and other gearing connecting the counter-shaft with the fly-wheel between the bearings of the shafts, the latter gearing being at one side of the fly-wheel and between it and the frame; substantially as described.

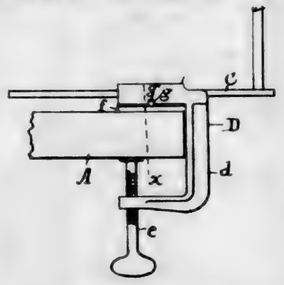
2. In a mechanical motor comprising: a stationary frame having upright sides; a driving-shaft in the forward part of the frame; a counter-shaft behind the driving-shaft; bearings of these shafts secured immediately to each of the upright sides of the frame; a bevel-gear on the counter-shaft between the sides of the frame and near one of these sides; and gearing connecting said shafts between their bearings; the combination of: a fly-wheel loosely mounted on and supported by the driving-shaft within the frame and at one side of said gearing; other gearing connecting the counter-shaft with the fly-wheel between the bearings of the shafts, the latter gearing being at one side of the fly-wheel and between it and the frame; and a bevel-pinion extending behind the gearing that connects the shafts, and engaging with the bevel-gear; substantially as described.

3. In a mechanical motor comprising: a stationary frame having upright sides; a driving-shaft 2 in the forward part of the frame; a shaft 5 behind the driving-shaft; bearings for these shafts secured immediately to each of the upright sides of the frame; and a bevel-gear 51 on the shaft 5 between the sides of the frame and near one of these sides; the combination of: a fly-wheel loosely mounted on and supported by the driving-shaft within the frame; gearing on one side of the fly-wheel, composed of sprockets 21 and 20 on the shafts 2 and 5 respectively and a chain 21'; gearing on the other side of the fly-wheel, composed of sprockets 50' and 23 on the shaft 5 and fly-wheel respectively and a chain 24; and a bevel-pinion 54 extending behind the sprocket 50 and engaging with the bevel-gear 51; substantially as described.

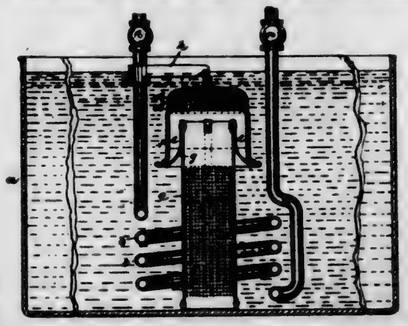
709,669. SET-SUPPORT FOR PING-PONG TABLES. ARVID BE, Portland, Me. Filed July 25, 1902. Serial No. 116,594. (No model.)

Claim.—1. The herein-described post-holder for ping-pong tables consisting of a sliding bar, a post held by said bar, a holding-block having a horizontal opening for the passage of said bar and a narrower horizontal slot beneath said opening and connected therewith, a clamping-block having an I-shaped cross-section, the lower flange of said clamping-block being adapted to rest on the table, the shank fitting in said slot and the upper flange pressing against said bar to hold the same, said holding-block having an L-shaped arm extending beneath the table and a clamping-screw in the lower end of said arm adapted to press upward against the under side of the table.

2. The herein-described post-holder for ping-pong tables consisting of a sliding bar, a post held by said bar, a holding-block having a horizontal opening for the passage of said bar and a narrower horizontal slot beneath said opening and connected therewith, a clamping-block having an I-shaped cross-section, the lower flange of said clamping-block being adapted to rest on the table, the shank fitting in said slot and the upper flange pressing against said bar to hold the same, a pin passing laterally through said clamping-block, said holding-block being provided with a vertical slot through which said pin passes, said holding-block having an L-shaped arm extending beneath the table and a clamping-screw in the lower end of said arm adapted to press upward against the under side of the table.



709,670. HATTER'S HAIR-STRAINER. HARRIS B. FOSTER, Jr., Orange, N. J. Filed Oct. 17, 1901. Serial No. 78,908. (No model.)



Claim.—1. The improved hair-strainer for hatters' rattles, &c., comprising the receptacle *c*, having perforated side walls and an open top, and a hood arranged over the said open top, and forming with said receptacle a passage *e*, substantially as set forth.

2. The combination with the perforated receptacle *c*, having an open top, of a hood arranged over the open top, of said receptacle, and having the upper part thereof perforated, substantially as set forth.

3. The combination with the perforated receptacle *c*, of a flange *f*, secured thereto, and a perforated hood-body removable from said flange, substantially as set forth.

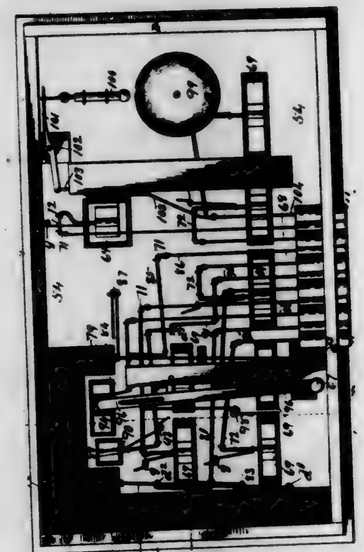
4. The combination with the tank and steam-pipes, of a receptacle open at the top and perforated below said open top and a hood larger in plan than said open top arranged above said steam-pipes and secured in said tank to form a passage *e*, around said open top substantially as set forth.

5. The combination with the tank and steam-pipes, of the receptacle *c*, having cut-passages for the liquid of the tank and an in-passage at the top thereof, and a hood secured over said open top and above said steam-pipes and having perforations above said open top, substantially as set forth.

6. The combination with the tank and steam-pipes, and the receptacle *c*, having an open top and perforated lower part and unperforated upper part, of a hood arranged above said steam-pipes and said receptacle and having a perforated upper part and unperforated lower part, a passage between being formed at said unperforated parts substantially as set forth.

709,671. ACCORDEON. JOHN GALAS, Joliet, Ill. Filed June 13, 1901. Serial No. 64,362. (No model.)

Claim.—1. In an accordion, the combination with a reed-board located in the bellows-chamber, of a keyboard positioned below said reed-board, with an intervening air-space, the cankoo and whistle apertures in the keyboard and opening above the reed-board, the operating key-valves, the enlarged air-aperture, the air-valve covering said enlarged aperture, the push-button, protruding through the bottom of the case, and the independent lever connecting the air-valve and push-button, substantially as described.

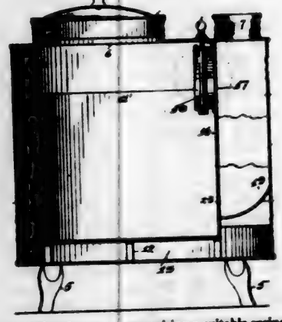


2. In an accordion, the combination with a reed-board, located in the bellows-chamber, the series of reeds attached thereto, one or more of which lie in different planes, the keyboard, positioned below its reed-board and providing an intervening space, the key-valves, opening downwardly from said keyboard, the push-buttons, seated in the lower part of the case, and the operative connection between said buttons and valves, substantially as described.

3. In an accordion, the combination with a reed-board, located in the lower part of the bellows-chamber, a keyboard, positioned below the reed-board, the cankoo and whistle apertures in the keyboard and opening above said reed-board, the series of valves, the push-buttons, seated in the lower part of the case, the operative connections between the valves and buttons, a bell, secured to the keyboard, a plunger-hammer, positioned to strike the bell, and means for actuating said plunger in sounding said bell, substantially as described.

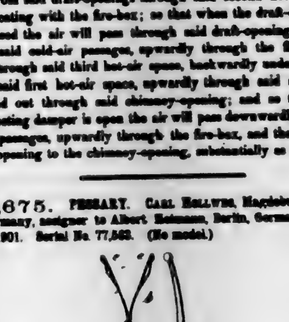
709,672.

709,673. HEATING-STOVE. LEWIS W. HEEP, St. Louis, Mo. Filed Apr. 24, 1902. Serial No. 104,483. (No model.)



Claim.—A heating-stove comprising a suitable casing having a fuel-opening in the forward part of its top, and having a chimney-opening in the rear part of its top, and having draft-openings one on each side of the chimney-opening; draft-inlet dampers controlling said draft-openings; a fire-box mounted in said casing and held up from the bottom to form part of the hot-air space, said fire-box being shortened at the rear to form a second part of the hot-air space communicating with the first hot-air space and with the chimney-opening, and said fire-box being shortened at the front to form a third part of the hot-air space communicating with the first hot-air space and with the top of the fire-box; a wall extending upwardly from the rear edge of the fire-box to the top of the casing in front of the chimney-opening, there being damper-openings in said wall; a draft-directing damper in said damper-opening; and cold-air flues leading from said draft-openings through said second hot-air space and communicating with the fire-box; so that when the draft-directing damper is closed the air will pass through said draft-openings downwardly through said cold-air passages, upwardly through the fire-box, downwardly through said third hot-air space, backwardly under the fire-box through said first hot-air space, upwardly through said second hot-air space, and out through said chimney-opening; and so that when the draft-directing damper is open the air will pass downwardly through said cold-air passages, upwardly through the fire-box, and then through the damper-opening to the chimney-opening, substantially as specified.

709,674. HEATING-STOVE. LEWIS W. HEEP, St. Louis, Mo. Filed Apr. 24, 1902. Serial No. 104,484. (No model.)



Claim.—A heating-stove comprising a suitable casing having a fuel-opening in the forward part of its top, and having a chimney-opening in the rear part of its top, and having draft-openings one on each side of the chimney-opening; draft-inlet dampers controlling said draft-openings; a fire-box mounted in said casing and held up from the bottom to form part of the hot-air space, said fire-box being shortened at the rear to form a second part of the hot-air space communicating with the first hot-air space and with the chimney-opening, and said fire-box being shortened at the front to form a third part of the hot-air space communicating with the first hot-air space and with the top of the fire-box; a wall extending upwardly from the rear edge of the fire-box to the top of the casing in front of the chimney-opening, there being a damper-opening in said wall; a draft-directing damper in said damper-opening; and walls extending backwardly from the fire-box to the casing to reduce the size of said second hot-air space, and forming cold-air passages one on each side of said second hot-air space, said cold-air passages connecting the draft-inlet openings with openings in the lower part of the fire-box, there being bottoms in said cold-air passages; so that when the draft-directing damper is closed the air will pass through said draft-openings downwardly through said cold-air passages, upwardly through the fire-box, downwardly through said third hot-air space, backwardly under the fire-box through said first hot-air space, upwardly through said second hot-air space, and out through said chimney-opening; and so that when the draft-directing damper is open the air will pass downwardly through said cold-air passages, upwardly through the fire-box, and then through the damper-opening to the chimney-opening, substantially as specified.

709,675. PESSARY. CARL HELLWIG, Magdeburg-Sudenburg, Germany, assignor to Albert Heinemann, Berlin, Germany. Filed Oct. 4, 1901. Serial No. 77,563. (No model.)

Claim.—1. A pessary comprising a stout wire of suitable material, one free end of which is split longitudinally forming two spring-acting bent legs while the other end is bent in shape of a ring at an angle to the longitudinal axis of said wire.

2. A pessary comprising in combination a stout wire, one end of which is split longitudinally while the other end is annularly shaped and bent at angle to the body of the wire, a hinged lid at the annular part, substantially as described.

709,676. ELECTRICALLY-OPERATED RAILWAY-SWITCH. JAMES LOMEY, Detroit, Mich. Filed June 21, 1902. Serial No. 112,580. (No model.)

Claim.—1. The combination with the movable contact on the car adapted to be connected with the source of electricity on the car and fixed contacts in the road-bed, of a switch-point structure comprising a vertically-movable switch-point in line with the inner rail of the side track at the junction therewith with the corresponding main rail and formed with an incline or inclines upon the lower face, a box in the road-bed into which the lower portion of the switch-point projects, vertical guide-bearing for said switch-point and operating mechanism instead in said box and comprising two electromagnets in line with the switch-point and adapted to be connected in circuit with the source of electricity on the car, and a bar or carriage slidingly supported in the box beneath the switch-point in line therewith and forming with its opposite ends cores for said electromagnets and means carried by said bar or carriage intermediate said cores and adapted to coöperate with the incline or inclines on the switch-point to raise or lower the same.

2. The combination with the movable contact on the car adapted to be connected to a source of electricity and fixed contacts on the ground adapted to electrically connect therewith in the travel of the car, of a switch-point structure comprising a vertically-movable switch-point in line with the inner rail of the side track at the junction with the corresponding main rail and formed with an incline or inclines upon its lower face, a box in the road-bed formed with an opening in its top through which the switch-point projects into the box and with flanges depending from the top forming vertical guides for said switch-point, two electromagnets arranged oppositely each other in line with the switch-point and having movable cores, parallel guide-bars rigidly uniting said cores together in line with each other and means secured between said guide-bars adapted to coöperate with the incline or inclines on the switch-point to raise or lower the same by the movement of the guide-bars in opposite directions.

3. The combination with the electric car carrying a movable contact adapted to be lowered in contact with the ground and fixed contacts in the road-bed in line with the movable contact and adapted to be electrically connected therewith in the travel of the car, of a switch structure comprising a box in the road-bed at the junction of the inner rail of the side track with the corresponding main-line rail and carrying integral portions of said rails, a switch-point vertically movably supported in line with the inner rail in an opening in the top of the box and forming a junction of said inner rail with the main rail at the elevated position of said switch-point, an incline or inclines formed upon the lower face of the switch-point, a sliding bar or carriage beneath the switch-point in line therewith and provided with means coöperating with the inclines on the switch-point to raise and lower the same by the endwise movement of the sliding bar, and a pair of electromagnets arranged oppositely each other in line with the sliding bar or carriage and independently connected in circuits between the fixed contacts and the return-rail, the ends of the sliding bar or carriage forming cores for said magnets.

4. The combination with the movable contact on the car adapted to be connected to a source of electricity and fixed contacts on the ground adapted to electrically connect therewith in the travel of the car, of a switch-point structure comprising a vertically-movable switch-point in line with the inner rail of the side track at the junction with the corresponding main rail and formed with an incline upon its lower face, a box in the road-bed formed with an opening in its top through which the switch-point projects into the box, two electromagnets arranged oppositely each other in line with the switch-point and having movable cores, parallel guide-bars rigidly uniting said cores in line with each other, a bar having an inclined shoulder carried by said guide-bars and adapted to coöperate with the incline on the switch-point to raise or lower the same by the movement of the guide-bars in opposite directions, a stirrup straddling said bars and a pin carried by said stirrup upon which the switch-point is free to have a limited vertical movement.

709,677. AXLE-BEARING. ROBERT MCLAUGHLIN, Oshawa, Canada. Filed Mar. 5, 1902. Serial No. 96,755. (No model.)

Claim.—1. An axle-bearing comprising an axle-arm and a hub-sleeve both having thrust-bearing surfaces formed thereon, and a compound thrust-washer freely rotatable as a whole between said bearing-

surfaces and comprising an elastic washer faced on both sides by metallic bearing-washers, one or both of which have ears formed on their flat lateral faces interlocking with corresponding notches in the elastic washer.

2. An axle-bearing comprising an axle-arm having a collar, a hub having a thrust-bearing surface formed thereon coacting with said collar, and a compound thrust-washer comprising a washer freely rotatable on a shank between said bearing-surfaces and of resilient material, and metallic washers one on each side thereof, one of which has a lateral flange embracing said elastic washer to hold it in place.

3. An axle-bearing comprising an axle-arm having a thrust-collar, a hub-sleeve having a thrust-shoulder formed thereon, and a compound resilient thrust-washer located between said collar and shoulder and consisting of a heavy washer of elastic material having notches formed in one face thereof, a metallic washer having ears formed on the adjacent face adapted to interlock with said notches, and a second metallic washer having a lateral flange adapted to freely embrace said elastic washer and to form a seat therefor.

4. An axle-bearing comprising an axle-arm, a hub-sleeve turning thereon and having a bearing-surface formed on its outer end, a hub-cap having a lateral flange forming a recess, a washer of resilient material located in said recess, and a notched metallic bearing-washer overlying said resilient washer, said lateral flange of the hub-cap having ears formed on its internal periphery adapted to coact with the edges of said metallic washer to hold the same in place and to permit the same to be removed when the notch therein is brought opposite one of said ears, substantially as described.

5. An axle-bearing comprising an axle-arm, a hub-sleeve turning thereon and having a shouldered bearing-surface at its inner end and a squared bearing-surface upon its outer end, a collar upon said axle-arm coacting with the shoulder, a compound bearing-washer comprising a metallic washer having a lateral flange, a heavy elastic washer seated within said flange and having notches in its opposite face, and a second metallic washer having ears on its adjacent face coöperating with said notches; a hub-cap upon the outer end of the axle having a laterally-projecting flange with a pair of ears formed at opposite sides thereof and on its inner periphery, a heavy resilient washer fitting within the recess of said hub-cap, and a metallic bearing-washer overlying said last-named resilient washer and adapted to take the thrust at the outer end of the wheel, said last-named metallic washer having a notch in its periphery whereby it may be removed from the hub-cap when said notch is brought opposite one of the ears thereon, substantially as described.

6. In a bearing an axle having a collar formed thereon provided with one or more lateral projections, in combination with an axle-box having a shoulder formed therein opposed to the said collar, an elastic washer located between the said collar and shoulder and engaging the said projections, and a metal washer adjacent to the said shoulder and flanged to partly lap over the said elastic washer, substantially as described.

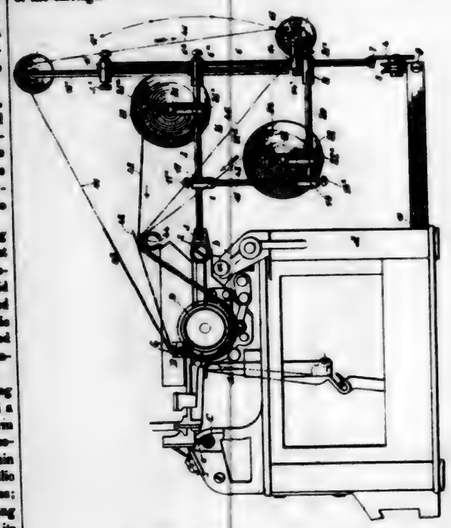
7. In a bearing an axle, and a nut screwed on the end of the axle, in combination with an axle-box, an elastic washer located between the end of the axle-box and the nut, a flange formed on the nut extending inwardly, two projections formed on the flange extending toward the axle, and a metal washer adapted to fit within the flange against the elastic washer and provided with notches in its edges so that it may be pressed to past the aforesaid projections and turned to engage them to hold the elastic washer in place, substantially as described.

8. In a bearing, an axle having a collar formed thereon provided with one or more lateral projections, in combination with an axle-box having a shoulder formed therein opposed to the said collar, an elastic washer located between the said collar and shoulder and engaging the said projections, a nut screwed on the end of the axle, an elastic washer located between the end of the axle and the nut, a flange formed on the nut extending inwardly, two projections formed on the flange extending in toward the axle, and a metal washer adapted to fit within the flange against the elastic washer and provided with notches in its edges so that it may be pressed in past the aforesaid projections and turned to engage them to hold the elastic washer in place, substantially as described.

709,678. TYPE-WRITER. JAMES R. HEARE, Buffalo, N. Y., assignor to the Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed Aug. 2, 1901. Serial No. 70,748. (No model.)

Claim.—1. In a type-writing machine, the combination of a carriage having a platen, means for supporting a plurality of paper strips, an endless copying-ribbon adapted to be received between said paper strips, a guide located near that portion of the platen at which the paper strips and endless copying-ribbon leave it and through which guide all of said paper strips and the endless copying-ribbon pass, said guide consisting of two knives by means of which portions of said paper strips may be detached, and additional guides whereby the endless copying-ribbon is continuously directed between the paper strips and around the platen.

2. In a type-writing machine, the combination of a platen, the carriage having lugs, and a longitudinally-slotted guide-plate located on the delivery side of the platen and provided with arms that ride on the lugs of the carriage.



3. In a type-writing machine, the combination of a carriage having a platen, with a frame connected to move with said carriage, guides adjustable vertically on said frame, an endless copying-ribbon extending around the platen and said vertically-adjustable guides, and roll-holders carried by said frame and adjustable forward and rearward, said roll-holders being adapted to carry rolls of paper.

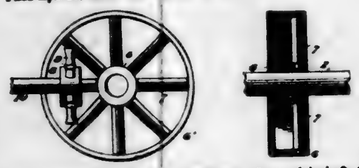
4. The combination, in a type-writing machine, of a carriage provided with lugs, and a guide-plate slotted for the passage of the paper and provided with arms arranged to embrace the said lugs of the carriage and to ride thereon.

5. The combination, in a type-writing machine, of a carriage, a platen, and a slotted paper-guide mounted to slide up and down on the carriage on the delivery side of the platen.

6. The combination, in a type-writing machine, of a carriage having lugs projected therefrom, and a longitudinally-slotted paper guide having upward arms which embrace the said lugs of the carriage and ride thereon.

7. In a type-writing machine, the combination with a platen, means for supporting a plurality of paper strips, and an endless copying-ribbon adapted to be received between said paper strips, of a guide located above the platen and somewhat in the rear of the forward portion thereof, the said copying-ribbon passing through the said guide, and additional guides whereby the endless copying-ribbon is continuously directed between the paper strips and around the platen, the copying-ribbon being thus rearwardly inclined from the point at which it leaves the platen so that it will serve as a support for the original paper strip which is similarly inclined.

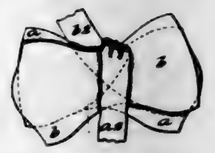
709,679. BICYCLE. CHARLES H. CHAPMAN, Rochester, N. Y. Filed Apr. 29, 1898. Serial No. 679,184. (No model.)



Claim.—In a bicycle, the combination of a pedal-shaft, the cup-shaped wheel having an interior sleeve fixed to the shaft and a concentric rim, rollers journaled to revolve wholly within the cup-shaped depression of the wheel near its mouth, the ends of the rollers being mounted in the sleeve and rim, and a disk-shaped wheel having radially-arranged

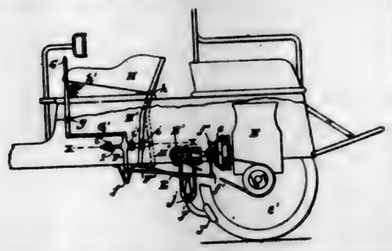
pin-rollers to mesh with the rollers of the cup-wheel, substantially as described.

709,680. NECKTIE. CHARLES REYNOLDS, Jersey City, N. J. Filed July 8, 1902. Serial No. 114,784. (No model.)



Claim.—A butterfly tie consisting of two separate similar parts a and b, said parts being provided with end members a' and b' one of which is folded forwardly and the other backwardly, said parts being then placed together so that the end pieces will be adjacent and across each other, the front end piece being then folded backwardly and the back end piece forwardly and downwardly and backwardly, and said end piece being secured at the back, substantially as shown and described.

709,681. SAFETY DEVICE FOR MOTOR-VEHICLES. ANDREW L. RIKER, New York, N. Y., assignor, by mesne assignments, to Horton Trust Company, trustee, a Corporation of New York. Filed Mar. 2, 1900. Serial No. 7,119. (No model.)



Claim.—1. In a motor-vehicle, a motor, a driven road-wheel, intermediate transmission mechanism and a clutch between said transmission mechanism and the motor, means under the control of the occupant to apply and disconnect the clutch to propel the vehicle, and automatic means to release said clutch upon rising of the occupant from the seat of the vehicle.

2. In a motor-vehicle, a motor, a driven road-wheel, intermediate transmission mechanism and a clutch between said transmission mechanism and the motor, means under the control of the occupant to apply and disconnect the clutch to propel the vehicle, and automatic means to release said clutch, a brake for said vehicle, and means for applying said brake simultaneously with the automatic release of the clutch.

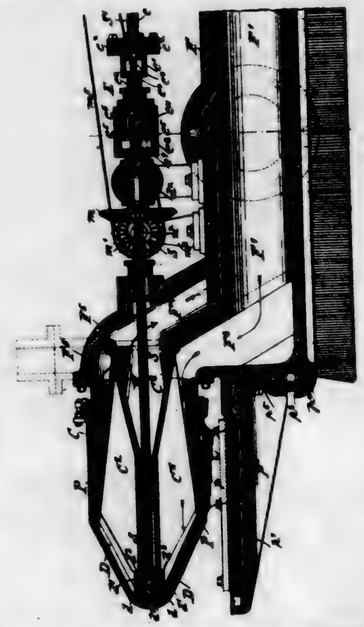
3. In a motor-vehicle, a motor of the type adapted to operate irrespective of variations in speed or stopping of the vehicle, a driven road-wheel, clutch connections to make or interrupt transmission of power from the engine, automatic means to release the connections, means under the control of the occupant to effect connections between the motor and the driven wheel, a brake for retarding the vehicle and automatic means for applying the brake.

4. In a motor-vehicle, a driving-motor and a driven road-wheel, intermediate transmission mechanism and a clutch to operatively connect or disconnect the power-transmission system, a single operating connection for said clutch and a plurality of means for actuating said connections, including an automatic means.

5. In a motor-vehicle, a driving-motor and a driven road-wheel, intermediate transmission mechanism and a clutch to operatively connect or disconnect the power-transmission system, a single operating connection for said clutch, a plurality of means for actuating said connections including an automatic means, a brake and means operating with said automatic connections to apply the brake upon the release of the clutch.

6. In a motor-vehicle, an engine adapted to rotate upon the stopping of the vehicle, a friction-clutch for disconnecting said engine from the power-transmission mechanism, a brake for retarding the vehicle, an automatic means for releasing said vehicle-clutch and applying the brake, said means including a spring-actuated cam adapted to be released upon removing the weight of the occupant.

709,682. ROTARY SLIDE-VALVE FOR PUMPS, COMPRESSORS OR MOTORS. LOUIS ROEDEL, Passaic, N. J. Filed Mar. 24, 1900. Renewed June 10, 1902. Serial No. 111,033. (No model.)



Claim.—1. The combination, with a stationary cylinder having interior inlet and outlet channels, of a rotary slide-valve at the head of said cylinder, a shaft connected at one end with said valve, means for imparting rotary motion to said shaft, and a balancing device arranged at the opposite end of said shaft, substantially as set forth.

2. The combination, with a stationary cylinder having interior inlet and outlet channels and inlet and outlet ports, of a rotary slide-valve having ports registering with the inlet or outlet ports of the cylinder, and a reciprocating plunger guided on the cylinder, substantially as set forth.

3. The combination, with a stationary cylinder having interior inlet and outlet channels and inlet and outlet ports, and a supporting-frame having supply and discharge channels communicating with one end of said channels, of a rotary slide-valve having ports registering successively with the inlet and outlet ports, a plunger on the cylinder, and means for imparting reciprocating motion to said plunger substantially as set forth.

4. The combination of two stationary cylinders having interior inlet and outlet channels and inlet and outlet ports and provided each with a conical outer end, conical slide-valves, one for each cylinder, rotating in contact with the same, thrust-bearings, one for each slide-valve, arranged at the apex of its cylinder, and a shaft connecting the slide-valves of both cylinders, substantially as set forth.

5. The combination, with two stationary cylinders having interior inlet and outlet channels, of rotary slide-valves at the heads of said cylinders, shafts connected with said valves, means for imparting rotary motion to said shafts, and a balancing device interposed between the inner ends of the shafts, substantially as set forth.

6. The combination, with two stationary cylinders arranged axially in line with each other and provided with interior inlet and outlet channels, of conical slide-valves at the ends of said cylinders, means for imparting rotary motion to the slide-valves, plungers guided on said cylinders, and means for imparting reciprocating motion to said plungers, substantially as set forth.

7. The combination, with two stationary cylinders having interior inlet and outlet channels, of slide-valves on the heads of said cylinders, shafts connected with the slide-valves, means for imparting rotary motion to said shafts, and a balancing device between the inner ends of said shafts, said balancing device consisting of a differential piston, a larger piston, cylinders for said pistons, and couplings between the shafts and cylinders, substantially as set forth.

8. The combination, with two stationary cylinders having interior

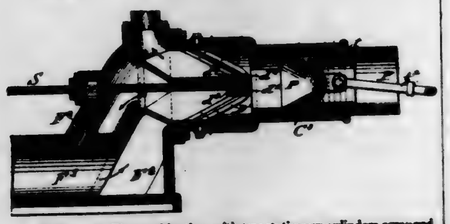
inlet and outlet channels, of rotary slide-valves on the heads of said cylinders, plungers guided on said cylinders, means for connecting said plungers, and means for simultaneously reciprocating both plungers, substantially as set forth.

9. The combination, with a stationary cylinder having interior inlet and outlet channels and inlet and outlet ports and provided with a conical outer end, of a slide-valve, a thrust-bearing for the head of the slide-valve at the apex of the cylinder, a cut-off valve interposed between said slide-valve and cylinder, and a thrust-bearing for said cut-off valve at the apex of the cylinder in line with the bearing of the slide-valve, substantially as set forth.

10. The combination of a stationary cylinder having interior inlet and outlet channels and inlet and outlet ports and provided with a conical outer end, of a slide-valve, a thrust-bearing for the head of the slide-valve at the apex of the cylinder, a shaft connected with said slide-valve, means for imparting rotary motion to said shaft, and a balancing device arranged at the opposite end of said shaft, substantially as set forth.

11. The combination, with a stationary cylinder having interior inlet and outlet channels, said cylinder being provided with spring-plates in its outlet-ports, of a rotary slide-valve on the head of said cylinder, and a reciprocating plunger guided on said cylinder, substantially as set forth.

709,683. ROTARY SLIDE-VALVE FOR PUMPS, COMPRESSORS, OR MOTORS. LOUIS ROSSEL, Passaic, N. J. Original application filed Mar. 24, 1900, Serial No. 10,086. Divided and this application filed June 28, 1900. Renewed June 10, 1902. Serial No. 111,037. (No model.)

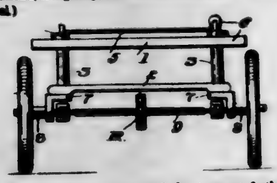


Claim.—1. The combination, with two stationary cylinders arranged axially in line with each other and provided with interior inlet and outlet channels, of conical slide-valves at the ends of said cylinders, means for imparting rotary motion to the slide-valves, plungers guided in said cylinders, and means for imparting reciprocating motion to said plungers, substantially as set forth.

2. The combination, with a stationary cylinder having interior inlet and outlet channels, of a rotary slide-valve on the head of said cylinder, a stationary pressure-receiving plate having ports corresponding to the ports of the cylinder, and a reciprocating plunger for said cylinder, substantially as set forth.

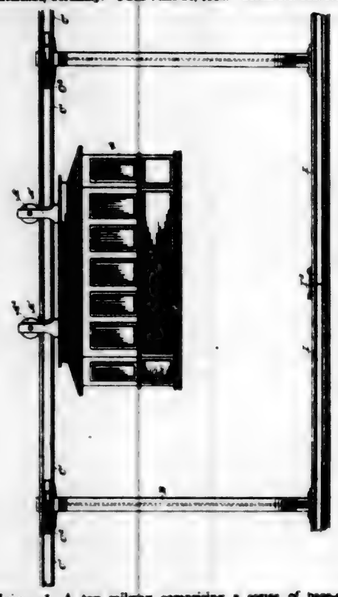
3. The combination, with a stationary cylinder having interior inlet and outlet channels, of a rotary slide-valve on the head of said cylinder, a stationary pressure-receiving plate having ports corresponding to the ports of the cylinder, a reciprocating plunger for said cylinder, and a balancing device at the inner end of the valve-shaft, substantially as set forth.

709,684. STEERING DEVICE FOR AUTOMOBILES. GUSTAV R. SCHLOSSBERGER, Allegheny, Pa. Filed Jan. 21, 1902. Serial No. 90,092. (No model.)



Claim.—In a steering apparatus of the type set forth, the combination of a vehicle-body and a cross-piece carried thereby with hollow standards interposed between said vehicle-body and cross-piece, rods turnably secured within said hollow standards and carrying collars at their upper ends engaging the vehicle-body, right-angular extensions rigidly secured to the lower ends of said rods and engaging the under face of the cross-piece, sleeves formed integral with the depending portions of said extensions with wheeled axles mounted in said sleeves, the inner ends of said axles extending beyond said depending portion of the extension and carrying knuckle-joints, and a connecting-rod secured to the upper ends of the rods, substantially as described.

709,685. TOY RAILWAY. ADOLF RICHTER, Rudolstadt, Germany, assignor to Friedrich Adolf Richter, Rudolstadt, Schwarzburg-Rudolstadt, Germany. Filed June 20, 1902. Serial No. 112,423. (No model.)



Claim.—1. A toy railway comprising a series of base-sections, means for detachably connecting them, a series of posts carried by said base-sections detachably, and track-sections detachably carried by the posts.

2. A toy railway comprising a series of base-sections, means for detachably connecting them, posts carried by said base-sections, and a track detachably carried by said posts.

3. A toy railway comprising base-sections, means for connecting them, posts, clamps for connecting the posts with the base-sections, and a track detachably carried by the posts.

4. A toy railway comprising base-sections provided at their adjacent ends with pins and sockets to receive them, and with means for preventing a separation of the sections by a longitudinal pull, posts carried by said sections, and a track detachably carried by the posts.

5. In a toy railway, a track and an operating projection movable transversely of the track and adapted to engage a brake-actuating mechanism on the car.

6. In a toy railway, a series of posts, a junction-piece carried by each post, and rail-sections arranged for detachable engagement with said junction-piece.

7. In a toy railway, a series of posts, a rail-support carried by each post, and rail-sections arranged for detachable connection with said supports.

8. In a toy railway, a series of posts, a rail-support carried by each post, clamping members projecting from said rail-supports, and rail-sections arranged to engage the said supports.

9. In a toy railway, a series of posts, a rail-supporting junction-piece carried by each post and provided with clamping members projecting from its ends, and rail-sections arranged for detachable engagement with said junction-piece and its clamping members.

10. In a toy railway, a series of posts, a junction-rail carried by each post and provided with a hollow head, and with spring members projected therefrom longitudinally, and rail-sections adapted to be engaged by said spring members and provided with pins arranged to enter the hollow head of the junction-rail.

709,686. CAR-COUPLING. WILLIAM T. SEARLE and EDWARD M. KEPPLE, Goff, Pa. Filed June 5, 1902. Serial No. 110,314. (No model.)

Claim.—1. In a car-coupling, the combination with a draw-head, of a swinging holder mounted within said draw-head having an opening through the same, and a coupling-pin passing through said opening and through an opening in the bottom of the draw-head and adapted to swing with said holder by the engagement of the coupling-link with said pin during the insertion of said link in the draw-head, said pin being adapted to pass through said link and come in contact with the forward end of the opening in the draw-head when the link is in its position for coupling.

2. In a car-coupling, the combination with a draw-head, of a swinging holder mounted within said draw-head having an opening through the same, a coupling-pin passing through said opening and through an opening in the bottom of said draw-head and adapted to swing with said holder by the engagement of the coupling-link with said pin during the insertion of said link in the draw-head, said pin being adapted to pass through said link and come in contact with the forward end of said opening in the draw-head when the link is in position for coupling, and a stop within said draw-head to limit the movement of said link during its insertion in said draw-head.

3. In a car-coupling, the combination with a draw-head, of a swinging holder mounted within said draw-head having an opening through the same, a coupling-pin passing through said opening and through an opening in the bottom of said draw-head and adapted to swing with said holder by the engagement of the coupling-link with said pin during the insertion of said link in the draw-head, said pin being adapted to pass through said link and come in contact with the forward end of said opening in the draw-head when the link is in position for coupling, and a dog mounted in said draw-head adapted to be raised by the swinging of said pin to permit of the insertion of said link in the draw-head and engage with said pin to return and hold said pin and holder in their normal positions.

4. In a car-coupling, the combination with a draw-head, of a swinging holder mounted within said draw-head having an opening through the same, a coupling-pin passing through said opening and through an opening in the bottom of said draw-head and adapted to swing with said holder by the engagement of the coupling-link with said pin during the insertion of said link in the draw-head, said pin being adapted to pass through said link and come in contact with the forward end of said opening in the draw-head when the link is in position for coupling, a dog mounted in said draw-head adapted to be raised by the swinging of said pin to permit the insertion of the link in the draw-head and engage with said pin to return and hold said pin and holder in their normal positions, and a stop or projection on said dog adapted to hold said link in position around said pin.

709,687. COVER FOR MEMORANDUM-BOOKS. HILDA VERNON, Brooklyn, N. Y. Filed Apr. 17, 1902. Serial No. 103,376. (No model.)

Claim.—1. As a new article of manufacture, a memorandum, note, blank or other book cover formed with pockets upon the outer surfaces of the covers of the material surfacing the covers, said pockets having a fold within the boundaries of the covers, substantially as set forth.

2. As a new article of manufacture, a memorandum, note, blank or other book cover having pockets upon the outer surfaces of the covers formed from the fabric or material surfacing the covers by folding such material prior to securing the same to the cover-boards, said pockets having a fold within the boundaries of the covers, substantially as set forth.

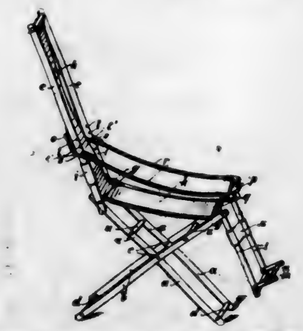
3. As a new article of manufacture, a memorandum, note, blank or other book cover having pockets upon the outer surfaces of the covers, formed from the fabric or other material surfacing the covers, by folding such material over twice, that is, with a double fold upon itself, so that there is an inner folded edge 2 and an outer folded edge 3, prior to securing the same to the cover-boards, substantially as set forth.

4. As a new article of manufacture, a memorandum, note, blank or other similar book, having pockets upon the outer surfaces of both covers formed by folding the fabric or other surface material of the cover over double upon itself so that there is an inner folded edge 2 and an outer folded edge 3, and the fold for the back of the cover comes upon a line 4 at right angles to the said folded edges, whereby in the completed cover there are pockets in the outer faces of both covers and the folded edge 3 comes adjacent to the upper part of the book-cover, substantially as set forth.

5. As a new article of manufacture, a memorandum, note, blank or other book cover formed from binders'-board sides, and a piece of fabric or other suitable surfacing material that is folded over twice, that is, with a double fold upon itself, so that there is an inner folded edge 2 and an outer folded edge 3, and so that a receptacle or pocket is formed between the folded portions on the outer surface of the cover.

6. As a new article of manufacture, a memorandum, note, blank or other book cover formed from binders'-board sides, and a piece of fabric or other suitable surfacing material that is folded over twice, that is, with a double fold upon itself, so that there is an inner folded edge 2 and an outer folded edge 3 that extend across both covers and around the book, and so that a receptacle or pocket is formed between the folded portions on the outer surfaces of the covers, and which, when the book is opened out flat extends between the extreme edges of the covers.

709,688. ADJUSTABLE FOLDING CHAIR. FRITZ VOGEL, Dusseldorf, Germany. Filed Apr. 2, 1901. Serial No. 54,095. (No model.)



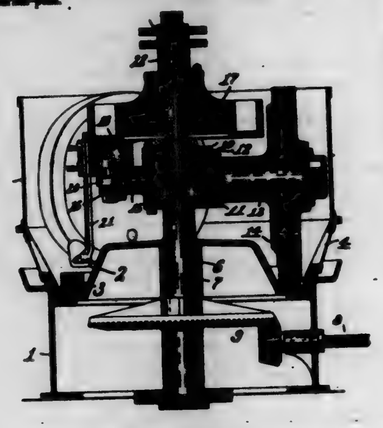
Claim.—In a folding chair, the combination of the hinged and folding base consisting of crossed legs *a a* and *b b*, connected at their common center by pivots *c*; the back-frame *e e* hinged to the upper ends of the legs *a a*; the leg-rest *l l* pivoted to the upper ends of the legs *b b* and having standards *q q* projecting from the upper ends of its respective members; the flexible arm-rests *r r* connected in front to the tops of the standards *q q* and at back at variable height to the members *e e* of the back-frame; springs *o* affording yielding support to the rear ends of the arm-rests and means for limiting the automatic vertical movement of the rear ends of said arm-rests; substantially as described.

709,689. CHILIAN MILL. GEORGE F. WADDELL and WILLIAM J. EVANS, Anaconda, Mont. Filed Jan. 11, 1902. Serial No. 89,340. (No model.)

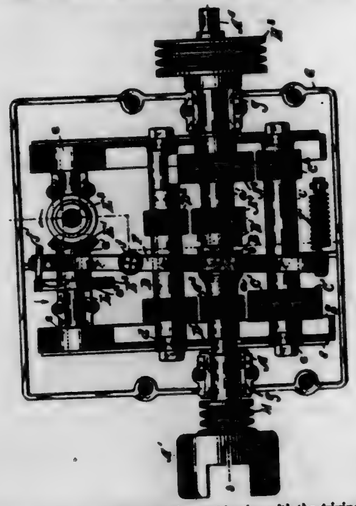
Claim.—1. The combination, substantially as set forth, of a main shaft, a sphere mounted thereon, a spider-hub loosely mounted on the sphere, journal-arms projecting rigidly from the hub, rolls mounted on the journal-arms, a die cooperating with the rolls, drag-arms projecting from the hub, journal-pins carried by the drag-arms, a rotary annular pan discharging on the die and rolls, secured to the shaft above the hub, journal-pins projecting from the bottom of the rotary pan, and links connecting the journal-pins of the water-pan with those of the drag-arms.

2. The combination, substantially as set forth, of a main shaft, a sphere mounted thereon, a spider-hub mounted on the sphere, journal-arms projecting from the hub, rolls mounted on the journal-arms, a die cooperating with the rolls, drag-arms projecting from the hub, journal-

pins carried by the drag-arms, a driving-disk secured to the shaft above the hub, journal-pins projecting from the driving-disk to positions in front of the drag-arms, and links connecting the journal-pins of the driving-disk with those of the drag-arms, said links having vertical play upon said journal-pins.



709,690. VARIABLE-SPEED AND REVERSING GEAR. HENRY J. WHITCOMB, Mount Vernon, N. Y., assignor to H. Ward Leonard, Bronxville, N. Y. Filed Aug. 30, 1901. Serial No. 73,772. (No model.)



Claim.—1. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower-speed gear for connecting said shafts around said clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, and a shifting mechanism for placing said lower-speed gear into and out of mesh with the driving and driven shafts, substantially as set forth.

2. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, two lower-speed gears for connecting said shafts around said clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, and a shifting mechanism for placing said lower-speed gears into and out of mesh with the driving and driven shafts, substantially as set forth.

3. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower-speed gear for connecting said shafts around said clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, a reciprocating slide for placing said lower-speed gear into and out of mesh with the driving and driven shafts, and means for shifting said slide, substantially as set forth.

4. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, two lower-speed gears, two shafts on which said gears are mounted and arranged parallel with the first-named shafts, for connecting said shafts around the clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, a reciprocating slide for placing said lower-speed gears into and out of mesh with the driving and driven shafts, and means for shifting said slide, substantially as set forth.

5. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower-speed gear for connecting said shafts around said clutch, a spring-actuated lever for moving said clutch, a cam for controlling the movement of said lever, means for moving said cam to permit said lever to shift the clutch, and a shifting mechanism for placing said lower-speed gear into and out of mesh with the driving and driven shafts, substantially as set forth.

6. In a power-transmitting gear, the combination with a driving and a driven shaft, of a clutch for making direct connection between said shafts, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, and a reversing-gear for connecting said shafts around the clutch to rotate the driven shaft in a direction opposite to the direction of rotation of the driving-shaft, substantially as set forth.

7. In a power-transmitting gear, the combination with a driving and a driven shaft, of a clutch for making direct connection between said shafts, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, and a reversing-gear for connecting said shafts around the clutch to retain the driven shaft in a direction opposite to the direction of rotation of the driving-shaft, substantially as set forth.

8. In a power-transmitting gear, the combination with a driving and a driven shaft, of a clutch for making direct connection between said shafts, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, and a reversing-gear for connecting said shafts around the clutch to retain the driven shaft in a direction opposite to the direction of rotation of the driving-shaft, said gear comprising driven and driving pinions mounted independently, an intermediate gear for changing the direction of rotation, and means for shifting said reversing-gear into and out of mesh, substantially as set forth.

9. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower-speed gear for connecting said shafts around said clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, a shifting mechanism for placing said lower-speed gear into and out of mesh with the driving and driven shafts, and means forming part of the shifting mechanism whereby said lower-speed gear will be locked in operative position, substantially as set forth.

10. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between the said shafts, two lower-speed gears for connecting said shafts around said clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, a shifting mechanism for placing the said lower-speed gears into and out of mesh with the driving and driven shafts, and means forming part of the shifting mechanism whereby said lower-speed gears will be locked in operative position, substantially as set forth.

11. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower-speed gear for connecting said shafts around said clutch, means for controlling said clutch, a reciprocating slide for placing said lower-speed gear into and out of mesh with the driving and driven shafts, means for shifting said slide, said means also constituting a locking means for locking said slide against movement when said lower-speed gear is in mesh with said driving and driven shafts, substantially as set forth.

12. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between the said shafts, two lower-speed gears, two shafts on which said gears are mounted and arranged parallel with the first-named shafts for connecting said shafts around the clutch, means for controlling said clutch, a shifting mechanism for placing said lower-speed gears into and out of mesh with the driving and driven shafts, and means forming part of the shifting mechanism whereby said lower-speed gears will be locked in operative position, substantially as set forth.

13. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between the said shafts, two lower-speed gears, two shafts on which said gears are mounted and arranged parallel with the first-named shafts for connecting said shafts around the clutch, means for controlling said clutch, a reciprocating slide for placing said lower-speed gears into and out of mesh with the driving and driven shafts, means for shifting said slide, said means also constituting a locking means for locking said slide against movement when said lower-speed gears are in mesh with the driving and driven shafts, substantially as set forth.

14. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower-speed gear for connecting said shafts around said clutch, means for controlling said clutch, a reciprocating slide for placing said lower-speed gear into and out of mesh with the driving and driven shafts, eccentrics for reciprocating said slide, said eccentrics being arranged so as to be on dead-centers when the lower speed is in mesh, and means for rotating said eccentrics, substantially as set forth.

15. In a variable gear, the combination with the driving and driven shafts, a clutch for making direct connection between said shafts, a lower-speed gear on each side of said driving and driven shafts, said lower-speed gears being mounted on shafts parallel with the first-named shafts for connecting said first-named shafts around the clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, a reciprocating slide carrying the shafts of said lower-speed gears, and means for reciprocating said slide for simultaneously moving one lower-speed gear into mesh with the gears of the driving and driven shafts and the other out of mesh, substantially as set forth.

16. In a variable gear, the combination with the driving and driven shafts, a clutch for making direct connection between said shafts, a lower-speed gear on each side of said driving and driven shafts, two shafts on which said gears are mounted and arranged parallel with the first-named shafts for connecting said first-named shafts around the clutch, means for controlling said clutch, a reciprocating slide carrying the shafts of said lower-speed gears, and eccentrics for reciprocating said slide for simultaneously moving one lower-speed gear into mesh with the gears of the driving and driven shafts and the other out of mesh, and said eccentrics being arranged so as to be on dead-centers when either of the lower-speed gears are in mesh, substantially as set forth.

17. A driving-shaft provided with a pinion, a driven shaft in line therewith provided with a gear-wheel, a jaw-clutch for connecting and disconnecting said shafts, a lever for operating said clutch, a parallel speed-reducing shaft, a gear-wheel and pinion on said shaft which mesh respectively with the pinion and gear-wheel on the driving and driven shafts, and operating means whereby said gears or said clutch can be brought into operative relation, and said means operating to prevent the simultaneous engagement of said gears and said clutch.

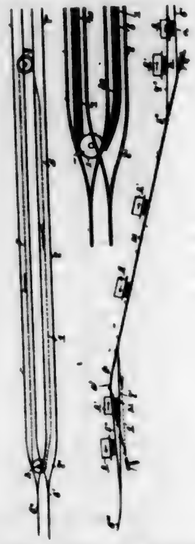
18. A driving-shaft provided with a pinion, a driven shaft in line therewith provided with two gear-wheels, a jaw-clutch for connecting and disconnecting said shafts, a lever for operating said clutch, a parallel speed-reducing shaft provided with a gear-wheel and pinion which mesh respectively with the pinion on the driving-shaft and one of the gear-wheels on the driven shaft, a second parallel speed-reducing shaft provided with a gear-wheel adapted to mesh with the pinion on the driving-shaft and a pinion adapted to mesh with the second gear-wheel on the driven shaft, and operating means whereby said gears or said clutch can be brought successively into operative relation, and said means operating to prevent the simultaneous engagement of either of said low-speed gears and said clutch.

19. A change-speed gear having in combination two end-to-end shafts, gear-wheels on said shafts, a clutch for connecting said shafts, a spring-actuated lever for operating said clutch, a cam for controlling the movement of said lever, a reciprocating slide, a speed-changing shaft carried by said slide and provided with a gear-wheel and pinion adapted to mesh with the gear-wheels on the first-named shafts, and a single means for simultaneously reciprocating said slide and rotating said cam, whereby, by a continuous movement of said means, said clutch and speed-changing gears are respectively moved into and out of engagement.

20. A change-speed gear having in combination two end-to-end shafts, gear-wheels on said shafts, a clutch for connecting said shafts, a spring-actuated lever for operating said clutch, a cam for controlling the movement of said lever, a reciprocating slide, two speed-changing shafts carried by said slide and each provided with a gear-wheel and pinion adapted to mesh with the gear-wheels on the first-named shafts, and a single means for simultaneously reciprocating said slide and rotating said cam, whereby, by a continuous movement of said means, said clutch and speed-changing gears are successively moved into and out of engagement.

709,691. CAR-HAUL. ALFRED H. ADELER, Pittsburg, Pa. Filed Feb. 13, 1902. Serial No. 94,073. (No model.)

Claim.—1. A device for moving or controlling the movement of cars, comprising an endless chain, so arranged that a portion of said chain will move the cars in one direction, while another portion is moving or controlling the movement of cars in the opposite direction, so that the cars traveling in one direction will move alongside of the cars traveling in the opposite direction, hinged or pivoted joints within the links to said chain to enable the same to conform to the different curves or courses in its movements, hooks on one side of said hinged or pivoted joints for engaging the cars moving in both directions, and wheels or rollers mounted on the opposite side of said hinged or pivoted joints and adapted to travel on tracks to support the chain in its movements.



2. A device for moving or controlling the movement of cars, comprising an endless chain, so arranged that a portion of said chain will move the cars in one direction, while another portion is moving or controlling the movement of cars in the opposite direction, so that the cars traveling in one direction will move alongside of the cars traveling in the opposite direction, hinged or pivoted joints within the links to said chain to enable the same to conform to the different curves or courses in its movements, hooks on one side of said hinged or pivoted joints for engaging the cars moving in both directions, and bearings on the opposite side of said hinged or pivoted joints having wheels mounted therein adapted to travel on tracks and support the chain in its movements.

3. A device for moving or controlling the movement of cars, comprising an endless chain, so arranged that a portion of said chain will move the cars in one direction, while another portion is moving or controlling the movement of cars in the opposite direction, so that the cars traveling in one direction will move alongside of the cars traveling in the opposite direction, hinged or pivoted joints within the links of said chain to enable the same to conform to the different curves or courses in its movements, hooks on one side of said hinged or pivoted joints for engaging the cars moving in both directions, and wheels or rollers mounted on the opposite side of said hinged or pivoted joints and adapted to travel on tracks to support the chain in its movements.

4. A device for moving or controlling the movement of cars, comprising an endless chain, so arranged that a portion of said chain will move the cars in one direction, while another portion is moving or controlling the movement of cars in the opposite direction, so that the cars traveling in one direction will move alongside of the cars traveling in the opposite direction, hinged or pivoted joints within the links of said chain to enable the same to conform to the different curves or courses in its movements, hooks on one side of said hinged or pivoted joints for engaging the cars moving in both directions, bearings on the opposite side of said hinged or pivoted joints and directly beneath the said hooks, and wheels or rollers mounted in said bearings and adapted to travel on tracks to support the chain in its movements.

5. A device for moving or controlling the movement of cars, comprising an endless chain, so arranged that a portion of said chain will move the cars in one direction, while another portion is moving or controlling the movement of cars in the opposite direction, so that the cars traveling in one direction will move alongside of the cars traveling in the opposite

direction, means on one of the links of said chain for engaging the cars moving in both directions, means for supporting the chain in its movements, and hinged or pivoted joints within the links of said chain containing the engaging means and between and in line with the engaging and supporting means to enable said chain to conform to the different curves or courses in its movements.

6. A device for moving or controlling the movement of cars, consisting of a single chain adapted to engage with cars for moving the same along an up-haul track and for moving or controlling the movement of the cars along a down-haul track, the portion of said chain carrying the last-named cars being substantially on the same inclined plane as the portion carrying the first-named cars, hinged or pivoted joints within the links of said chain to enable the same to conform to the different curves or courses in its movements, hooks on one of said hinged or pivoted joints for engaging the cars in both directions, and wheels mounted on said chain adjacent to the hinged or pivoted joints therein and traveling on tracks for supporting said chain in its movements.

7. A device for moving or controlling the movement of cars, consisting of a single chain adapted to engage the cars for moving the same along an up-haul track and for moving or controlling the movement of the cars along a down-haul track, the portion of said chain carrying the last-named cars being substantially on the same inclined plane as the portion carrying the first-named cars, hinged or pivoted joints within the links of said chain to enable the same to conform to the different curves or courses in its movements, hooks on one side of said hinged or pivoted joints for engaging the cars in both directions, and bearings on the opposite side of said hinged or pivoted joints having wheels mounted therein adapted to travel on tracks and support the chain in its movements.

8. As a new article of manufacture, a chain having some of its links provided with pivoted or hinged joints therein, the axes of which are at right angles to the hinged or pivoted joints connecting the ends of the links together, hooks on one side of said chain, and wheels mounted on the opposite side of said chain and directly beneath said hooks for traveling on tracks to support said chain.

9. As a new article of manufacture, a chain having some of its links provided with hinged or pivoted joints therein, the axes of which are at right angles to the hinged or pivoted joints connecting the ends of the links together, hooks on one side of said chain, and wheels mounted on the opposite side of said chain, said hooks and wheels being in line with said hinged joints.

10. As a new article of manufacture, a chain having some of its links provided with hinged or pivoted joints therein, the axes of which are at right angles to the hinged or pivoted joints connecting the ends of the links together, and extensions on the ends of said connecting-links adapted to bear on said hinged or pivoted links to support the same.

709,692. OVERHEAD TRAMWAY. ALFRED M. ACKLIN, Pittsburg, Pa. Filed Feb. 27, 1902. Serial No. 95,950. (No model.)

Claim.—1. An overhead tramway comprising a single or main rail or track, two trolley-frames carrying buckets adapted to be moved in both directions on said rail or track, and an auxiliary rail vertically above said main rail or track adapted to engage with one of said trolley-frames to enable it to pass the other trolley-frame at a given point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

2. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track and at one side of the same at the passing-point for engaging with one of said trolley-frames to enable it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

3. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track at the passing-point, and another set of wheels on one of said trolley-frames adapted to engage with said auxiliary rail to enable it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

4. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track and at one side of the same at the passing-point, and another set of wheels on one of said trolley-frames adapted to engage with said auxiliary rail to enable it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

5. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track at the passing-point having downwardly-inclined ends thereon, and another set of wheels on one of said trolley-frames adapted to engage with said auxiliary rail to enable it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

6. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track and at one side of the same at the passing-point having downwardly-inclined ends thereon, and another set of wheels on one of said trolley-frames adapted to pass up said inclined ends to raise said trolley-frame from engagement with the main rail or track and permit it to pass the other trolley-frame at the said passing-point.

7. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track at the passing-point, and another set of wheels on one of said trolley-frames and above the first-named wheels, said second-named wheels being adapted to engage with said auxiliary rail to enable it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

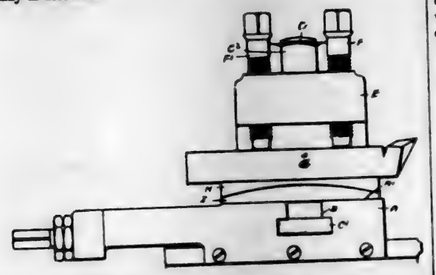
8. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track and at one side of the same at the passing-point, and another set of wheels on one of said trolley-frames and above the first-named wheels, said second-named wheels being adapted to engage with said auxiliary rail to enable it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

9. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track at the passing-point having downwardly-inclined ends thereon, and another set of wheels on one of said trolley-frames and above the first-named wheels, said second-named wheels being adapted to pass up said inclined ends to raise said trolley-frame from engagement with the main rail or track and permit it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

10. An overhead tramway comprising a single or main rail or track, two trolley-frames having wheels thereon adapted to engage with the main rail or track and be moved along the same in both directions, an auxiliary rail vertically above said main rail or track and at one side of the same at the passing-point having downwardly-inclined ends thereon, and another set of wheels on one of said trolley-frames adapted to pass up said inclined ends to raise said trolley-frame from engagement with the main rail or track and permit it to pass the other trolley-frame at the said passing-point, one of said trolley-frames being adapted to travel on both the main and auxiliary rails, and both ends of said auxiliary rail being adapted to lift one of the trolley-frames from the main rail.

709,693. TOOL-POST. JOHN R. BACK, Worcester, Mass., assignor to the F. H. Reed Company, Worcester, Mass., a Corporation of Massachusetts. Filed Oct. 13, 1897. Serial No. 655,011. (No model.)

Claim.—1. The combination of a tool-rest having a plane upper surface and provided with a T-shaped slot, a post resting upon said tool-rest and having on one side a projecting flange resting upon the tool-rest and on its opposite side a lug overhanging said tool-rest, said flange and lug being disposed in the same direction as said tool, a clamping-screw held in said lug whereby a tool resting upon the tool-rest is held in position, a bolt extending vertically through said post and having an elongated head also in the direction of the T-slot and inclined in said slot, substantially as described.



2. The combination of a tool-rest having a plane upper surface and provided with a T-shaped slot, a post resting upon said tool-rest and having on one side a projecting flange resting upon the tool-rest and upon the opposite side a lug overhanging the tool-rest, a clamping-screw held in said lug, blocks having oppositely-curved surfaces in contact and resting upon the upper surface of the tool-rest and beneath the clamping-screw in order to support the tool and permit the same to be tilted, substantially as described.

709,694. DRAW-OFF OR STRETCHING ROLLERS FOR TEXTILE MACHINERY. ALFRED BUTTENSCHÖN, Hammerstiel, Germany. Filed July 28, 1901. Serial No. 69,346. (No model.)

Claim.—1. Draw-off or stretching rollers, provided with fluted surfaces, and elastic cushion-strips bedded in said rollers, said flutes forming sharp edges which are adapted to mesh with said elastic cushion-strips, substantially as set forth.

2. Draw-off or stretching rollers, provided with fluted surfaces forming sharp edges, and elastic cushion-strips bedded in the flutes of said rollers, and having central longitudinal grooves in their exposed surfaces, said sharp edges adapted to mesh with said grooves, substantially as set forth.

709,695. METAL FASTENING FOR CROSS-WIRES. BYRON S. BLAKE, Rochester, N. Y. Filed Mar. 7, 1902. Serial No. 97,201. (No model.)

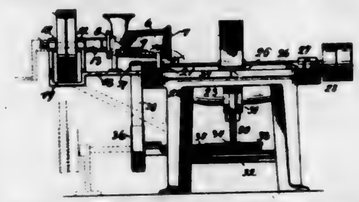
Claim.—The fastener for wire-supports herein described, consisting of a strip of spring-wire formed near one end with a transverse loop and near the other end with a rounded and constituting an open loop to engage the stake, said fastener having two substantially parallel straight portions of different lengths, the shorter portion being extended along the longer portion and having its terminal intermediate said loops and its free end bent out of the plane of the longer portion and terminating in a backturned hook to form a stop for the string-wire all substantially as and for the purpose specified.

709,696. RADIANT-HEAT BATH. GEORGE BRUSH, New York, N. Y. Filed Mar. 13, 1902. Serial No. 97,941. (No model.)

Claim.—1. In a radiant-heat bath, the combination of an exterior polygonal casing having an opening in one of its sides, a plurality of hinged outwardly-swinging doors, one above the other, for closing said opening, two vertical rows of incandescent electric lamps arranged on said side of the casing, one row at each side of the doors, reflectors for throwing the light from said lamps inwardly into the casing, and an electric-arc lamp adjustably supported outside of said casing and provided with a reflector for throwing the rays of light therefrom through said openings, substantially as set forth.

2. In a radiant-heat bath, the combination, of an upright casing of regular polygonal cross-section having alternate sides provided with extended portions at a suitable height and in communication with the interior of the casing, interior rows of incandescent lamps arranged vertically along the edges of the intermediate sides, interchangeable screen devices for said extended portions, sources of light in said extended portions, one of said intermediate sides forming an entrance-door, and another intermediate side having a plurality of vertically-arranged doors adapted to open independently for the admission of light from an exterior source, substantially as set forth.

709,697. HEAT-REDUCING DEVICE. HENRY C. CHAMBERS, Cincinnati, Ohio, assignor to the Cincinnati Butchers Supply Co., Cincinnati, Ohio. Filed Mar. 15, 1902. Serial No. 98,276. (No model.)



Claim.—The combined attaching-plate and supporting-base whereby in a meat-reducing device consisting of a preliminary and a finishing cutter, the first cutter is supported and attached to the second cutter, said combined plate and base disposed in a horizontal direction and adapted for attachment at one end to the finishing-cutter and having at its other end a frame 19 which is provided with bearings 12, 12, adapted to support the driving-shaft of the preliminary cutter.

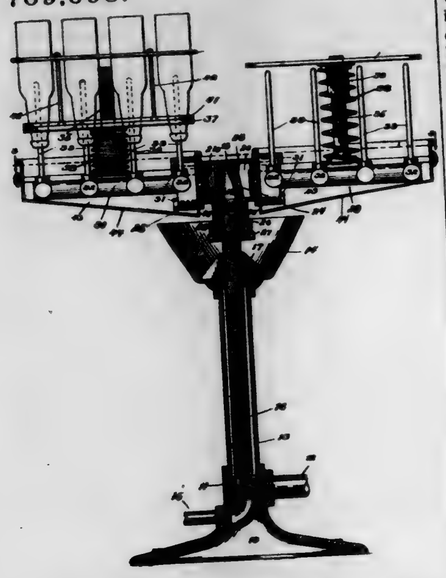
709,698. BOTTLE-RINSER. HARRY W. OSLEY and HENRY O. HEINEMANN, Chicago, Ill. Filed Apr. 12, 1902. Serial No. 102,888. (No model.)

Claim.—1. In a bottle-rinsing machine, the combination of two series of vertical rinsing-tubes mounted to rotate upon a water communication having a central valve-seat, said valve-seat being mounted in turn upon a valve-plug, the latter being carried by a vertical water-supply pipe, and a stuffing-box connecting the valve-seat and the vertical supply-pipe, substantially as specified.

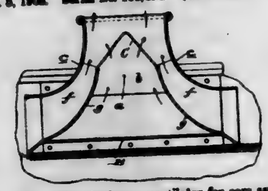
2. In a bottle-rinsing machine, the combination of two series of vertical rinsing-tubes mounted to rotate upon a water communication having a central valve-seat, said valve-seat being mounted in turn upon a valve-plug, the latter being carried by a vertical water-supply pipe, a stuffing-box connecting the valve-seat and the vertical supply-pipe, a drainage-pan rotating with the rinsing-tubes and a stationary bowl beneath to receive the said drainage, substantially as specified.

3. In a bottle-rinsing machine, the combination of two series of vertical rinsing-tubes mounted to rotate on a water communication, each series being provided with a platform for centering and supporting a multiplicity of bottles, and each platform being mounted upon a spring depressed by the weight of the bottles, and a bottle-carrier for spacing the multiplicity of bottles, substantially as specified.

709,698.

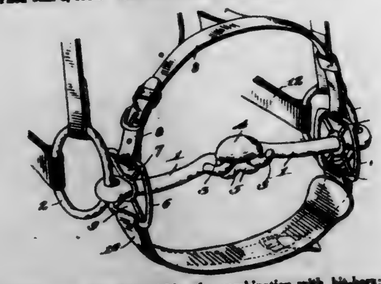


709,699. VENTILATOR. WILLIAM T. COTTIER, Chicago, Ill. Filed Apr. 8, 1902. Serial No. 101,494. (No model.)



Claim.—In a suction device or ventilator for cars and the like, the combination with an upright, hollow body open at its upper end, and having lateral, inwardly and upwardly extending air-inductors, the upper ends of the inner walls of which are disposed in the same horizontal plane; of an upwardly-bulged screen arranged in the body over the space between the inner walls of the inductors and connected at its edge to the upper ends of said inner walls, whereby it is adapted to shed cinders, dirt and the like into the air-inductors, and the currents of air passing upwardly through said inductors are enabled to prevent the collection of dust on the screen.

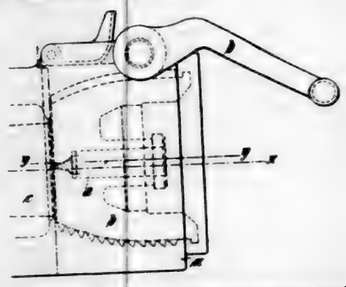
709,700. BRIDLE-BIT. CHARLES W. DROWN, Brattleboro, Vt. Filed Jan. 9, 1902. Serial No. 88,861. (No model.)



Claim.—1. In a jointed bit; the combination with bit-bars; of a center bit-roll with which said bars are connected at their inner ends; stops on said bit-roll against which the said bit-bars impinge so as to prevent breaking of the bit at the joint in a downward direction, but leaving it free to break in other directions, whereby a straight bit rigid against downward pressure is provided; cheek-plates slidingly mounted on said bit-bars, an adjustable lower jaw-strap secured to the lower ends of said cheek-plates; and an adjustable upper jaw-strap and cheek-rein secured to the upper ends of said cheek-plates.

2. A jointed bit comprising bit-bars; and a center bit-roll to which said bit-bars are jointed, said bit-roll having a flat bottom or under side and centrally-placed eyes depending therefrom to form joint connections for the bit-bars; said bit-bars impinging against said flat bottom so as to prevent breaking the bit downwardly, but leaving it free to break in other directions.

709,701. FIRING-PIN ARRANGEMENT FOR BREECH-LOADING ORDNANCE. GUSTAV BERNARDT, Eisenach, Germany. Filed Apr. 3 1902. Serial No. 101,379. (No model.)



Claim.—1. A breech-closing mechanism in which the breech-block is arranged eccentric of the bore and secured in operative relation thereto by an interrupted thread, and a firing-pin arranged eccentrically in the breech-block.

2. A breech-closing mechanism in which the breech-block is unlocked by a rotary movement and opened to the rear and in which the axis of the breech-block is arranged eccentrically to the bore and the firing-pin eccentrically to the breech-block, and in such relation that the firing-pin shall coincide with the axis of the bore when the breech-block is locked in operative position.

3. A breech-closing mechanism in which the breech-block is mounted for limited rotative and retractive movement eccentrically of the bore, and the firing-pin mounted eccentrically on the breech-block and in such relation thereto that the axis of its rotative movement shall cut the longitudinal axis of the bore when the breech-block is in locked position.

4. In a breech-closing mechanism, a breech-block mounted eccentrically of the bore, means for locking and unlocking the breech by a limited rotative movement, means for retracting and advancing the breech-block, and a firing-pin arranged eccentrically in the breech-block in such relation thereto that the pin shall coincide with the bore when the breech-block is in the locked position.

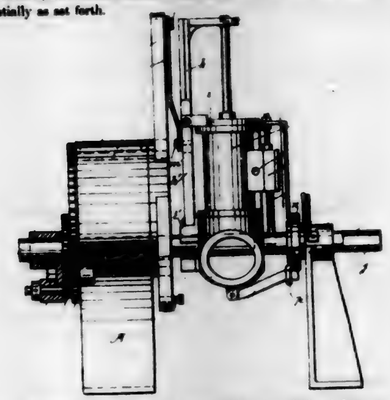
5. In a breech-closing mechanism, an eccentrically-arranged breech-block adapted to be locked and unlocked by a limited rotative movement and to be opened and closed by swinging pivotally as upon a hinge, and a firing-pin arranged eccentrically in the breech-block in such relation thereto that the arc of movement of the pin shall intersect the longitudinal axis of the bore when the breech-block is in locked position.

709,702. ROTARY ENGINE. BYRON W. FELLOWS, Beverly, Mass. Filed June 21, 1901. Renewed May 28, 1902. Serial No. 109,380. (No model.)

Claim.—1. The combination, with a main bearing, and a sleeve journaled in it and provided with projecting arms; of an engine-shaft journaled eccentric of the said sleeve, power-cylinders mounted on the said shaft and operatively connected with the said arms whereby the said sleeve is revolved, and toothed wheels connecting the said shaft and sleeve and constraining them to revolve at the same speed and in the same direction, substantially as set forth.

2. The combination, with a main bearing, and a sleeve journaled in it and provided with projecting arms; of power-cylinders secured to the said shaft and provided with piston-rods, guides arranged alongside the said cylinders, cross-heads secured to the piston-rods and provided with slides which work in the said guides, and connecting-rods between the said slides and the projecting arms, substantially as set forth.

3. The combination, with a main bearing, and a sleeve journaled in it and provided with projecting arms; of an engine-shaft journaled eccentric of the said sleeve and provided with an axial steam-passage, power-cylinders provided with steam-chests and mounted on the said shaft, steam-pipes connecting the said steam-chests with the said passage in the shaft, connections between the said cylinders and arms whereby the said sleeve is revolved, and toothed wheels connecting the said shaft and sleeve, substantially as set forth.



4. The combination, with a revolvable engine-shaft, of three power-cylinders secured to the said shaft and provided with valve-spindles, an eccentric mounted on the said shaft and provided with a single eccentric-strap, means for preventing the said eccentric from revolving with the engine-shaft, a jointed driving device which connects the said eccentric-strap with the said shaft so that the strap is revolved by the shaft, and eccentric-rods operatively connecting the said eccentric-strap with the valve-spindles, substantially as set forth.

5. The combination, with a revolvable engine-shaft, of three power-cylinders secured to the said shaft and provided with valve-spindles, an eccentric mounted on the said shaft and provided with a single eccentric-strap, eccentric-rods operatively connecting the said eccentric-strap with the valve-spindles, a jointed driving device which connects the said eccentric-strap with the said shaft so that the eccentric may be moved to reverse the engine and so that the said eccentric-strap is revolved by the said shaft, a reversing-lever secured to the eccentric, a stationary quadrant, and a catch for connecting the said lever and quadrant, substantially as set forth.

6. The combination, with a revolvable engine-shaft, of three power-cylinders secured to the said shaft and provided with valve-spindles, an eccentric mounted on the said shaft, means for preventing the eccentric from revolving with the engine-shaft, an eccentric-strap provided with a projecting loop, an arm pivotally connected with the shaft and engaging with the said loop whereby the eccentric-strap is constrained to revolve with the shaft, and eccentric-rods operatively connecting the said eccentric-strap with the valve-spindles, substantially as set forth.

709,703. CARBURETER. THOMAS J. FORBS, Geneva, Ohio. Filed Mar 18, 1902. Serial No. 98,714. (No model.)

Claim.—1. In a gas-carbureting apparatus, a generating-coil, a generating-base on which said coil is supported having a valve-controlled gas-duct open to said coil, a main to which the gas flows from the coil and a mixer at the opening for the gas into the said main, substantially as described.

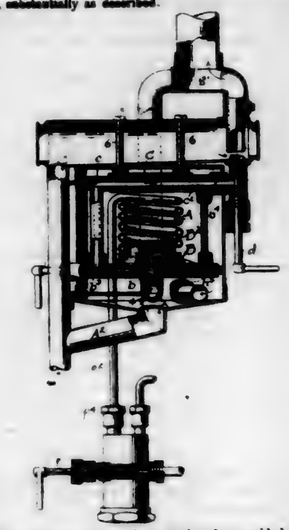
2. A generating-coil for hydrocarbon gas and a generating-base supporting said coil having a plurality of gas-outlets, a burner on said base at the bottom of said coil and a valve for each of said outlets, substantially as described.

3. The generator-coil and the base on which it is removably secured, a cap over said coil and a conduit connecting said base and cap, and a main to which the gas flows from said base, substantially as described.

4. The generator-base and a generator-coil detachably supported thereon and open thereto, a cap over the coil and a gas-duct therein and a conduit-support for the cap rising on said base and open to the duct therein and to the said cap, substantially as described.

5. The generator-base and the generator-coil open thereto, a cap over the coil supported on said base, and a gas-conduit from the said base through said cap, in combination with a main to which the gas is delivered, and a valve-controlled connection from the duct in said cap to said main to deliver the gas, substantially as described.

6. The generator-base and the generator-coil open thereto, the casing about the said parts having a depressed bottom, and a drain-pipe from said bottom, substantially as described.

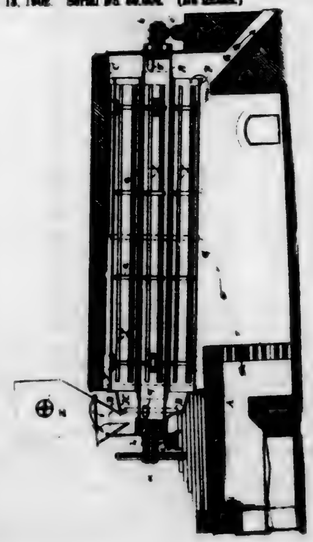


7. The generator-coil and the base therefor provided with a vapor-duct open to said coil, a vaporizing device for the oil and a tube leading therefrom and having a burner at its extremity beneath said base, whereby the said base is initially heated, substantially as described.

8. The combination of the generator-base, and generator-coil thereon and open thereto and a burner on said base within the lower portion of the coil, a cap over the coil and a duct from said base through said cap, an air-supply tube over said cap, a mixer therein and a valve controlling said duct and opening into said mixer, substantially as described.

9. The generator-base and the coil in open connection therewith and the burner on said base, in combination with a valve-controlled duct from base, and a return-pipe arranged to discharge a portion of the outgoing gas through said duct to the burner on said base, substantially as described.

709,704. ROTARY DRIER. LEVI GRILL, Cleveland, Ohio. Filed Jan. 13, 1902. Serial No. 89,804. (No model.)



Claim.—1. In a power-operated drier, the combination of a rotating central tube and a plurality of flues moved by said central tube, all communicating with a hopper for receiving their charges as shown, and for the purpose described.

2. In a power-operated drier, comprising a central tube and a plurality of auxiliary tubes, all being connected as shown, the center tube terminating in trunnions and having side openings for the passage of material therethrough.

3. In a drier, in combination, a central drying-tube rotatively mounted, and a plurality of exterior drying-tubes positioned relative to and rotatable with said central tube and forming a unitary structure therewith.

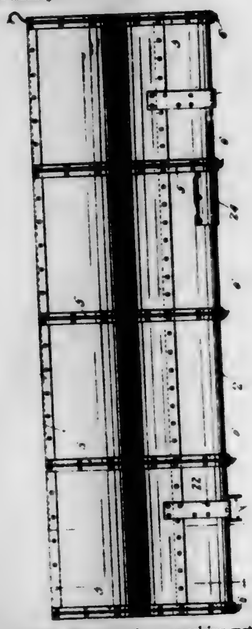
4. In a power-operated drier, in combination, a furnace, and a series of rotatable flues for the passage of gases from said furnace, said flues being combined to form a unitary structure and forming independent drying-chambers, one of said flues forming the support for the remaining flues.

5. In a drier, in combination, a plurality of flues mounted in rotating heads to form a unitary structure, one of said flues forming the support for said heads.

6. In a drier, in combination, a plurality of rotating drying-tubes connected by rotating heads, one of said tubes forming the support for said heads, a hopper, and means for feeding the material from the hopper to said tubes.

7. In a drier, a furnace, a fan, and a plurality of flues mounted in rotating heads to form a unitary structure, one of said flues forming the support for said heads, said flues forming the sole passage-way leading to said fan, whereby the gases will be drawn through each tube in the same direction.

709,705. **METALLIC WAGON-BOX.** WALLACE GROSVENOR and WILLIAM MILNER, Canonton, N. D. Filed May 3, 1902. Serial No. 105,719. (No model.)



Claim.—1. A metallic wagon-box comprising metallic side plates, channel-like bottom plates, and flat end plates, in combination with sectional metallic ribs secured to said side and bottom plates and connecting the same and joint-irons connecting the abutting ends of the rib-sections, substantially as described.

2. A metallic wagon-box comprising the bent side plates 1, channel-shaped bottom plate 2 and flat end plates 3 and 4, in combination with the sectional ribs 5 secured to said plates 1 and 2, and the channel-shaped couplings 6 embracing and riveted to the flanges of said ribs 5, at their abutting ends, substantially as described.

3. A metallic wagon-box comprising the side plates 1, channel-like bottom plate 2 and end plates 3 and 4, in combination with the ribs 5 and 7 connecting the said plates 1 and 2 together and said ribs 7 being riveted to said end plates, and the coupling-channels 6 riveted to the flanges of said ribs 5, at their abutting ends, substantially as described.

4. A metallic wagon-box having metallic side and end plates and metallic ribs and reinforcing angle-irons secured to the upper edges of the side and end plates with their flanges projecting inward over the upper end of the box and serving as wind-guards, substantially as described.

709,706. **UNCOUPLING MECHANISM FOR RAILWAY-CARS.** GEORGE GROOBEY, Chicago, Ill. Filed Nov. 8, 1901. Serial No. 81,619. (No model.)

Claim.—1. A guide-plate for cars, having two pairs of sheaves revolubly supported thereon, the sheaves of each pair being disposed at an angle to each other.

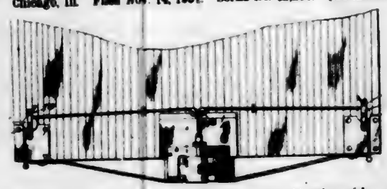
2. The combination with a car-coupling, an uncoupling device, and a head block, of a guide-plate having two sets of guide-sheaves disposed in pairs at an angle to each other, a flexible connection rove over one or both sheaves of either pair of guide-sheaves, said connection adapted to be attached at one end to the uncoupling device of the coupler, and means for fastening the opposite end of the flexible connection.

3. The combination with an uncoupling device, of a car-coupling, and a flexible connection, of a locking-plate having an inverted-L-shaped slot, the horizontal portion of which has means for fastening the connection.

4. The combination with an uncoupling device, of a car-coupling, and a flexible connection, of a locking-plate having an inverted-L-shaped slot with two notches in different horizontal planes to lock the connection.

5. The combination with a car-coupling, and an uncoupling device, of a guide-plate having two sets of guide-sheaves disposed in pairs at an angle to each other, a flexible connection rove over one or both sheaves of either pair of guide-sheaves, said connection adapted to be attached at one end to the uncoupling device of the coupler, and means for fastening the opposite end of the flexible connection.

709,707. **MEANS FOR UNCOUPLING CARS.** GEORGE GROOBEY, Chicago, Ill. Filed Nov. 14, 1901. Serial No. 82,266. (No model.)



Claim.—1. In uncoupling mechanism, the combination with a guide-plate, and a sheave-block adjustably connected therewith and carrying sheaves, of a flexible connection adapted to extend over said sheaves in opposite directions to the sides of the cars.

2. The combination with a guide-plate, and a sheave-block, adjustably connected therewith and carrying sheaves, of a flexible connection adapted to extend over said sheaves in opposite directions to the sides of the cars, and means for locking said connection or connections.

3. The combination with a grooved plate having notches therein, of a sheave-block having a lug adapted to enter one of said notches, and a bolt and nut for securing the block to the plate.

4. The combination with a grooved plate having notches therein, of a sheave-block having a lug adapted to enter one of said notches, and a bolt and nut for securing the block to the plate, said sheave-block carrying a pair of sheaves at an angle to each other, and flexible connection extending over said sheaves.

5. The combination with an uncoupling device, and a flexible connection extending therefrom, of a locking-sheave over which said connection passes, said sheave mounted both to turn and move endwise on its support or bearing, and means for locking the sheave.

6. The combination with an uncoupling device, and a flexible connection extending in opposite directions therefrom, of an adjustable sheave-block, a pair of locking-sheaves, having rosettes of teeth thereon, housing

having similar teeth thereon and keys or wedges for locking the sheaves to the housings.

7. The combination with a guide-plate having an undercut groove extending lengthwise thereof, and notches in said plate, of a sheave-block having a lug adapted to enter one of said notches, a bolt the head of which is fitted to the groove and the opposite end of which passes through the groove and block, a nut adapted to screw on the bolt to fasten it in place to clamp the block, and a flexible connection adapted to extend over said sheaves to the device to be operated.

8. In uncoupling mechanism, the combination with a guide-plate, of a sheave-carrying plate having a pair of sheaves journaled thereon, said plate capable of several adjustments upon said guide-plate whereby to bring the adjacent points of the sheaves in line with the uncoupling device of different types of car couplings.

9. The combination with a car, uncoupling means thereon, and a block adjustably connected widthwise of or across the car, and adapted to be located in line with the uncoupling means, said block carrying sheaves, of a flexible device connected with the uncoupling means, thence extended upwardly over a sheave on the block and finally to an edge of the car within easy reach of the trainman.

10. In an uncoupling mechanism, the combination with a guide-plate having a groove extending longitudinally thereof, a block, and means extending through the block into the groove by which the block is adjustable lengthwise of the groove, and a flexible device connected with the uncoupling means, thence extended to the block and finally to an edge of the car within easy reach of the trainman.

709,708. **UNCOUPLING MECHANISM FOR RAILWAY-CARS.** GEORGE GROOBEY, Chicago, Ill., and SAMUEL P. DUNN, Columbus, Ohio. Filed Dec. 2, 1901. Serial No. 84,653. (No model.)

Claim.—1. A guide-plate for railway-cars, comprising a housing-plate having sheaves journaled thereon, a flexible connection extending from the coupling mechanism over one of said sheaves, and means for guiding said connection located at the forward edge of the plate and upon which said connection bears, said means being of sufficient extent with respect to the coupling used so that some part of it is always in line with the uncoupling mechanism of any known car-coupling of the Janney type.

2. A guide-plate for railway-cars, having an elongated antifriction-roller journaled at its forward edge, sheaves journaled on the plate in approximately the same plane with the elongated roller, and flexible connections extending from the coupling mechanism over the roller and around two of the sheaves.

3. A guide-plate for railway-cars, having an elongated antifriction-roller journaled at its forward edge, sheaves housed in the plate in approximately the same plane with the roller, said plate having openings at its opposite ends rearward of the sheaves, and flexible connections extending from the coupling means over the antifriction-roller and around two of the sheaves and out through the opening or openings in the ends of the plate.

4. A guide-plate for railway-cars, having two outer sheaves, an intermediate sheave and an elongated antifriction-roller disposed at the edge thereof, said sheaves and roller located in substantially the same plane and adapted to form guides for a flexible uncoupling device.

5. The combination with a guide-plate having sheaves journaled thereon and an elongated antifriction-roller journaled on said plate, of an uncoupling device, flexible connections extending therefrom over the roller and two of the sheaves to opposite sides of the car, and means for fastening the flexible connections, said means consisting of a plate having an opening through which the connection passes, and a gravity-latch operating in conjunction therewith for locking the connection.

6. The combination with a plate having guiding means at its forward edge, of a pair of horizontally-disposed sheaves adjustably connected with the plate, and a flexible connection which passes between said sheaves.

7. The combination with a plate having guiding means at its forward edge, of a pair of sheaves disposed horizontally and adjustable endwise of the plate, and flexible connections extending between said sheaves.

709,709. **SHOW-CASE.** SOLOMON HIRSH, Baltimore, Md. Filed Apr. 29, 1902. Serial No. 105,169. (No model.)

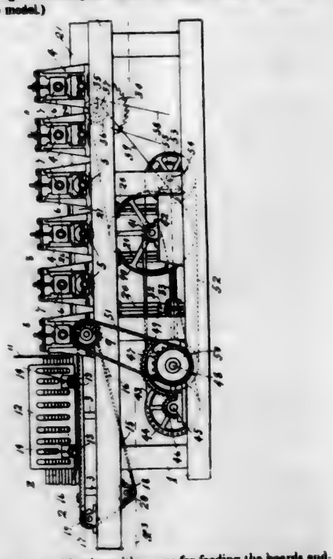
Claim.—1. In a glass show-case the combination of two glass plates: a strip having a channel at one side and a flat surface at the opposite side, said channel receiving the edge of one plate and the opposite flat surface of said strip abutting against the inner side surface of the adjoining plate and having one or more tangs projecting from the flat surface of said strip and parallel with the side surface of said adjoining plate, and a bolt passing through said tang and securing the last-named plate against the flat surface of said strip.

2. In a glass show-case the combination of corner-posts; vertical glass plates abutting against said corner-posts; a top glass plate; horizontal top strips having a channel and a flat surface opposite said channel, the channel of said strips taking over the upper edges of the vertical plates, and said strips provided with tangs flush with and projecting from the said flat surface and contacting with the bottom surface of the top plate, and means for securing said top plate to said tangs.

3. In a glass show-case the combination of two glass plates; a metal strip having a channel and a flat surface opposite said channel, the channel of said strip receiving the entire edge of one glass plate and the flat surface of said strip abutting against the side surface of an adjoining glass plate and two sets of tangs projecting from said metal strip at an angle with respect to each other, one set of tangs extending parallel and flush with one plate and the other set of tangs extending parallel and flush with the other plate.

4. In a glass show-case the combination of two glass plates; a strip having a channel at one side and a flat surface at the opposite side, said flat-surfaced side also being provided with one or more dovetailed grooves; a dovetailed tang fitted in each of said grooves and projecting laterally therefrom whereby the channel of said strip will receive the edge of one plate and the flat surface and tangs of said strip will abut against the side surface of the adjoining plate.

709,710. **MACHINE FOR FORMING BLANKS FROM MATCHED BOARDS.** CHARLES JOHNSON, Minneapolis, Minn., assignor of one-half to Arthur R. Rogers, Minneapolis, Minn. Filed Apr. 15, 1902. Serial No. 102,973. (No model.)



Claim.—1. The combination with means for feeding the boards endwise, of means for pressing the boards together edgewise, to unite the

joints thereof, involving a plurality of hammers, means for setting said hammers under strain, and means for suddenly releasing them to render the same operative, substantially as described.

2. The combination with means for feeding the boards endwise, of means for pressing the boards together edgewise to unite the joints thereof, involving a plurality of independently-pivoted hammers, means for setting said hammers under strain and means for suddenly releasing them, to render the same operative substantially as described.

3. The combination with means for feeding the boards endwise, of means for pressing the boards together edgewise to unite the joints thereof, involving a plurality of independently-pivoted presser-hammers, a spring operating independently on each hammer and tending to render the same operative, and means for moving said hammers into retracted positions against the tension of the springs and then suddenly releasing the same, substantially as described.

4. The combination with means for feeding the boards endwise, of means for pressing the boards together edgewise to unite the joints thereof, involving a plurality of presser-hammers 24 independently pivoted at 25 and provided with hammering-heads 26 beveled at 25°, springs 27 independently connected to said hammers 24, and tappets 32 operating one on each hammer 24 and serving to move the same against their springs 27 then to suddenly release the same, substantially as described.

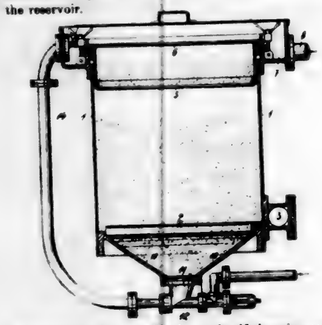
709,711. **WRENCH.** RALPH JOHNS, Allegheny, Pa. Filed June 27, 1902. Serial No. 113,535. (No model.)

Claim.—In a wrench, the combination with a fixed jaw, a rack-bar rigidly secured thereto, a movable jaw, an extension formed to said movable jaw having approximately U-shaped guideways, a block having a seat formed therein, extensions carried by said block operating in said guideways, a plate detachably secured to the said movable jaw inclosing the outer ends of said guideways, and a spring arranged in said seat bearing against the inner face of said plate, all parts being arranged and operating substantially as described and for the purpose set forth.

709,712. **FILTER.** JOSEF KONÁLEK, Prague-Vinohrady, Austria-Hungary, assignor to Society Maschinenbau-Actiengesellschaft vormals Breitfeld, Danek & Co., Akciová Spolecnost Strojirny Drive Breitfeld, Danek I Spol., Karlin, Bohemia, Austria-Hungary. Filed Apr. 19, 1902. Serial No. 103,690. (No model.)

Claim.—1. The combination in a filtering apparatus, of a reservoir, 1, a filtering medium practically filling such reservoir, a horizontal, or nearly horizontal layer of tubes, 2, extending over practically an entire horizontal area of the reservoir, and which have slits or openings their whole length inside the reservoir, preferably located at the bottom of the individual tubes, and a gutter exterior to, immediately below, and surrounding the upper rim of the reservoir for the reception of the clarified liquid falling over said rim.

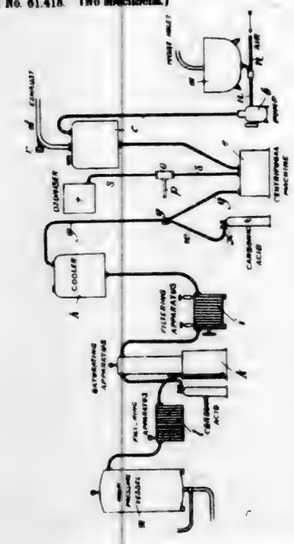
2. The combination in a filtering apparatus, of a reservoir, 1, a filtering medium practically filling such reservoir, a horizontal, or nearly horizontal layer of tubes, 2, extending over practically an entire horizontal area of said reservoir, and which have slits or openings their whole length inside the reservoir, preferably at the bottom of the individual tubes, a series of horizontal sieve-partitions in the reservoir above the layer of tubes, and a gutter outside of, below, and surrounding the upper rim of the reservoir.



3. The combination in a filtering and self-cleansing apparatus, of a reservoir, 1, a filtering medium practically filling the same, a layer of perforated tubes for introducing the liquid to be filtered into said filtering medium, a gutter outside of, below, and surrounding the upper rim of the reservoir, a draw-off pipe leading therefrom, funnels formed in the bottom of said reservoir and having discharge-openings at their apexes, water-injectors beneath each of said openings and into which the openings discharge, and return-pipes leading from said injectors to the top of the reservoir to discharge the mingled sand and water therein.

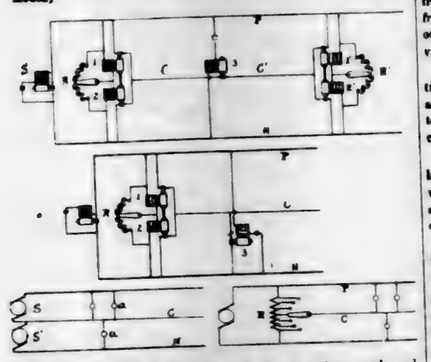
4. The combination in a filtering and self-cleansing apparatus, of a reservoir, 1, a filtering medium practically filling the same, a layer of perforated tubes for introducing the liquid to be filtered into said filtering medium, a gutter outside of, below, and surrounding the upper rim of the reservoir, a draw-off pipe leading therefrom, removable sieve-partitions extending horizontally across the reservoir, funnels formed in the bottom of said reservoir and having discharge-openings at their apexes, water-injectors beneath each of said openings and into which the openings discharge, and return-pipes leading from said injectors to the top of the reservoir to discharge the mingled sand and water therein.

709,713. **PROCESS OF MANUFACTURING NON-ALCOHOLIC BEER.** VALENTIN LAPP, Lindenau, Germany. Filed May 22, 1901. Serial No. 61,418. (No specimens.)



Claim.—The method of manufacturing non-alcoholic beer, consisting in heating wort, ventilating it by means of pure air, saturating it with ozone, adding carbonic acid having a tension of about ten atmospheres, cooling the wort while being under that pressure, filtering it and relieving it at the same time from part of said pressure, saturating it with carbonic acid, filtering it again, and storing the thus-obtained product under a carbonic-acid pressure of ten atmospheres until the bottling or racking-off.

709,714. **METHOD OF CONTROLLING THE ENERGY DELIVERED TO ELECTRICAL TRANSLATING DEVICES.** HARRY W. LEONARD, East Orange, N. J. Filed Jan. 31, 1896. Serial No. 577,590. (No model.)



Claim.—1. The method of reversing the direction of current through a translating device, consisting in connecting the terminals of the translating device with two conductors of constant but different potential, developing an electromotive force between the translating device and one of the said conductors, and varying the said electromotive force so that the potential at one terminal of the translating device can be made higher or lower than the potential at the other terminal, whereby the current through the translating device will be reversed.

2. The method of reversing the direction of current through a translating device, consisting in connecting the terminals of the translating device between two conductors which are electrically connected with a source of electromotive force, and varying by magnetic induction the relative potential of the two conductors independent of and without altering the connections with the source so that the potential of one of them is made to become higher or lower than that of the other, whereby the current through the translating device is reversed.

3. The method of reversing the direction of rotation of an electric motor, consisting in connecting the terminals of the motor-armature between two conductors which are electrically connected with a source of electromotive force, and varying the relative potential of the two conductors independent of and without altering the connections with the source so that the potential of one of them is made to become higher or lower than that of the other, whereby the current through the motor-armature is reversed.

4. The method of controlling the energy delivered to a translating device, consisting in connecting the terminals of the translating device between two conductors which are electrically connected with a source of electromotive force, varying by magnetic induction the potential upon either or both of said conductors to vary the electromotive force at the terminals of said translating device, and varying the potential upon said conductors so that the potential upon either of them may be made to become higher or lower than the potential upon the other conductor, whereby the current through the translating device may be reversed.

5. The method of controlling the energy delivered to an electric motor, consisting in connecting the armature-terminals of the motor between two conductors which are electrically connected with a source of electromotive force, varying by magnetic induction the potential upon either or both of said conductors to vary the electromotive force at the armature-terminals of said motor, and varying the potential upon said conductors so that the potential upon either of them may be made to become higher or lower than the potential upon the other conductor, whereby the current through the motor-armature will be reversed.

6. The method of reversing the direction of current through a translating device, consisting in connecting the terminals of the translating device with the terminals of a source of electromotive force and developing in series with the translating device between it and the source by means of a second source of electromotive force, a variable counter electromotive force which can be varied from an electromotive force lower than the effective electromotive force in the circuit of the translating device to an electromotive force higher than the effective electromotive force in the circuit of the translating device, or vice versa, whereby the direction of the current through the translating device is reversed.

7. The method of reversing the direction of current through a translating device consisting in developing between the source and the translating device, an electromotive force counter to that of the source and varying that electromotive force so that the current through the translating device is reversed.

8. The method of reversing the direction of current through a translating device connected in a circuit in which there are two opposing electromotive forces which consists in varying one of the electromotive forces from an amount below to an amount above the electromotive force of the other, whereby the direction of the current through the translating device is reversed.

9. The method of reversing the direction of current through an electric motor-armature consisting in developing in the circuit of the motor-armature in series with it and the source, an electromotive force counter to that of the source, and which can be varied over a range sufficient to cause the current through the motor-armature to reverse.

10. The method of reversing the direction of current through a translating device, consisting in developing in series with the translating device and the source two independent electromotive forces and varying said two electromotive forces relative to each other to cause the direction of current through the translating device to reverse.

11. The method of reversing the current through a translating device connected between two conductors of variable potential, consisting in supplying to said conductors currents of variable potential by means of two independent sources of electromotive force which are electrically connected together, and varying the potential upon one of said conductors from a potential less than, to a potential greater than the potential of the other conductor, or vice versa.

12. The method of reversing the current through a translating device connected between two constant potentials, consisting in developing two variable potentials intermediate the first-named potentials and electrically connected therewith and connecting the translating device between these two points of intermediate potential and then varying the potential of said intermediate potentials relative to each other until they are equal and then continuing the relative variation, whereby the current is reversed.

13. The method of varying the current through a translating device consisting in developing in series with a source and the translating device, an electromotive force counter to the electromotive force of the source and variable from an amount less than the electromotive force of the source to an amount greater than that of the source.

14. The method of varying the current through the armature of an electric motor, consisting in developing in series with a source and said armature, an electromotive force counter to the electromotive force of the source and variable from an amount less than the electromotive force of the source to an amount greater than that of the source.

15. The method of reversing the current through a translating device consisting in producing two divided sources of electromotive force and connecting the translating device between the two points of division and then varying the potential at the points of division relative to each other to reverse the current through the translating device.

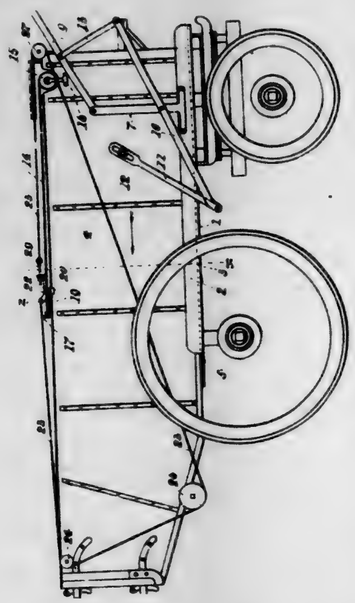
16. The method of reversing an electric motor, consisting in developing in a circuit two points of potential independently of the source of electromotive force, connecting between said two points of potential the element of the motor to be reversed, and varying the potential at one or both of said points so that the potential at one point will be higher than at the other point, thereby producing a flow of current in either direction from the point of higher to the point of lower potential.

709,715. **DUMPING-WAGON.** WILLIAM LEONHARDT, Baltimore, Md. Filed Oct. 4, 1901. Serial No. 77,525. (No model.)

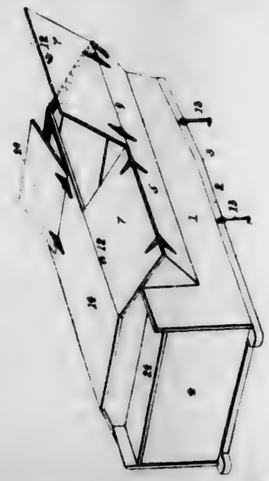
Claim.—1. In a wagon, the body thereof provided with a roller having a flexible cover which is wound thereon, the free end of the said cover being shod and provided with a strip with its ends turned down to form lips which engage with the edge of the body and serve to prevent lateral displacement of the cover, substantially as specified.

2. In a dumping-wagon, the sills thereof at one side of the wagon provided with a standard, and combined with a hand-lever pivoted to the upper end of the said standard, a cross-lever pivoted to near the bottom of the said standard, a pitman to connect one end of the said cross-lever to a stud on the side of the body, and another pitman which unites the other end of the said cross-lever to the said hand-lever, substantially as specified.

709,715.



709,716. DUMPING CART OR WAGON. WILLIAM LEONHARDT, Baltimore, Md. Filed July 14, 1902. Serial No. 115,795. (No model.)



Claim.—In a dumping-wagon, the body proper thereof of rectangular shape in cross-section, and provided at its sides with flaring extensions the edges of which are lower than those of the rectangular portion, and downwardly-inclined lids or covers for the said extensions, substantially as, and for the purpose specified.

709,717. NUT-LOCK. THOMAS LYTHE, Puritan, Pa. Filed Mar. 14, 1902. Serial No. 98,198. (No model.)

Claim.—1. The combination, with a bolt provided with longitudinal grooves, of a nut having a chamber and a slot in its upper part, a spring locking-pawl provided with a shank which engages with the said slot and a flange which projects laterally from the top of the shank, and means for securing the said flange to the nut, substantially as set forth.

2. The combination, with a grooved bolt, of a nut provided with a slot in its upper part, a spring locking-pawl provided with a flanged and tapering shank which is wedged tightly into the said slot, and a fastening device which secures the flange of the said shank to the nut, substantially as set forth.

709,718. BICYCLE-FRAME. ROBERT F. MOSAHAN, Buffalo, N. Y. Filed Sept. 20, 1901. Serial No. 75,676. (No model.)

Claim.—1. A bicycle wheel-frame, having resilient frame-bars extended between the saddle-post and the rear axle, and a brace extending between the resilient frame-bars and the saddle-post.

2. A bicycle wheel-frame, having two resilient frame-bars extended between the saddle-post and the rear axle, a brace extending between the resilient frame-bars and saddle-post, and means for adjusting the length of said brace for the control of the resilience of said frame-bars.

3. A bicycle wheel-frame having an air-cushion device on the rear frame-fork, and connected with the upper part of the saddle-post, two resilient frame-bars extending between the saddle-post and the rear axle, a brace extending between the resilient frame-bars and the saddle-post, and means for adjusting the brace.

4. A bicycle wheel-frame, comprising two independent spring members loosely mounted at one end on the rear axle of the bicycle, bracket-arms having hubs loosely mounted on projections from the lower end of the saddle-post, and arms integral with the said hubs, and with which the opposite ends of the said spring members are adjustably connected.

5. A bicycle wheel-frame, embodying two spring members pivotally connected at their rear ends with the ends of the rear axle, a bracket-arm on the front end of each spring member, having a hollow hub mounted on projections from the lower end of the saddle-post, and a brace extended from an arm on the saddle-post and adapted for connection with the two bracket-arms on the spring members.

6. A bicycle wheel-frame having two spring members pivotally connected at their rear ends with the ends of the rear axle, a bracket-arm on the front end of each spring member and each having a hub mounted on the ends of the crank-shaft box, and an upright brace adjustably connected at its upper end with an arm on the saddle-post, the lower end of said brace having lateral limbs held in engagement with boxes mounted on the said bracket-arms.

7. A bicycle wheel-frame having two spring members loosely mounted at one end on the rear axle of the bicycle, and brackets each comprising a hub mounted on the respective end of the crank-axle box of the frame, and an integral arm slitted horizontally and adapted to receive the other end of the corresponding spring member.

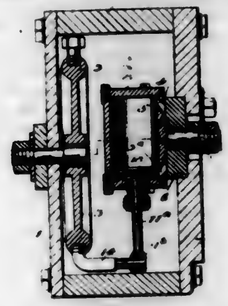
8. A bicycle wheel-frame, embodying a two-part rear frame-fork, the hollow upper member thereof sliding air-tight upon the cylindrical stem of the lower part, two spring-bars extended from the rear axle carried by the rear frame-fork, and brackets having hubs mounted on projections on the lower ends of the saddle-post of the frame and arms integral with the respective hubs and slitted horizontally to receive the forward ends of said spring-bars.

9. A bicycle wheel-frame, embodying a two-part rear frame-fork, the hollow upper member thereof sliding air-tight upon the cylindrical stem of the lower part, two spring-bars extended from the rear axle carried by the rear frame-fork, bracket-arms connecting the forward ends of the spring-bars with the crank-axle box of the frame, and a brace adjustably connected with an arm on the saddle-post of the frame, and adapted for a slightly-yielding connection with the bracket-arms.

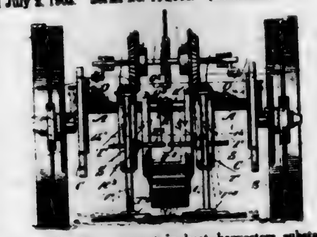
709,719. STEAM-ENGINE. ARSINOLE P. MORRIS and HENRY J. BERGERON, Jeanerette, La. Filed Apr. 30, 1902. Serial No. 105,365. (No model.)

Claim.—1. A steam-engine embracing a revolving piston-cylinder, a crank, whose axis is eccentric with the axis of said cylinder, a bent-arm connection between said crank and the piston-rod of said cylinder, said arm connection having its bent or right-angled terminal connected radially to said crank, and means for supplying pressure to said cylinder, substantially as set forth.

2. A steam-engine embracing a revolving piston-cylinder, a crank-wheel whose axis is eccentric with the axis of said cylinder, a bent-arm connection between the piston-rod of said cylinder and said crank-wheel, said bent-arm connection having its bent or right-angled terminal connected to the periphery of said crank-wheel, substantially as set forth.



709,720 BEET-TOPPER. MERRITT W. PALMER, Hamilton, Mich. Filed July 2, 1902. Serial No. 114,051. (No model.)



Claim.—1. The improvement in beet-harvesters substantially as herein described comprising the main frame having the end bars and the guide-frames secured to the inner sides of the end bars and having upright guide-slots for the carrier-frame, the axle-frames fitted against the outer sides of the end bars, the bolts securing the axle-frames and the guide-frames to said end bars, the stud-axles projecting from the axle-frames and having the non-circular portions adjacent to the axle-frames, the rearwardly-inclined arms fitting at their lower ends on the non-circular portions of the stud-axles and provided near their upper ends with bearings for the counter-shaft, the counter-shaft, the carrier-frame guided at its ends in the slots of the guide-frames and provided with the cutters, the shafts therefor and the main shaft geared with the cutter-shafts, and gearing between the main shaft and the counter-shaft, swinging links connecting the main shaft with the counter-shaft, means for suspending the carrier-frame from the main frame and means for operating the counter-shaft substantially as set forth.

2. In a carrier-frame for beet-harvesters the combination with the front and rear bars having at their ends inwardly-projecting ears, the end plates secured to said ears, the lugged plates secured to the inner sides of the front and rear bars and having at their upper edges near their opposite ends the inwardly-projecting lugs, and the bars secured on said lugs and provided with bearings for the main shaft, substantially as set forth.

3. The combination substantially as herein described with the carrier-frame and the devices operating therein, of the main frame having end bars, the guide-frames secured to the inner sides of the end bars and having guide-slots for the carrier-frame, the axle-frames secured to the main frame and having stud-axles, the arms secured to the stud-axles and extending upwardly and rearwardly therefrom, the counter-shaft, means for driving the counter-shaft, and connections between the counter-shaft and the devices operating on the carrier-frame substantially as set forth.

4. The combination of the topper-shafts, the main shaft geared with the topper-shafts and the swinging links having bearings for the main shaft substantially as set forth.

5. The combination with the main frame and the carrier-frame sliding therein and provided with the topping devices, of the gage devices consisting of the roller, the bent-frame for said roller, hangers connecting the said frame with the sliding carrier, and connections between the bent-frame and parts connected with the main frame substantially as set forth.

6. The combination of the main frame, the carrier-frame movable vertically therein, the main lever extending across the main frame and pivoted at one end, devices suspending the carrier-frame from the main lever, and the operating-lever arranged to operate upon the main lever substantially as set forth.

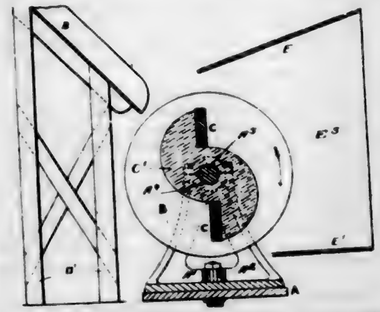
7. The combination with the main frame, of the counter-shaft, bearings for the counter-shaft supported on the main frame, the drive-wheels arranged to operate the counter-shaft, the carrier-frame movable vertically in the main frame, means for suspending and adjusting the carrier-frame in the main frame, the main shaft, the topping devices, and connections between the counter-shaft and the main shaft substantially as set forth.

8. In a beet-topper substantially as described the combination of the carrier-frame, the main frame in which said carrier-frame is slidably supported, the arc-bar supported on the main frame and extending from front to rear thereof and provided with the keeper portion at its rear end and with means for supporting the movable end of the main lever adjustably in said keeper, the main lever pivoted at one end and movable at its other end in the keeper portion of the arc-bar, the pivoted operating-lever engaging the main lever, and means connecting the main lever with the carrier-frame, substantially as set forth.

9. The combination substantially as herein described of the main frame, the carrier frame slidable vertically therein and having the front and rear bars, and the front and rear lugged plates, the front plate having between its ends the upper and lower lugs, the suspending devices for the carrier-frame connected with the upper lugs, the rocking frames supported in the carrier-frame, stop devices for the rocking frames, and the hanger R supporting the stop devices and secured at its upper end to the lower lug of the front lugged plate of the carrier-frame, the topping devices and means for operating the same substantially as set forth.

10. In a machine substantially as described, the combination of the main frame provided at its ends with the stud-axles and between its ends with the transversely-extending main lever, the arms secured to the stud-axles and extending upwardly and rearwardly therefrom, the counter-shaft journaled in the upper rear ends of the said arms, the drive-wheels geared with the counter-shaft, the sliding carrier-frame provided with the topping devices and with the main shaft geared therewith, devices suspending the carrier-frame from the main lever, the swinging links connecting the main shaft with the counter-shaft, gearing between the main shaft and the counter-shaft, and the operating-lever engaging the main lever substantially as set forth.

709,721. CENTRIFUGAL TAILINGS-ELEVATOR. WALTER PECK, Dunedin, New Zealand. Filed July 9, 1901. Serial No. 67,853. (No model.)



Claim.—In a machine of the class described, a wheel provided with beaters, said wheel being mounted for rotation, and being free of an inclosing casing, whereby, on the rapid rotation of said wheel, material supplied thereto will be centrifugally scattered, and the standard of the wheel being swivelly mounted.

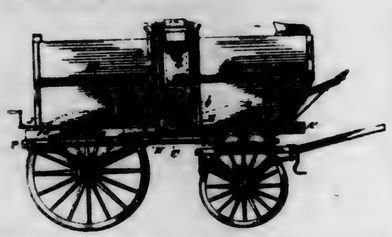
709,722. BLACKBOARD-ERASER. FRANKLIN G. RAMER, Akron, Ohio. Filed Mar. 31, 1902. Serial No. 100,788. (No model.)

Claim.—1. A blackboard-eraser comprising a body carrying an erasive surface, and a rim formed of a non-dust-absorbing material surrounding said erasive surface and projecting beyond the outer face thereof, substantially as described.

2. A blackboard-eraser comprising a body carrying an erasive sur-

face, and a rim formed of a non-dust-absorbing material surrounding said erasive surface and spaced therefrom, substantially as described.

709,728. CHUTE-WAGON. ALEXANDER RAY, Philadelphia, Pa., assignor to Edward S. Lowry, Philadelphia, Pa. Filed Aug. 1, 1902. Serial No. 117,997. (No model.)



Claim.—1. In a wagon for delivering coal, &c., the combination of two body-compartments separated by an intermediate compartment or space, gates or doors opening from the body-compartments into the intermediate compartment or space, a traveling conveyor extending into the intermediate compartment or space and directed transversely upward from the side of the wagon for receiving and elevating the coal, &c., and delivering it at one side of the wagon.

2. In a wagon for delivering coal, &c., the combination of two body-compartments separated by an intermediate compartment or space, gates or doors opening from the body-compartments into the intermediate compartment or space, a conveyer extending into the intermediate compartment or space and extending transversely and upward from the side of the wagon for receiving the coal, &c., and delivering it at one side of the wagon, and a chute detachably connected to the upper end of the conveyer for receiving the coal or other material therefrom and allowing it to travel by gravity to the place of reception.

3. In a wagon for delivering coal, &c., the combination of two body-compartments separated by an intermediate compartment or space, gates or doors opening from the body-compartments into the intermediate compartment or space, a conveyer extending into the intermediate compartment or space and extending transversely and upward from the side of the wagon for receiving the coal, &c., and delivering it at one side of the wagon the said conveyer being jointed and comprising a relatively fixed portion arranged between the body-compartments and a jointed portion adapted to be extended obliquely upward and away from the fixed portion or turned backward from the fixed portion and within the intermediate compartment during transportation.

4. In a wagon for delivering coal, &c., the combination of two body-compartments separated by an intermediate compartment or space, gates or doors opening from the body-compartments into the intermediate compartment or space, a conveyer extending into the intermediate compartment or space and extending transversely and upward from the side of the wagon for receiving the coal, &c., and delivering it at one side of the wagon the said conveyer being jointed and comprising a relatively fixed portion arranged between the body-compartments and a jointed portion adapted to be extended obliquely upward and away from the fixed portion or turned backward from the fixed portion and within the intermediate compartment during transportation, and means carried by the wagon for driving the conveyer.

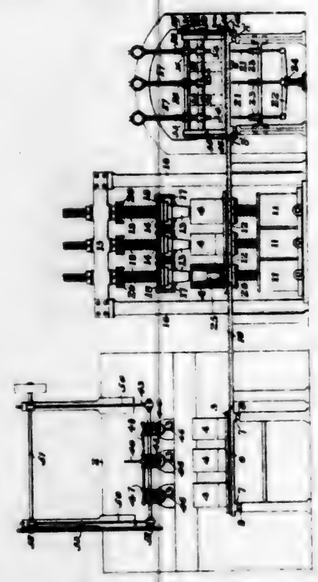
5. In a wagon for delivering coal and other material in loose form, the combination of a compartment having a discharge-opening at one end, a fixed trough arranged transversely across the end of the compartment and close to the discharge-opening therefor, a movable trough hinged to the fixed trough at one end adjacent to the side of the wagon-body, means for holding the movable trough at an oblique angle, an endless conveyer adapted to said troughs, hand-operated means on the wagon to propel the conveyer, and an adjustable gravity-actuated chute leading from the upper end of the inclined trough.

6. In a wagon for delivering coal and other material in loose form, the combination of a compartment having a discharge-opening at one end, a fixed trough arranged transversely across the end of the compartment and close to the discharge-opening therefor, a movable trough hinged to the fixed trough at one end adjacent to the side of the wagon-body, means for holding the movable trough at an oblique angle, an endless conveyer consisting of two endless chains and transverse blades adapted to said troughs, guide-wheels at the distant ends respectively of the fixed and movable troughs for the conveyer, guides *c c* for holding the conveyer-chains down to the fixed trough adjacent to the hinged part of the movable trough, hand-operated means on the wagon to propel the conveyer, and an adjustable gravity-actuated chute leading from the upper end of the inclined trough.

7. In a wagon, the body part consisting of two body-compartments having oppositely-inclined bottoms, an intermediate chamber or space between the body-compartments, discharge-gates from the body-compartments into the intermediate compartment, and a movable endless conveyer extending transversely upward from the intermediate chamber for elevating the material and discharging it to one side of the wagon.

8. In a wagon, the body part consisting of two body-compartments having oppositely-inclined bottoms, an intermediate chamber or space between the body-compartments, and discharge-gates from the body-compartments into the intermediate compartment, the side walls on one side of the wagon being continuous over the intermediate compartment and on the other side divided and omitted at the intermediate compartment, in combination with an elevating-conveyer hinged to the lower part of the intermediate compartment and movable into or from the intermediate compartment through the open side thereof.

709,724. GLASS-SHAPING APPARATUS. DANIEL C. RIPLEY, Pittsburg, Pa. Filed May 10, 1902. Serial No. 106,734. (No model.)



Claim.—1. A furnace, a gathering-station adjacent thereto, a track extending from the gathering-station to a pressing-station, and means for returning the molds to the gathering-station; substantially as described.

2. In glass-shaping apparatus, a gathering-station, a pressing-station having pressing apparatus, press-molds, a track extending between the gathering-station and pressing-station, and another track for returning the molds to the gathering-station; substantially as described.

3. In glass-shaping apparatus a group of molds, a support therefor, a gathering-station having gathering apparatus, a pressing-station having pressing apparatus, and mechanism for transferring the support from the gathering to the pressing station, and vice versa; substantially as described.

4. In glass-shaping apparatus, a support having a group of molds thereon, a gathering-station having gathering apparatus, a pressing-station, and an ejecting-station, mechanism for transferring the molds from the gathering-station successively to the pressing and the ejecting station, and mechanism for returning the molds to the gathering-station; substantially as described.

5. In glass-shaping apparatus, a gathering-station, a plurality of tracks extending therefrom to a pressing-station, and a movable track-section at the gathering-station arranged to be brought into alinement with either track; substantially as described.

6. In glass-shaping apparatus, a pair of tracks, a movable track-section at each end of the tracks, glass-molds supported upon the tracks, and a pressing-station along one of the tracks; substantially as described.

7. In glass-shaping apparatus, a gathering-station having gathering apparatus, a pressing-station, an ejecting-station, mechanism for transferring the molds between said stations, and ejector mechanism arranged to lift the articles from the molds; substantially as described.

8. In glass-shaping apparatus, a furnace having a gathering-hole, a mold beneath the gathering-hole and between it and the operator's station, a glass-shaping station having shaping apparatus, and mechanism for transferring the filled mold from the gathering-station to said shaping-station; substantially as described.

9. The combination with a glass-furnace having a gathering-hole, of gathering apparatus, a mold beneath the gathering-hole and between it and the operator's station, a glass-shaping station having shaping apparatus, and mechanism for transferring the filled mold from the gathering-station to the shaping-station; substantially as described.

10. A glass-mold, an ejector arranged to lift the article therefrom, a clamp, and mechanism for causing the clamp to engage the article and for moving the clamp; substantially as described.

11. In glass-shaping apparatus, a lear, a glass-mold, an ejector for the mold, a clamp arranged to seize the article lifted by the ejector, and mechanism for moving the clamp to deposit the article in the lear; substantially as described.

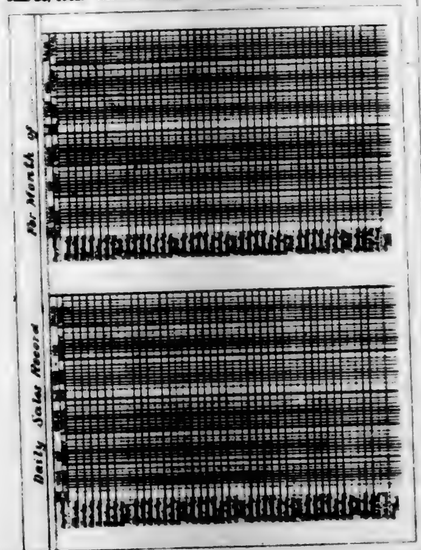
12. In glass-shaping apparatus, a mold, an ejector therefor, a lear having an entrance-opening, a swinging clamp arranged to seize the article lifted by the ejector, and mechanism for swinging the clamp and opening it to deposit the article at the lear-entrance; substantially as described.

13. In glass-shaping apparatus, a glass-mold, a lear, mechanism for transferring the article from the mold to the lear-opening, a pusher arranged to move the articles longitudinally into the lear, and connections for actuating the pusher; substantially as described.

14. A glass-mold, an ejector therefor, a movable clamp, mechanism for moving the clamp, an opening device, and mechanism for disengaging the opening device to allow the clamp to seize the article; substantially as described.

15. A glass-mold, a lifter for the article, a separate swinging clamp device, a lear, mechanism for swinging the clamp to bring the article to the lear-opening, and mechanism for disengaging the clamp; substantially as described.

709,725. BOOKKEEPING. CLARK SELTZ, Seattle, Wash. Filed Jan. 20, 1902. Serial No. 90,483. (No model.)

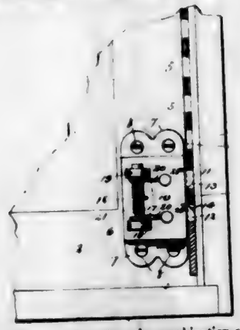


Claim.—1. A quadrennial book, having a set of leaves suitably ruled and appropriately designated for the reception of data relating to notes or bills; another set of leaves designated to receive respectively and in succession, data for successive periods of time, each leaf having appropriately-designated spaces for the reception of amounts of daily sales, one for each day of the period to which the page is devoted, the spaces of each page being arranged in several columns respectively designated to receive the said amounts, for the same period of a different year; another set similarly ruled and designated for the reception of daily cash receipts and disbursements; and another set of leaves having appropriately-designated spaces for the monthly business of each of the four years, each half-page having the names of the months of each year on the left side, and columns respectively designated for the amounts of the "cash sales," "credit sales," "purchases," "receipts," "disbursements," "ledger folio," and "expenses," of each month of one year, with the totals for each of the several items, substantially as described.

2. In a "quadrennial book-summary," a "daily sales-record," double-paged, each single page being so ruled as to make it a double page and designated as follows: over the first and second columns of the first and third subpages, with the words: "Day of week;" and "Day of month," under the words "Day of week," the words "Monday" and the successive days of the week, the second and fourth subpages being like the first and third, except the words "Day of week" are not set forth at the heading thereof, in a separate column, each of the subpages having the following words and figures, at the head of separate columns: "Year" under which is the word "Cash;" "190-" under which is the word "Credit;" "Sales" under which is the word "Total;" after the word "Sunday" of each week, the word "Week:" at the lower end of the first column, on the first and third subpages, on separate lines, the words "Total for mo.;" "Amount forw'd;" "Grand total," whereby a "daily sales-record" may be kept, substantially as and for the purposes set forth.

3. In a "quadrennial book-summary," a "daily cash-record," double-paged, each single page being so ruled as to make it a double page and designated as follows: over the first and second columns, of the first and third subpages, with the words: "Day of week;" and "Day of month;" under the words "Day of week," the words "Monday" and the names of the successive days of the week, the second and fourth subpages being like the first and third, except the words: "Day of week," are not at the head of a separate column, with the days of the week following; the words: "Receipts;" "Disbursements;" "On hand;" being at the head of separate columns, on each subpage, and above these words, the word and figures "Year 190-;" at the lower end of the first column, on the first and third subpages, on separate lines, the words: "Total for mo.;" "Amount forw'd;" "Grand total," whereby, a "daily cash-record," may be kept as and for the purposes set forth.

709,726. WINDOW-FASTENING DEVICE. DANIEL SHELL, Harmony, Ind. Filed May 14, 1902. Serial No. 107,221. (No model.)

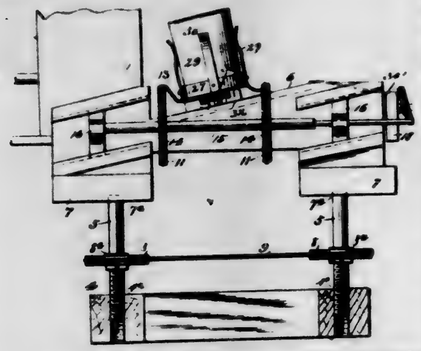


Claim.—In a window-fastening, the combination of a rack having rectangular apertures thereon rounded off on their upper and lower edges, a casing mounted on a sliding sash, a bolt slidingly mounted in said casing and having a beveled head constructed to positively engage the said rack to hold the window against being raised, a bolt slidingly mounted in said casing and having a beveled head constructed to positively engage said rack to hold said window against being lowered, said bolts having slots in their ends, pins mounted transversely said slots, a rod mounted on said casing, elbow-levers fulcrumed on said rod and bearing thumb-pieces, said levers having forked arms which engage said pins, and a spiral spring mounted on said rod and arranged to actuate said levers, substantially as described.

709,727. GLASS-MELTING MACHINE. JOHN C. TRIAMM, Rochester, Pa., assignor of two-thirds to Mathew J. Fantini and John A. Deckter, Tarentum, Pa. Filed Feb. 20, 1902. Serial No. 94,944. (No model.)

Claim.—1. In a tumbler-finishing machine, the combination with an inclined table, means for adjusting the height of said table, a carrier-

belt bearing tumbler-holders, and means for driving said carrier-belt, substantially as described.



2. In a machine for finishing tumblers, the combination, of two pairs of slidingly-mounted brackets, the members of each pair being connected to move in unison, shafts journaled in said brackets, guides bearing a rack-bar and mounted to be moved transversely, a carrier-belt mounted on said sheaves and bearing rotatable holders constructed to be actuated by said rack-bar, and means for moving said brackets and said guides in unison to adjust the machine for different sizes of tumblers, substantially as described.

3. In a tumbler-finisher, the combination with a table, of transversely-adjustable brackets mounted on said table, shafts journaled in said brackets and bearing pulleys, and a conveyer bearing tumbler-holders mounted on said pulleys, substantially as described.

709,728. TOY. JESS M. K. WALDSTEIN, Chicago, Ill. Filed May 24, 1902. Serial No. 108,782. (No model.)

Claim.—1. A toy for distributing confetti, or like substances, composed of a receptacle for the substances, and a hollow plunger adapted to fit the discharge end of such receptacle and to permit air to be forcibly discharged therethrough, thereby discharging at the same time the confetti from the receptacle; substantially as and for the purpose set forth.

2. A toy comprising a conical receptacle open at its discharge end, and a hollow plunger adapted to comfortably fit said discharge end of the receptacle and to permit air to be forcibly blown therethrough; substantially as and for the purpose set forth.

3. A toy for the discharge of confetti, or like substance, consisting of a conical receptacle, open at its discharge end, and a hollow plunger having a flaring end adapted to fit the discharge end of the receptacle and also open at its other end; substantially as and for the purpose set forth.

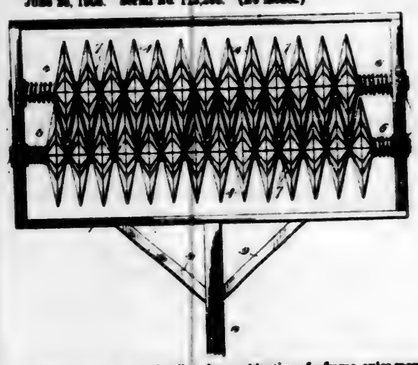
4. A toy comprising a conical receptacle open at its discharge end, and a hollow plunger having a flaring open end adapted to the discharge end of the receptacle, and provided with notches in such flaring end; substantially as and for the purpose set forth.

5. A toy comprising a receptacle for confetti, or similar material, open at its discharge end, and having a hollow plunger fitted to the interior of such receptacle, said plunger provided also with an open discharge end and an open outer end fitted with a musical device capable of being operated by the air forced through the plunger to discharge the confetti from the receptacle; substantially as and for the purpose set forth.

6. A toy comprising a receptacle for confetti, or similar substance, and a hollow plunger adapted to such receptacle and constructed to act as a blowpipe and also as a horn; substantially as and for the purpose set forth.

7. A toy comprising a conical receptacle and a hollow plunger flared and notched at its discharge end and provided with a wind instrument at its other end; substantially as and for the purpose set forth.

709,729. LAND-ROLLER. ADOLPH YOOST, Kankakee, Ill. Filed June 26, 1902. Serial No. 113,269. (No model.)



Claim.—1. In a land-roller, the combination of a frame, axles mounted in bearings on said frame, rollers independently mounted to rotate on said axles, the rollers on one axle being adapted to intermesh with the rollers on the other axle, and means whereby the said rollers on each axle are held in yielding contact with the adjacent rollers on said axle, substantially as described.

2. In a land-roller, the combination with a frame, of axles mounted in bearings on said frame, rollers independently mounted to rotate on said axles, the rollers on one axle being adapted to intermesh with the rollers on the other axle, springs coiled around each end of said axles, between the end rollers and the bearings of the axles, to hold said rollers in yielding contact, substantially as and for the purpose described.

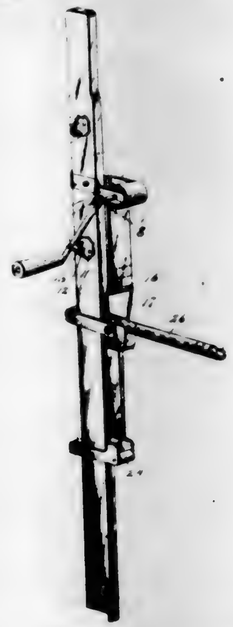
709,730. VEHICLE-JACK. AUGUST SWICKER, Rusk, Tex. Filed Jan. 31, 1902. Serial No. 92,068. (No model.)

Claim.—1. A jack of the class set forth, comprising an upright, a slide mounted on the upright and having a support pivotally connected thereto, a winding mechanism above the slide, and a flexible connection between the winding mechanism and slide.

2. A jack of the class set forth comprising an upright, a slide mounted on the upright and having a support pivotally attached thereto, a winding mechanism having a pivoted winding device, upper and lower stops to engage the winding device, and a flexible connection between the winding mechanism and the slide.

3. A jack of the class set forth comprising an upright, a slide mounted thereon and provided with a pivoted support, a winding mechanism having a winding device pivotally attached thereto, upper and lower stops with inclined edges and concave seats for engagement by said winding device, and a flexible connection between the winding mechanism and the slide.

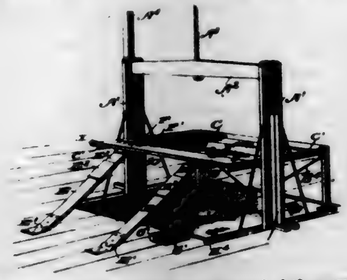
4. In a jack of the class set forth, the combination of an upright, a slide mounted thereon and having antifrictional rollers engaging opposite edges thereof, a support pivotally carried by the said slide, winding mechanism above the slide, and a flexible connection between the slide and winding mechanism.



709,731. FILLING OR REFILLING FOUNTAIN-PENS. ROBERT H. ASHCROFT, Dunedin, New Zealand. Filed June 6, 1901. Serial No. 63,420. (No model.)

Claim.—In a fountain-pen, a barrel having a pair of circumferential and circular shoulders, and diametrically opposite slots between said shoulders, the opposite ends of the slots terminating short of the respective shoulders to thereby leave the barrel solid between the ends of said slots and said shoulders, and an elastic sleeve embracing the barrel between said shoulders and the ends of the sleeve abutting against said shoulders.

709,732. ELEVATOR. CHARLES L. BALDWIN and OLLIE A. GREEN, New York, N. Y.; said Baldwin assignor to Maud E. Baldwin, New York, N. Y. Filed Dec. 28, 1901. Serial No. 87,642. (No model.)



Claim.—1. An elevator having a supplemental platform arranged above the main floor or platform, said supplemental platform being hinged or pivoted at its rear end, substantially as described.

2. An elevator having a supplemental platform arranged above the main floor or platform, and the inclined skids leading to the said supplemental platform, substantially as described.

3. An elevator having a supplemental platform arranged above the main floor or platform in combination with the hinged skids adapted to rest upon the supplemental platform, and means for automatically releasing the said skids, as set forth.

4. An elevator having a supplemental platform arranged above the main floor or platform and pivoted at its rear end, in combination with means for elevating and inclining the said supplemental platform for the purpose described.

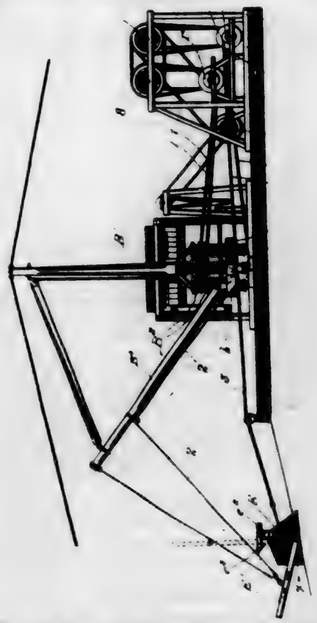
5. An elevator having a supplemental platform arranged above the main floor or platform, in combination with the hinged skids, and the spring-actuated bars or bolts carried by the supplemental platform adapted to hold the said skids elevated, and means for releasing said bars or bolts, substantially as set forth.

6. An elevator having a supplemental platform arranged above the main platform or floor, said supplemental platform being provided with forwardly-projecting spring-actuated bars or bolts, each bar or bolt having an upwardly-projecting arm working in a slot produced in the platform in combination with the hinged skids, each skid having a hinged end, for the purpose described.

7. The combination with the elevator having a supplemental platform arranged above the main floor or platform, said supplemental platform being pivoted at its rear end and provided with guide-rollers at its forward ends, of the inclined side bars upon which the guide-rollers are adapted to travel whereby the supplemental platform is elevated or inclined, for the purpose described.

8. The combination with the elevator having a supplemental platform arranged above the main platform and pivoted at its rear end and provided with guide-rollers at its forward end, of the guide-bars with which the guide-rollers are adapted to contact, said guide-bars having the adjustable extensions at their upper ends, as and for the purpose described.

709,733. MINING-DREDGE. HENRY J. BARTON and AUGUST C. LA BUD, Oakbar, Cal. Filed June 20, 1901. Serial No. 65,288. (No model.)



Claim.—1. In a mining dredge or excavator, the scoop of shovel form, the draft-loop connected to the lateral walls of said scoop just above the center of the height thereof, the rear handle-lever pivoted to said scoop, a catch carried by the scoop for holding said lever upright, the loading-drum located near the surface of the ground, the draft or loading cable carried by said drum, and connected to said draft-loop, and the hoisting-cable connected to said handle-lever, substantially as specified.

2. In a mining dredge or excavator, the dredge bucket or scoop having a lever pivoted thereto, a catch carried by the scoop for said lever, a derrick, guide-pulleys, and a hoisting-cable connected at one end portion thereof, to the outer end of the derrick-beom looped around a connection of the scoop-lever, and thence passing around said guide-palleys to the hoisting-drum, substantially as specified.

3. In a mining dredge or excavator, the scoop of shovel form, having the forward draft-loop, and the rear handle and hoisting-lever, and a catch carried by the scoop for said lever to hold the lever upright, substantially as specified.

4. In a mining dredge or excavator, the scoop of shovel form, having the handle and hoisting-lever pivoted thereto, said lever having the scoop-embracing fork and the rear power or handle extension thereof, a catch carried by the scoop for said lever to hold the lever upright, such lever being arranged to swing rearwardly of the scoop when released, substantially as specified.

5. In a mining-dredge, the straight forked carrier, the scoop of shovel form pivoted to said carrier, a catch upon the scoop for said carrier, the draft-cable connected to the scoop and the hoisting-cable connected to the carrier in rear of the fork thereof, substantially as specified.

6. In a mining-dredge, the straight forked carrier, the scoop of shovel form pivoted to said carrier, and having a catch arranged to engage the transverse arms of the carrier-fork, the draft-cable connected to the forward end portion of the scoop above the center of the height thereof and the hoisting-cable connected to said carrier, substantially as specified.

7. In a dredge-excavator, the scoop, the draft-cable connected to the forward part of said scoop, a lever pivoted to said scoop, a catch carried by the scoop for said lever, the derrick, and a cable carried by said derrick and connected to said lever and arranged to first effect the catch between lever and scoop, and to subsequently hoist the scoop, substantially as specified.

8. In a dredge-excavator, the scoop of shovel form having the rearwardly-extending catch-shoulders, the lever pivoted to said scoop and having the cross-arm, and the hoisting-cable connected to said lever and arranged to first effect an engagement of said catch-shoulders and cross-arm, and to subsequently hoist the scoop, substantially as specified.

709,784. **KNITTED FABRIC.** DAVID C. BELLIS, Elizabeth, N. J., assignor to Robert W. Scott, Philadelphia, Pa., and Louis Napoleon Devon Williams, Ashbourne, Pa. Filed Feb. 15, 1902. Serial No. 94,194. (No model.)

Claim.—1. A knitted fabric comprising two webs, one overlying the other and united at intervals by a loop of the yarn of one web engaging the other web, said points of union being separated in the direction of the wales, substantially as specified.

2. A knitted fabric comprising two webs one overlying the other and united at intervals by yarn of one web forming loops in the other web, said loops not being drawn through the stitches in the latter web, substantially as specified.

3. A knitted fabric comprising two webs one overlying the other and connected at intervals by yarn of one web forming loops in wales of the other web instead of in corresponding wales of its own web, substantially as specified.

4. A knitted fabric comprising two webs one overlying the other and connected together by yarn of one web forming loops in wales of the other web throughout an entire course of such web, substantially as specified.

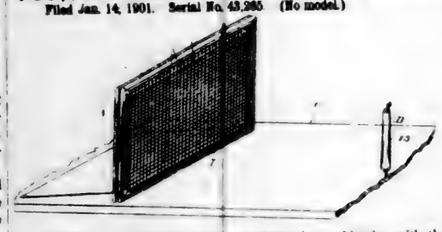
5. A knitted fabric comprising two webs of different texture one overlying the other, said webs being united by yarn of one web engaging the other web at intervals in the direction of the wales, substantially as specified.

6. A knitted fabric comprising two webs one overlying the other, one web being composed of stitches of coarser yarn than those of the other web, said webs being united at intervals in the direction of the wales by loops of the finer yarn engaging with wales of the coarser web, substantially as specified.

709,735. **FENCE-POST.** CHARLES O. BLEE and JAMES H. REDDING, Rensselaer, Ind. Filed Apr. 30, 1902. Serial No. 105,360. (No model.)

Claim.—A fence-post comprising an angular body of molded material having a hollow base, a single tie-rod embedded therein at diagonally opposite corners looped at the top and having both ends projecting from the bottom of the post, binding-nuts on said ends, and wire-attaching holes across a corner of the post within and adjacent the tie-rod.

709,786. **DRAFTING-PLOTTER.** R. L. BOTTS, St. Paul, Minn. Filed Jan. 14, 1901. Serial No. 43,265. (No model.)



Claim.—1. A drafting-plotter, consisting in combination with the sight D, composed of the standard 15, having a screw 16 for fastening upon a suitable support, and a clip 17 carried by said standard having the sight-opening 18, a screen, composed of evenly-spaced horizontal and vertical cords, a frame to which said cords are suitably fastened, having cord-indicating marks, a brace hinged to said frame adapted to support the screen erect upon a suitable support when open and to close so as to hold the picture upon the screen, and a tongue and groove for locking the brace closed.

2. A drafting-plotter, consisting of a frame composed of two sections, a plurality of intersecting cords fastened between said sections and forming a screen, a combined back and brace hinged to said frame adapted to rest flat against the intersecting cords when closed and to support the frame in upright position when open, a thumb-catch by which said combined back and brace is locked closed, a sight-standard, and a clip attached to said standard, perforated for viewing an object through the screen formed by the intersecting cords.

709,737. **CONVEYER.** MASON BRADFIELD, Los Angeles, Cal., assignor to Emma N. Bradfield, Los Angeles, Cal. Filed May 24, 1901. Serial No. 61,758. (No model.)

Claim.—1. A conveyer provided with a main bail and having a supplemental bail pivotally connected therewith, a hoisting-line and a device attached thereto and connected with the latter bail constructed to support the conveyer in carrying position when in engagement with the former bail and when disengaged therefrom to rotate about the point of connection thereof with said line out of reëngagement therewith to effect the discharge of the conveyer upon the tightening of said line.

2. A conveyer provided with a main and a supplemental bail, a hook connected with the latter constructed to detachably engage the former when forced away from the conveyer and to rotate about the point of suspension thereof out of accidental reëngagement with the main bail when such force is released.

3. A conveyer provided with a main and supplemental bail, a supporting-line and a hook attached thereto and detachably connected with said supplemental bail constructed to retain engagement with said main bail while said line is taut and to rotate about the point of connection thereof with said line out of such engagement when said line is relaxed to prevent accidental reëngagement.

4. A conveyer provided with a main and a supplemental bail, a supporting-line and a hook attached thereto and having swivel connection with said supplemental bail constructed to engage said main bail when said line is taut and to rotate upon said swivel and the point of connection thereof with said line out of engagement when said line is relaxed.

5. A conveyer having a main bail rigidly secured thereto and having a supplemental bail movably connected therewith near the bottom thereof, a supporting-line, a snap connected with said supplemental bail and a hook swiveled to said snap at one side and connected at the straight end with said line, whereby the hook retains engagement with said main bail while the line is taut and rotates on said swivel and the point of connection thereof with said line out of reëngagement therewith when said line is relaxed.

6. An engaging hook having a loop or eye at one end thereof to receive a hoisting-line and provided with an apertured lug or ear near the opposite end to be connected with the article employed, said hook being constructed to rotate about the point of connection thereof with said line when the line is relaxed.

709,738. **COMPASSES.** CLAUS BRANDELL, Chicago, Ill. Filed Apr. 8, 1902. Serial No. 101,974. (No model.)

Claim.—1. A compass comprising a head having spaced transverse pivots, legs pivoted on the said pivots and mounted to swing in unison, a point pivoted on one leg, a bar pivotally connecting the said point with the said head, a marking device pivoted on the other leg, and a second bar pivotally connecting the marking device with the said head, as set forth.

2. A compass comprising a head carrying spaced pivots, legs pivoted on the pivots and having gear-segments in mesh with each other, a point pivoted on one leg, a bar connecting the said point with one of the pivots, a marking device pivoted on the other leg, and a second bar connecting the said marking device with the other pivot, as set forth.

3. A compass, comprising a head carrying spaced pivots, legs pivoted thereon and having their heels in mesh with each other, a point pivoted on one of the legs, a marking device pivoted on the other leg, and bars, of which one is pivotally connected with the needle-point and with the pivot for the other leg, and the other bar is pivoted on the pivot for the leg carrying the needle-point and is pivotally connected with the marking device, as set forth.

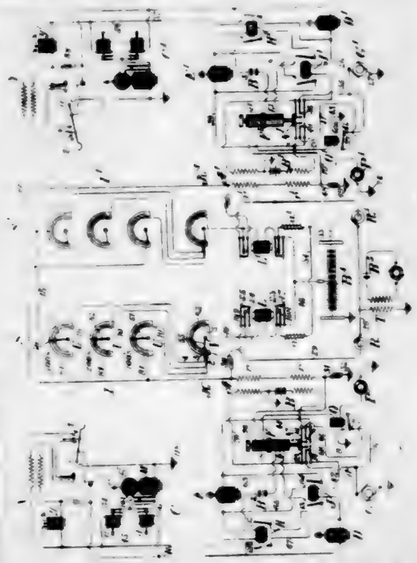
4. A compass, comprising a head carrying spaced pivots, legs pivoted thereon and having their heels in mesh with each other, a point pivoted on one of the legs, a marking device pivoted on the other leg, and bars, of which one is pivotally connected with the needle-point and with the pivot for the other leg, and the other bar is pivoted on the pivot for the leg carrying the needle-point and is pivotally connected with the marking device, the pivotal ends of the said bars having segmental slots for engaging the pivots, as set forth.

5. A compass, comprising a head carrying spaced pivots, legs pivoted thereon and having their heels in mesh with each other, a point pivoted on one of the legs, a marking device pivoted on the other leg, bars, of which one is pivotally connected with the needle-point and with the pivot for the other leg, and the other bar is pivoted on the pivot for the leg carrying the needle-point and is pivotally connected with the marking device, and a horizontal lengthening bar for the marking device, as set forth.

6. A compass, comprising a head carrying spaced pivots, legs pivoted thereon and having their heels in mesh with each other, a point pivoted on one of the legs, a marking device pivoted on the other leg, bars, of which one is pivotally connected with the needle-point and with the pivot for the other leg, and the other bar is pivoted on the pivot for the leg carrying the needle-point and is pivotally connected with the marking device, and a horizontal lengthening bar for the marking device, the lengthening bar having an extension-bar, as set forth.

709,739. **AUTOMATIC TELEPHONE-EXCHANGE.** ALBERT M. BULLARD, Somerville, Mass., assignor to the American Bell Telephone Company, a Corporation of Massachusetts. Filed Nov. 16, 1900. Serial No. 36,770. (No model.)

Claim.—1. In an automatic telephone-exchange, a selecting device, a polarized electromagnet for operating the same, and an alternating-current generator all at the central station, and a normally open circuit between said central station and a substation, in combination with an indicating mechanism, a polarized electromagnet, and a circuit-controller, all at the said substation, the said indicating mechanism being adapted to be operated in one direction by hand and in the opposite direction by said electromagnet, and the said circuit-controller being adapted to be actuated by said indicating mechanism to close the said circuit through both said electromagnets and said generator while said indicating mechanism is in operation, and to open the same when said mechanism is at rest, substantially as described.



2. In an automatic telephone-exchange, a selecting device in two parts, a separate polarized electromagnet for each of said parts to operate it independently of the other part, and an alternating-current generator, all at the central station, and two normally open circuits between said central station and a substation each including one of said polarized electromagnets, in combination with a polarized electromagnet, an indicating mechanism provided with a zero-point and adapted to be operated away from said zero-point by hand and restored thereto by said electromagnet, two electromagnetic clutch-switches associated with the said two circuits respectively, and a circuit-controller, all at the said substation, the said electromagnetic switches being adapted to connect each the conductor of its respective circuit to said circuit-controller, and the said circuit-controller being adapted to be actuated by said indicating mechanism to close either circuit in which such connection has been made through its own central-station electromagnet, the said generator, and the substation electromagnet, while said indicating mechanism is in operation, and to open the same when said mechanism is at rest, substantially as described.

3. In a selecting and connecting mechanism at the central station of an automatic telephone-exchange, two shafts each provided with a selector-arm, and each provided with a separate electromagnet whereby it may be rotated separately, and the two provided with a third electromagnet whereby they may be moved together longitudinally, substantially as described.

4. In an automatic telephone-exchange, the combination of a dial-pointer at a substation, and a selector-arm at the central station, motor mechanism for each adapted to impart rotary motion thereto, a polarized electromagnet for each adapted to actuate said mechanism, an alternating-current generator at said central station, an electric circuit between said central station and substation containing said generator and said polarized electromagnets, and a circuit-controller for said circuit associated with the motor mechanism of said pointer and adapted to be operated thereby to break the said circuit after said pointer has moved a predetermined distance, whereby the said pointer and selector-arm move synchronously and stop simultaneously, substantially as described.

5. In an automatic telephone-exchange, multiple-contact central-sta-

tion apparatus for each subscriber's line, consisting of a separate row of fixed contacts for each group of one hundred subscribers, *i. e.* a row for the subscriber's lines numbered from 100 to 199, a second row for the subscriber's lines numbered from 200 to 299, &c., each said contact being electrically united to a separate subscriber's line, and to all of the multiple fixed contacts thereof, a stationary common contact for each row of said multiple contacts adapted to be bridged to any one of the multiple contacts in its respective row by a movable conducting member, a further row of contacts similar to the said row or rows of multiple contacts, there being one contact in such further row for each one hundred subscribers in permanent electrical connection with the said stationary common contact appropriated to the row of multiple contacts belonging to the same one hundred subscribers, and a further stationary common contact likewise adapted to be bridged by a movable member with any of the multiple contacts in said further row, substantially as described.

6. In an automatic telephone-exchange separate rows of multiple contacts each representing a different group of lines, *i. e.* those from one group of subscribers in one row, those from another group of subscribers in a second row, &c., a common contact for each said row of multiple contacts in juxtaposition thereto, a further row of contacts in permanent connection each respectively with a separate one of said common contacts, and a common contact in juxtaposition to said further row, in combination with a shaft adapted to both rotate and move longitudinally, the said shaft being provided with selector-arms projecting therefrom, one for each row of multiple contacts adapted to pass along each row of multiple contacts during the rotary motion of the said shaft, and to make electrical connection between a multiple contact in each row and the common contact in juxtaposition thereto upon the longitudinal movement of said shaft, and a second shaft, also adapted to both rotate and move longitudinally, and provided with a single selector-arm adapted to pass over the said further row of contacts during the rotary motion of said second shaft, and to make electrical connection between any contact in said further row and the common contact in juxtaposition to said further row upon the longitudinal motion of said second shaft, substantially as described.

7. In an automatic telephone-exchange apparatus at the central station for each subscriber consisting of separate rows of multiple contacts for the several groups of one hundred lines each centering at said station, *i. e.*, the multiple contacts for lines numbered from 100 to 199 in one row, those for lines numbered from 200 to 299 in a second row, &c., a common contact for each row of said multiple contacts in juxtaposition thereto but normally insulated therefrom, a further row of contacts similar to said rows of multiple contacts, there being one contact in said such further row for each of said groups of subscribers in permanent electrical connection with the common contact appropriated to the row of multiple contacts belonging to the same group, and a further common contact in juxtaposition to said further row, in combination with selecting and connecting electromechanism in two parts, whereby an electrical connection can be established between any separate multiple contact in any of said rows of multiple contacts appropriated to a group of subscribers and the said common contact in juxtaposition to said row, and also an electrical connection be established between the contact in said further row appropriated to the same group of subscribers and the common contact in juxtaposition to said further row, substantially as described.

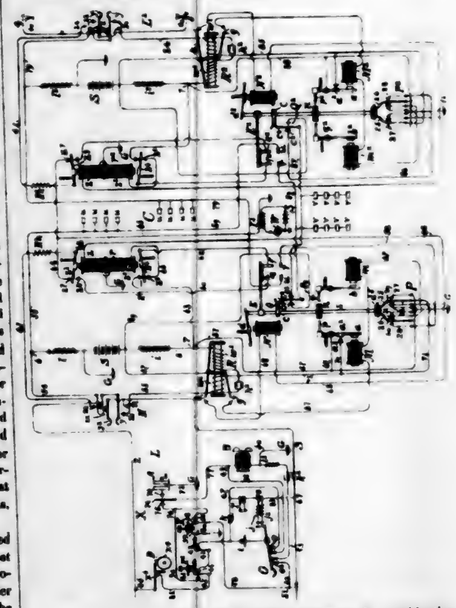
8. In an automatic telephone-exchange, two shafts each provided with a selector-arm, and each provided with a separate polarized electromagnet whereby it may be rotated separately from the other, and the two provided with a third electromagnet whereby they may be moved together longitudinally, an alternating-current generator, two relays and a battery, all at the central station in combination with two line-wires leading from the central station to a substation, a circuit-breaker at said substation provided with a polarized electromagnet for operating it adapted to be connected up separately in circuit with said generator and either of the said two central-station polarized electromagnets employed for imparting rotary motion to said shafts, and a telephone switch-hook at said substation adapted to act automatically when the telephone is removed from the hook to establish momentarily a current from said generator through both said line-wires and said relays, whereby in turn a local circuit is established from said battery through said third electromagnet at the central station employed to impart longitudinal motion to said shafts, substantially as described.

9. In an automatic telephone-exchange, two shafts each provided with a selector-arm, and each provided with a separate electromagnet whereby it may be rotated separately from the other, and the two provided with a third electromagnet whereby they may be moved together longitudinally, two relays and a source of electromotive force, all at the central station in combination with two line-wires leading from the central station to a substation, a circuit-breaker at said substation provided with an electromagnet for operating it adapted to be connected up separately in circuit with said source of electromotive force and either of the said two central-station electromagnets employed for imparting rotary motion to said shafts, and a telephone switch-hook at said substation adapted to act automatically when the telephone is removed from the hook to establish momentarily a current from said source of electromotive force through both said line-wires and said relays, whereby in turn a local circuit is established from said source of electromotive force through said third electromagnet at the central station employed to impart longitudinal motion to said shafts, substantially as described.

10. The combination with a semicircular row of multiple contacts, a shaft provided with a selector-arm and also with a polarized electromagnet for imparting a rotary movement to said shaft and thereby causing said selector-arm to swing over said semicircular row of contacts, electromechanical means for imparting a longitudinal motion to said shaft and an alternating-current generator all at the central station, of a circuit-breaker at the substation provided with a polarized electromagnet for operating it adapted to be connected up in circuit with said generator and said polarized electromagnet employed for imparting rotary motion to said shaft, the said selector-arm being provided with a self-centering contact for making connection with a desired contact in said row of multiple contacts upon the longitudinal movement of said shaft, whereby compensation is made for slight deviations in synchronism between the action of the selector-arm at the central station and the circuit-breaker at the substation, substantially as described.

11. In a selecting and connecting mechanism at the central station of an automatic telephone-exchange the combination with two rows of multiple contacts, two shafts each provided with a separate electromagnet whereby it may be separately revolved, and selector-arms carried by the said shafts respectively and adapted to pass over the said two rows of contacts respectively, of motor mechanism interposed between the said shafts and their respective actuating electromagnets, a mechanical clutch for each shaft adapted to transmit power thereto from said mechanism to rotate the said shafts independently of each other, and a third electromagnet adapted to act upon both shafts and to move them together longitudinally, substantially as described.

709,740. AUTOMATIC TELEPHONE-EXCHANGE SYSTEM AND APPARATUS. ALBERT M. BULLARD, Somerville, and MALCOLM C. ROBY, Dedham, Mass., assignors to the American Bell Telephone Company, Boston, Mass., a Corporation of Massachusetts. Filed Aug. 29, 1901. Serial No. 73,742. (No model.)



Claim.—1. In an automatic telephone-exchange, the combination of a group of metallic substation-circuits each provided with a pair of movable terminals one for each main conductor and with multiple pairs of fixed contact-terminals associated with and within range of the movable terminals of the other circuits respectively, a selecting and connecting device for each circuit adapted to move the said movable terminals thereof over the pairs of fixed terminals of the other circuits successively to select any desired or particular pair and connect the said movable terminals therewith, a selecting-electromagnet responsive to periodic interruptions of the main-line current and controlling the selecting mechanism of said device, a connecting-electromagnet responsive to a sustained main-line current to actuate the connecting mechanism thereof, and a source of current common to all said circuits, all at the central station, and a periodic interrupting device at each substation adapted to produce the requisite number of current interruptions for the operation of said selecting-electromagnet and then to close the circuit continuously for the establishment of the said sustained current required for the operation of said connecting-magnet, substantially as set forth.

2. A central-station switching apparatus for each subscriber's circuit of an automatic exchange, comprising an arc-shaped switch-plate supporting at its edge a number of pairs of insulated contact points or strips constituting multiple fixed terminals for a corresponding number of other metallic subscribers' circuits, a central shaft therefor capable of circular and longitudinal motion, a motor mechanism for the circular motion of said shaft consisting of a ratchet-wheel mounted thereon, an actuating-pawl therefor, a quick-acting electromagnet to operate said pawl by successive steps in response to periodic interruptions of the main circuit, a slow-reacting electromagnet controlling a retaining-pawl for the retention and release of said ratchet-wheel, a connecting-electromagnet adapted in response to a sustained current in said main circuit to impart longitudinal motion to said shaft, a selector-arm in electrical connection with one conductor of the main circuit extending radially from said shaft over the said fixed terminals, an insulated contact-plate electrically connected with the other main-circuit conductor mounted concentric with the switch-plate, and two contact-pieces connected with the two main conductors of the circuit through the selector-arm and contact-plate respectively and forming the movable terminals thereof, the said contact-pieces being mounted on said selector-arm over the fixed terminals of said switch-plate and adapted pursuant to the circular and longitudinal motion of said shaft to select and connect with any desired pair of said fixed terminals, substantially as herein described.

3. In the central-station apparatus of an automatic telephone-exchange, the combination with a controlling main-circuit relay having two armatures of diverse inertia and two exciting-coils in series one developing magnetism for the attraction of both said armatures into operative position and the other acting upon the heavier armature only and developing magnetism for the retention and retraction thereof, and two local circuits containing respectively a selecting and a connecting electromagnet the former controlled by the lighter and the latter by the heavier and more sluggish of said relay-armatures, of a normally open short circuit around the said retracting-coil and two circuit-closers therefor actuated by the said selecting and connecting electromagnets respectively, whereby a short circuit may be established around the said retracting-coil by the action of the selecting-magnet, and maintained by the action of the connecting-magnet, as set forth.

4. The combination in an automatic telephone-exchange switch apparatus, of a substation telephone-circuit having its main conductors provided with normally detached movable terminals to select and connect with the fixed terminals of other circuits and also provided with multiple fixed contact-terminals to be selected and connected with by the movable terminals of other circuits, a selecting and connecting device for bringing the said movable terminals into juxtaposition to any predetermined pair of fixed terminals and uniting them therewith, a selecting-electromagnet and a retaining-pawl magnet in a local circuit for operating and maintaining the operation of the selecting mechanism of said device, a connecting-magnet in a separate local circuit for operating the connecting mechanism thereof; a relay having its exciting-coils in the main substation-circuit together with a source of current, and provided with a quick-acting armature controlling the former and a sluggish armature controlling the latter of said local circuits, and an electromagnetic switch controlling the said detached movable terminals of said first-mentioned main circuit and acting when energized to unite them to their respective conductors, substantially as set forth.

5. The combination in an automatic telephone-exchange system, of a substation telephone-circuit having its main conductors provided with normally detached movable terminals to select and connect with the fixed terminals of other circuits and provided also with multiple fixed contact-terminals to be selected and connected with by the movable terminals of other circuits, a selecting and connecting device associated with said circuit and adapted to connect the movable terminals thereof with the fixed terminals of any other selected circuit, a controlling-relay in the said circuit, a local circuit governed thereby and including a connecting-electromagnet to actuate the connecting mechanism of said device, an electromagnetic switch having its actuating-electromagnet in the said local circuit controlling the said detached movable terminals and acting when energized to unite them to their respective main-circuit conductors, a normally closed short circuit around the said magnet of said switch, and means actuated by said connecting-electromagnet to remove said short circuit, substantially as and for the purposes set forth.

6. The combination in an automatic-exchange system of a substation circuit having normally detached movable terminals, selecting and connecting apparatus for connecting the said terminals with fixed terminals of another substation-circuit, an electromagnetic switch associated with said connecting apparatus controlling the said detached movable terminals and adapted when energized to unite them conductively to their respective main conductors, and means for preventing the operation of the said electromagnetic switch when the said other substation-circuit is already engaged, substantially as set forth.

7. In an automatic-exchange system, the combination of a substation-circuit having normally detached movable terminals, selecting and connecting apparatus for uniting the said terminals to fixed terminals of another substation-circuit, a testing or discriminating differential relay associated with said connecting apparatus controlling the said detached movable terminals and adapted to become energized by the passage of current through but one of its coils and to unite them to their respective main conductors, but on the passage of current through both coils to remain quiescent and to maintain the detachment of said terminals, and means for establishing current through one or both of the said coils, substantially as specified.

8. In the central-station switching apparatus of an automatic exchange, the combination substantially as herein described, of a substation main circuit having active and multiple passive terminal contacts, a selecting and connecting mechanism for said circuit, a battery or like source of electromotive force, a normally discontinuous circuit connection between said source and the several passive terminals of said main circuit, and a circuit-closing device operated by said selecting and connecting mechanism to establish the continuity of said connection when said main circuit becomes engaged, whereby an electric potential is imparted to said passive terminals to furnish current for the intrusion-preventing devices of other circuits.

9. In the central-station switching apparatus of an automatic exchange, the combination of a main substation-circuit having active and passive terminal contacts, a selecting mechanism acting to move said active terminals step by step into juxtaposition to the passive terminals of any other selected or wanted main circuit, a source of electromotive force, a normally open direct-circuit connection between said source and the said passive terminal contacts, and a commutator or switch actuated by said selecting mechanism on the first step taken thereby, to close said direct connection and thus to establish a potential on said passive terminals and indicate the engagement of the circuit to which they belong, substantially as and for the purposes specified.

10. The combination in an automatic telephone-exchange central-station apparatus, of two constituent substation-circuits each having one set of active and multiple sets of passive-terminal contacts formed or connected into a compound talking-circuit by engagement of the active terminals of the call-originating circuit with one set of the passive terminals of the call-receiving circuit, a selecting and connecting mechanism for each of the said circuits, and a source of electromotive force, with devices for impressing an intrusion-preventing potential on the vacant passive terminals of both circuits comprising for each a normally incomplete circuit connection between said source and the said passive terminals, and a circuit-closer therefor, the said circuit-closer being operated by the said selecting and connecting mechanism respectively of the call-originating substation-circuit, substantially as set forth.

11. In an automatic telephone-exchange, the combination with a call-originating or calling line, and a call-receiving or wanted line, both having a normally detached movable or active terminal and multiple fixed or passive terminals, and a switching device for each line actuated by selecting and connecting magnets in separate local circuits and adapted to connect the movable terminals of the calling-line with the fixed terminals of the wanted line, of a source of current having one pole connected to the said fixed terminals of the wanted line when said line is engaged and the other pole connected with the movable terminal of the calling-line to form a testing-circuit adapted to be closed by connecting said terminals, and a differential relay for said calling-line controlling the said detached movable terminals thereof, the said relay having an exciting-coil in the connecting-magnet local circuit and a neutralizing-coil in said testing-circuit, and being adapted to become energized and to attach the said movable terminals to their respective line conductors, and to remain quiescent and maintain their detachment according as the engagement or disengagement of said wanted line may determine the presence or absence of neutralizing-current in the testing-circuit and the neutralizing relay-coil included therein, substantially as and for the purpose set forth.

12. In the central-station apparatus of an automatic telephone-exchange, the combination of a call-originating or calling-subscriber's line,

a call-receiving or wanted subscriber's line, and connecting mechanism for each, with a busy-signal tone current device in a normally open circuit, means actuated by said connecting mechanism of the calling-line for completing said open circuit through said calling-line, a relay-magnet for said calling-line adapted to become excited on the connection of said line with a disengaged wanted line, but to remain quiescent if said line be busy, and a switch-lever controlled by said magnet and adapted during the quiescence thereof to maintain the continuity of the busy-signal circuit, and on the excitation thereof to open the said busy-signal circuit at substantially the same instant at which it is closed by said connecting mechanism, substantially as described.

13. The combination in an automatic exchange system, of a substation-circuit having normally detached movable terminals, switching apparatus for connecting the said terminals with fixed terminals of another substation-circuit, an appliance for producing distinctive busy-signal currents, means actuated by said switching apparatus for connecting the same to the said first-named circuit, an electromagnetic switch associated with said switching mechanism controlling the said busy-signal apparatus and the said detached movable terminals and acting when quiescent to maintain the connection of the said busy-signal apparatus and the detachment of the said terminals, and when energized to disconnect the said busy-signal connection and unite the said terminals to their respective main-circuit conductors, and means for preventing the operation of said switch when said other substation-circuit is already engaged.

14. In an automatic telephone-exchange, the combination at the central station, with substation-lines having normally detached movable terminals and multiple fixed terminals any of which lines may be a line calling for another or a line wanted by another, and switching mechanism for each line actuated by selecting and connecting magnets in separate local circuits and operating to unite the movable terminals of a calling-line to the fixed terminals of a wanted line, of a battery or like source of current adapted to be attached to the fixed terminals of an engaged line by the normal operation of the switching mechanism establishing such engagement, an incomplete non-intrusion circuit for a calling-line to be completed through the said attached battery and fixed terminals of any engaged line when the movable terminals of said calling-line are connected therewith by the switching mechanism of said calling-line, a normally discontinuous busy-signal circuit and a tone-current-producing apparatus included therein, means actuated by the said calling-line switching mechanism for continuing said busy-signal circuit through said calling-line, and a differential discriminating relay for said calling-line having an operating-coil in the local circuit of said connecting-magnet a neutralizing or operation preventing coil in the non-intrusion circuit and two switching armature-levers adapted each to move between a back contact upon which it normally rests and a front contact and control respectively the non-interruption and busy-signal circuits as well as the connection of the calling-line main conductors withsaid their normally detached movable terminals, the said circuits leading through the said normal contacts, and the said connection leading through the said front contacts, substantially as and for the purposes specified.

15. In an automatic telephone-exchange, the combination of a main telephone-circuit normally open at its substation, central-station apparatus therefor comprising selecting mechanism adapted to bring the movable terminals of said circuit into juxtaposition to the fixed terminals of any desired other circuit, a quick-acting selecting-electromagnet to actuate and a slow-reacting electromagnet to control said selecting mechanism, connecting mechanism adapted to unite the said juxtaposed terminals, a connecting-electromagnet to operate said connecting mechanism, a main-line relay having a quick-acting armature capable of following rapid successive current-interruptions and controlling the said selecting-magnet and a sluggish armature responsive to a steady or sustained current only and controlling the said connecting-magnet, a source of current also in said main circuit, and substation devices comprising a switch for closing the main circuit through the telephone apparatus for the establishment of a sustained current from said source therein for the responsive operation of both armatures of said main-line relay, and a periodic circuit-breaker for interrupting or intermitting the said current when established, for the responsive intermittent operation of the quick-acting armature only of said relay, substantially as specified.

16. In an automatic telephone-exchange, a call-originating subscriber's circuit and a call-receiving or called subscriber's circuit one or both being a polystation-circuit and each having two main conductors, a switching or connecting device for each at the central station adapted to unite the said main conductors of each to those of the other and thereby constitute a compound or through circuit, electromagnetic call-bells associated one at each substation with the corresponding conductors of the respective circuits, a normally disconnected call-generator at each substation, a key therefor to connect the same with the other or complementary main conductor of each circuit, and a transposing-commutator for the calling-circuit at the central station operated by the said switching device thereof to transpose the conductors of the said calling-circuit, whereby a preliminary-call-signal circuit may be established comprising the said complementary main conductor of the calling-circuit and the bell main conductor of the called circuit and including the bell or bells of the said called circuit, and the generator at the calling-station of the calling-circuit but excluding the bells at all other stations of the said calling-circuit, substantially as set forth.

17. In an automatic telephone-exchange, two main conductors of a metallic circuit extending from a central station to a plurality of substations, an electromagnetic bell at each substation connected with one of said conductors, a magneto-electric call-generator at each of said substations normally disconnected from both conductors, a grounded battery and controlling-relay looped between said conductors at the central station, an individual switching device at said central station adapted to unite the said main conductors with those of other substation-circuits, two keys associated with each said substation-generator one adapted to connect the same with the bell main conductor of the same circuit to operate the bells at other stations thereof, and the other adapted to simultaneously ground said bell-conductor and thereby complete the circuit of said grounded battery and relay therethrough and to connect said generator to the other main conductor to operate the bells of a second circuit connected by said central-station switching device, and a transposing-commutator actuated by said switching device and acting to unite the said other main conductor to the bell-conductor of said second circuit, substantially as and for the purposes specified.

18. In an automatic telephone-exchange composed of polystation subscribers' circuits each having two main conductors one associated with the call-bells at the several circuit-substations and the other dissociated from said bells and an individual switching device at the central station for each circuit, a temporary signaling-circuit established between a call-originating and a wanted circuit by the action of the switching device of the former, and comprising the call-bell-associated main conductor of the wanted circuit, the station-call bells connected with said conductor each in a ground branch thereof, the said dissociated main conductor of the call-originating circuit grounded at the calling-station thereof, and a call-generator connected therein at said calling-station, substantially as described.

19. In an automatic telephone-exchange, the combination at each station of a polystation-line, of two main conductors, an electromagnetic bell included in a ground branch from one of them, a grounded call-generator in a normally incomplete circuit, two keys associated with said generator and with the said main conductors respectively and adapted to complete the said generator-circuit through their respective main conductors, and a normally open circuit connection extending between the ungrounded terminals of the bell and generator and adapted to be closed during the operation of said generator as a branch circuit thereof including the coils of said bell, whereby the said generator is enabled to ring the bell of its own station when operated in connection with either main conductor, as set forth.

20. In an automatic telephone-exchange, the combination of a compound talking-circuit between two substations formed by uniting the normal circuits of said substations at a central station, and comprising telephone apparatus at the said substations, a bridged source of current connecting through parallel impedance-coils on each side with the two main conductors respectively, and two shunted relays maintaining the connection of said constituent circuits and having their windings in series in one of the said main conductors, with means for balancing in the other main circuit-conductor the said shunted relays, and for regulating the amount of current supplied from said source to the two constituent circuits respectively as set forth.

21. In an automatic telephone-exchange, a compound talking-circuit between two substations formed of two constituent subscribers' circuits switched together at a central station, and comprising telephone apparatus at the said substations, a battery supplying current for said telephone apparatus bridged between the main conductors at the central station, two impedance-coils in series in each main conductor one on each side of said battery-bridge connection, two connection-maintaining condenser-shunted relays having their electromagnets in series in one of said main conductors, and a low-resistance conductor shunting the impedance-coils in the main conductor which contains said relays, combined with a balancing and regulating resistance shunting the impedance-coils in the other main conductor, substantially as specified.

22. In an automatic exchange, and in combination with the two main conductors of a polystation subscribers' line thereof, apparatus and circuit connections at each substation comprising an electromagnetic bell and condenser in a ground branch from one of the said main conductors, a balancing impedance corresponding to that of the magnet of said bell and a second condenser in a ground branch from the other main conductor, a switch serving as a telephone-receiver support and operated by the removal and replacement of said receiver, and two circuit-breakers connected respectively in the said bell and balancing earth branches and both controlled by said switch, substantially as described and for the purposes set forth.

709,741. GRAIN-DRILL. GEORGE H. BURRILL, Adaville, Iowa. Filed June 18, 1902. Serial No. 112,102. (No model.)

Claim.—1. The combination with the drill-tube, shoe and supporting-beams, of the colter arranged between the beams, the bifurcated bar carrying the colter, and a spring adapted to bear upon the said bar for the purpose of holding the colter in contact with the earth, as specified.

2. The combination with the drill-tube, shoe and beams, of a colter arranged between the beams, bifurcated bar carrying the colter, and the spring-rod, one end of which engages the said bar adjacent to its bifurcation, the other end engaging the beams, said spring-rod normally holding the colter in contact with the earth, substantially as specified.

3. The combination with the drill-tube, shoe and beams, of the colter arranged between the beams and having its axle adapted to engage the said beams, a bar bifurcated at one end and carrying a colter within said bifurcated end, and a spring-rod hooked at one end and adapted to engage the said bifurcated bar adjacent to its bifurcation, the opposite end being hooked or bent when brought into engagement with the under side of the beams for the purpose specified.

709,742. WRENCH. CHARLES BOBBY, Powell, Oreg. Filed Apr. 13, 1901. Serial No. 55,773. (No model.)

Claim.—In a wrench, the combination with the toothed bar having a handle and a removably-fixed jaw therewith, of a movable jaw having a sleeve therein mounted on said bar, the rear lower portion of the movable jaw having a dog pivoted thereto with a catch-leg thereon to coact with the teeth of the bar, an offset on said dog at right angles with the catch-leg so as to coact with the under surface of said teeth, a lip with a recess therein, a leaf-spring secured at one end to the movable jaw, the opposite end loosely connected in the recess of said lip and the sleeve of the movable jaw having spaced rollers at opposite ends to coact with the upper surface of the bar, and one of said rollers mounted above the movable jaw, the other above the dog whereby to equalize the movement of said dog and said movable jaw, substantially as specified.

709,743. TRACK-BRAKE. THOMAS S. BUTLER, Vandergrift, Pa. Filed Apr. 15, 1902. Serial No. 102,947. (No model.)

Claim.—1. The combination in a brake mechanism substantially as described, of the supporting-beams, the brackets secured thereto, and spaced apart and having at their upper ends the upright and horizontal wings lapping alongside the beam and the intermediate inwardly-inclined wings and the depending wings at the inner lower ends of the inclined wings the levers comprising side plates pivoted between their ends to the said depending wings of the brackets, and provided between the side plates near their inner adjacent ends with the weight-blocks and between their side plates near their outer ends with the brake-wheel movable vertically and with the bearing-blocks operating above said wheels, the shaft mounted in bearings on the beam, between the opposite brackets thereof, the drum on said shaft, connections between said drum and the inner adjacent ends of the brake-levers and means whereby the drum may be turned, substantially as set forth.

2. The combination in a brake mechanism with a supporting-beam, of the brackets secured at their upper ends to the supporting-beams and inclining inwardly below the said beams, the brake-levers pivoted between their ends to the lower ends of the said brackets and provided at their outer ends with the brake-wheels, and lifting means connected with the inner adjacent ends of the brake-levers, substantially as set forth.

3. The combination in a brake mechanism with a suitable support, of the lever pivoted thereto, and composed of side plates, a weight-block between the side plates of said lever on the long arm of said lever, and the brake-wheel and bearing-block supported between the side plates of the short arm of the lever, and means whereby the lever may be operated, substantially as set forth.

4. A brake substantially as described, comprising the lever, the brake-wheel movable in the lever and arranged to bear upon the track, and a bearing-block supported by the lever and arranged to set upon the opposite side of the wheel from the track, substantially as set forth.

5. The combination of the brake-lever provided with a lateral opening for the bearing-block, the bearing-block fitted in said opening, and the brake-wheel movable in the brake-lever below the bearing-block and toward and from the same, substantially as set forth.

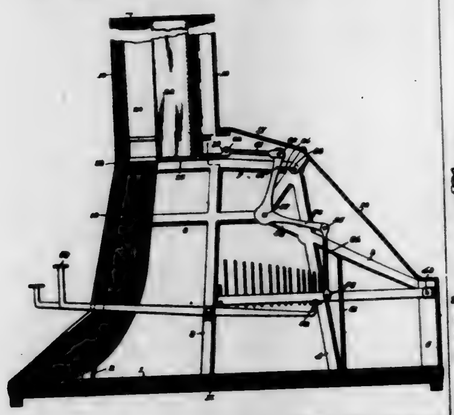
6. The combination of the brake-lever having the opposite side plates, and provided therein with the slots for the shaft of the brake-wheel and above said slots with the openings for the bearing-block, the bearing

block fitted and held in said openings, and the wheel below said bearing-block and having its shaft movable in the slots of the side plates, substantially as set forth.

7. The combination with the beam, of the levers below the same and pivoted near their outer ends, the brake-wheels and bearing-blocks in the outer ends of the said levers, and lifting devices connected with the inner ends of the levers, substantially as set forth.

8. In a brake mechanism, the combination of the bracket, the lever having side plates extending on opposite sides of and pivoted to the bracket, the brake-wheel and bearing-block between the said plates on one side of the bracket, and the lifting device connected with the lever on the opposite side of the bracket, substantially as set forth.

709,744. MECHANICAL MONEY-CHANGER. GEORGE W. CASTLEN, Owensboro, Ky. Filed Dec. 21, 1900. Serial No. 40,605. (No model.)



Claim.—1. In a money-changer the combination with a key operatively connected with a key-bar, said key-bar being pivoted at one end, of a connecting member provided with stirrups adapted to engage said key-bar near its opposite end and to actuate said key-bar independently of the operation of said key.

2. In a money-changer the combination with a key operatively connected with a key-bar, said key-bar being pivoted at one end, of a connecting member provided with stirrups adapted to engage said key-bar near its opposite end and to actuate said key-bar independently of the operation of said key, and a special key in operative connection with said connecting member.

3. In a money-changer, coin-selective mechanism, comprising the combination with a plurality of key-bars, pivoted at one end, respectively, and a connecting member adapted to operatively engage said key-bars near their free ends, respectively, of plungers, bell-crank levers linked to the plungers and key-bars, respectively, and keys operatively connected with the key-bars.

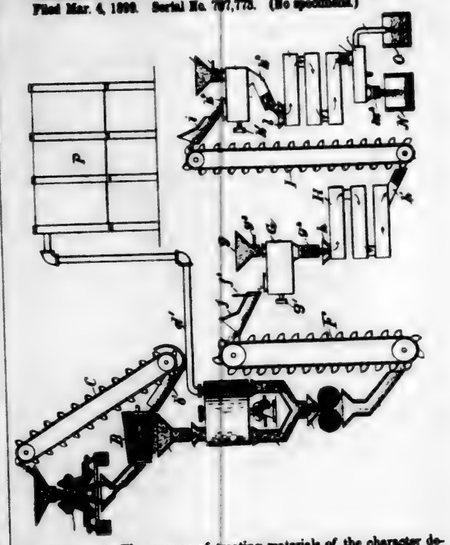
4. In a money-changer, coin-selective mechanism comprising the combination with a plurality of plungers, and a plurality of key-bars operatively connected with the plungers, respectively, of a connecting member provided with stirrups in which a plurality of key-bars work, and a special key-bar and key for actuating said connecting member, substantially as set forth.

5. In a money-changer, coin-selective mechanism comprising the combination with a case, of a key-bar terminally pivoted thereto, and plunger operatively connected therewith, a key operatively connected, by a lever connection, with the key-bar, and means for preventing lateral movement of the keys and key-bar, respectively, whereby during their respective movements, they are held in true operative relations.

6. As a part of a money-changer, a coin-bar-assembling member provided with a coin-bar recess, and a central plunger-guideway.

7. In a money-changer the combination with a case provided with means for containing coins of different denominations, of coin-selective mechanism comprising key-bars, plungers operatively connected with the key-bars, keys operatively connected with the key-bars, connecting members adapted to engage a plurality of said key-bars and to actuate them independently of the operation of their keys, said connecting member being provided with stirrups, and keys and key-bars adapted to actuate said connecting members, substantially as set forth.

709,745. PROCESS OF TREATING ORES AND BY-PRODUCTS CONTAINING SULFUR AND IRON. ARTHUR W. CHASE, Avoca, Iowa. Filed Mar. 4, 1899. Serial No. 707,773. (No specimens.)



Claim.—1. The process of treating materials of the character described, which consists in subjecting said ores or ash to the action of heat and a suitable reducing agent, whereby the iron is completely changed to an insoluble form, and whereby the sulfur is either volatilized or reduced to a soluble form, and leaching out the residual soluble sulfur salts, substantially as described.

2. The process of treating materials of the character described, which consists in mixing said ores or ash with carbonaceous material and roasting the mixture, whereby the iron is changed to insoluble oxids and the sulfur is either volatilized or changed to a soluble salt or salts, and leaching out the soluble salts, substantially as described.

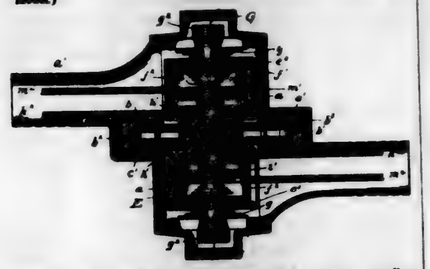
3. The process of treating materials of the character described, which consists in pulverizing said ore or ash, mixing it with finely-divided carbonaceous material, heating the mixture to a full-red heat with free access of air, stirring the mixture during the roasting operation, whereby the iron is changed to insoluble oxids and the sulfur is either volatilized or changed to a soluble salt or salts, and leaching out the soluble salts, substantially as described.

4. The process of treating materials of the character described, which consists in mixing said ore or ash with carbonaceous material, roasting said mixture until the sulfur contained therein is reduced to a percentage equal to or slightly in excess of the copper contained in said ores or ash, mixing with the product a quantity of common salt chemically equivalent to the quantity of copper present, roasting this mixture and leaching out the soluble salts, substantially as described.

5. The process of treating materials of the character described, which consists in pulverizing said ores or ash, mixing them with finely-divided carbonaceous material, roasting said mixture at a full-red heat with free access of air, stirring said mixture during the roasting operation until the sulfur is reduced to a percentage equal to or slightly in excess of the copper present, mixing the product with a quantity of common salt chemically equivalent to the quantity of copper present, roasting said mixture at a dull-red heat, mechanically stirring the same, leaching out the soluble salts and treating the solution thus obtained and the residue by any of the well-known methods for the recovery of the valuable constituents thereof, substantially as described.

6. The process of treating materials of the character described, which consists in roasting them with the admission of a suitable quantity of air for the production of sulfuric acid, pulverizing the ash therefrom, mixing said pulverized product with a small percentage of finely-divided carbonaceous material, roasting said mixture at a full-red heat with free access of air, mechanically stirring said mixture during said roasting operation, mixing the roasted material with a quantity of common salt chemically equivalent to the copper present, roasting the mixture at a dull-red heat with free access of air, mechanically stirring said mixture during the roasting operation, subjecting the product to the action of hot water and steam under pressure, thereby forming a solution of all the soluble salts present, and treating the solution and residue by any of the well-known methods to obtain the valuable constituents thereof, substantially as described.

709,746. TRAIN SIGNALING APPARATUS. WILLIAM D. CLOSTON, Lewisburg, W. Va. Filed Jan. 23, 1902. Serial No. 90,879. (No model.)



Claim.—1. In a device of the class specified, a pair of coupling members each having two contact-blocks connected to line-wires and separated from each other when the coupling members are connected, and means for automatically moving said blocks into contact with each other to complete a circuit between the line-wires when the coupling members are separated.

2. A slip-coupling for connecting the wires of an electric circuit between the cars of a train, said coupling comprising two similarly-shaped, interfitting sections, each having two contact-blocks forming the terminals of an electric circuit and springs carried by each section tending to cause the parts to lock together laterally, and when so locked to separate the two blocks of each section, the two said sections being free to separate longitudinally under a tensional strain and the springs serving to connect said blocks and establish a circuit when the sections are separated, substantially as specified.

3. A coupling for connecting the wires of an electric circuit between the cars of a train said coupling comprising two similarly-shaped interfitting sections, each section having an outer shell or casing, two metallic contacts situated within said casing and electrically connected to the line-wires of the circuit, and springs acting in said contacts and tending to connect the same when the coupling-sections are separated, substantially as specified.

4. A coupling-section comprising a casing, having an integral ribbed and grooved portion for connection with the similar portions of the mating section, metallic contact-plates within and insulated from said casing, and springs acting on said plates to effect the lateral locking of the sections and tending to connect said plates when the sections are separated, substantially as specified.

5. A coupling member comprising an outer shell or casing having an opening at one end, a cup fitting in said casing and partly projecting through said opening, a spring tending to thrust said cup outwardly, a pin located within said cup and having its end projecting through an opening in the same, a spring tending to force said pin through said opening, and insulating material within the cup to prevent contact between the sides of the same and the pin, substantially as specified.

6. The combination in a coupling member, of the casing, an insulated cup within the casing and forming part of an electric circuit, a spring-projected pin within and partly insulated from said cup, and forming part of an electric circuit, said cup and pin being both projected through an opening in the casing, but at different distances from the surface of the same, substantially as specified.

7. A coupling member comprising a casing, having an end opening, a cup fitting within the casing and partly projecting through the opening, and electrical conductor connected to said cup, a pin within and insulated from said cup, an electrical conductor connected to said pin, and a spring tending to force the pin and cup into contact to complete a circuit between said conductors, substantially as specified.

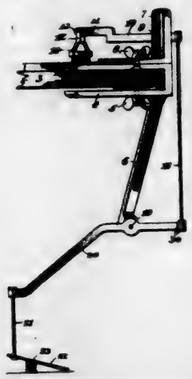
8. A coupling member comprising a casing *e*, a cup E within the same, a spring tending to force said cup through an opening in the casing, insulation *f*, *f'* in said cup, a headed pin *i*, *i'* within the cup and projecting partly through an insulated opening in the same, a spring *n* between the top of the pin and the cup, and electrical conductors connected to said cup and pin, substantially as specified.

709,747. TAKE-UP DEVICE FOR AXLE-SPINDLES. JOHN J. COOK, Columbus City, Iowa. Filed Oct. 30, 1900. Renewed July 11, 1902. Serial No. 115,213. (No model.)

Claim.—1. In devices for taking up wear in worn axle-spindles, the nut having a recessed inner face provided with a series of removable washers therein arranged to bear against the shoulder of the spindle, said nut having also a second recess in its inner face, and provided with a spring-washer arranged to bear against the shoulder of the boxing, substantially as specified.

2. In a device for taking up wear in axle-spindles, the combination with the nut engaging the end of said spindle, and having a recess in its inner face, of a face attachment for said nut, having also a recess in its inner face, and the washers in said recesses, arranged to bear against shoulders of the spindle and boxing, substantially as specified.

709,748. SHIFT-KEY-ACTUATING DEVICE. ROBERT S. COPP, New York, N. Y. Filed June 24, 1902. Serial No. 113,040. (No model.)



Claim.—1. The combination with a clamp member, an angle-piece thereon, shift-key-operating lever, a leaf-spring to normally hold the lever retracted, and treadle mechanism to actuate the said lever, substantially as described.

2. The combination with a clamp member having a depending arm, an adjustable angle-piece thereon, a spring-retracted shift-key-operating lever carried by said angle and treadle mechanism to operate the said lever, substantially as described.

3. The combination with a clamp member having a depending arm, of an angle-piece adjustably secured thereto, a spring-retracted shift-key-operating lever, a treadle-actuated lever pivoted on the depending arm and a connection between the two levers, substantially as described.

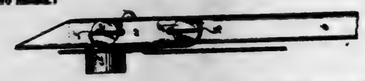
4. The combination with a clamp member having a depending arm, of an angle-piece adjustably secured thereto, a spring-retracted shift-key-operating lever having an end adapted to engage and hold the shift-key,

a treadle-actuated lever pivoted on the depending arm and a connection between the two levers.

5. The combination with a clamp member having a depending arm, of an angle-piece adjustably secured thereto, a slotted pivot-pin in the angle, a shift-key-operating lever pivoted on the pin, a leaf-spring held in said slot and holding said lever normally retracted, a treadle-operated lever pivoted on the depending arm and an adjustable connection between said lever and the shift-key-operating lever, substantially as described.

6. The combination with a suitable support to be clamped to a table or stand, of a shift-key-operating lever pivoted on the support, a finger pivoted on the end of the lever and provided with claws to engage and hold the shift-key, and treadle mechanism to operate the said lever, substantially as described.

709,749. COMBINATION-TOOL FOR MANIPULATING WIRE. EDWIN C. COLLIER, Colorado, Tex. Filed Feb. 8, 1902. Serial No. 93,161. (No model.)



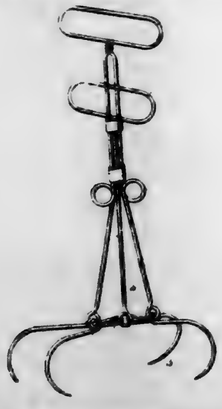
Claim.—1. A combination-tool for manipulating wire, comprising a handle, a bifurcated claw, a plurality of formers provided with slots for engaging the wire, and a cylindrical boss for temporarily securing said wire to the tool.

2. A combination-tool for manipulating wire, comprising a handle, a bifurcated claw, a plurality of formers provided with slots for engaging the wire, a cylindrical boss for temporarily securing said wire to the tool, a longitudinal arm disposed at right angles to said handle, and a comb flexibly connected with the said longitudinal arm for the purpose of temporarily engaging the wire.

3. A combination-tool for manipulating wire, comprising a longitudinal member provided with a handle, and with a pair of substantially cylindrical formers disposed parallel with each other and provided with slots, said slots being in alinement, and also provided with a cylindrical boss disposed with its axis at a right angle to the axes of the said cylindrical formers.

4. A combination-tool for manipulating wire, comprising a lever made of two longitudinal members disposed at right angles to each other, one of said members being provided with a comb flexibly connected therewith, and the other being provided with a bifurcated claw, a cylindrical boss, a pair of substantially cylindrical formers provided with slots, said slots being in alinement with each other and all for manipulating wire, and a fastening for temporarily securing said comb in a folded position when the same is not in active use.

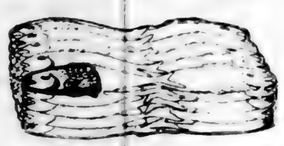
709,750. GRAPPLE. ARTHUR DAILY and RILEY BAKER, Otisco, Ind. Filed Apr. 26, 1902. Serial No. 104,632. (No model.)



Claim.—1. A grapple comprising a strand formed intermediate its ends with a loop, the free ends being run parallel to each other for a suitable distance and thence bent to form spring-arms, and finally terminating in spring-arms, jaws connected to the ends of the spring-arms, and a reciprocating rod connected to each of the jaws and adapted to be operated so as to open and close said jaws.

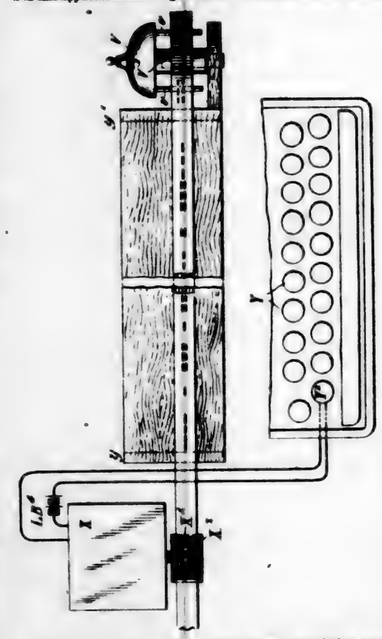
2. In a grapple, the combination with a pair of spring-actuated jaws, rods extending above the spring and connected at the top by a loop, said rods being spaced apart, a rod interposed between the first-named rods and connected to the jaws so as to operate them, and sleeved clips secured to the first-named rods and encircling the last-named rod, whereby it may be guided in a reciprocating relation to the device.

709,751. PROCESS OF PRESERVING FROZEN FOOD PRODUCTS. DAVID W. DAVIS, Detroit, Mich., assignor to Sidney R. Dixon, trustee, Detroit, Mich. Filed May 21, 1902. Serial No. 108,318. (No specimens.)



Claim.—The herein-described process of preserving fresh animal-food products, consisting in first freezing the products to a temperature below freezing-point, then immersing the said products while in a frozen condition in water having a temperature of 32° Fahrenheit to form an inclosing shell of ice about the products to thoroughly exclude the air therefrom without extracting the frost from the products, and finally storing the products thus prepared without further treatment in a temperature below freezing-point, substantially as and for the purpose specified.

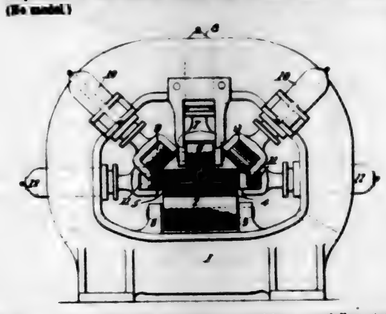
709,752. MEANS FOR HANDLING TELEGRAPHIC RECEIVING-TAPES FOR TRANSLATION. PATRICK B. DELANY, South Orange, N. J. Original application filed Dec. 18, 1896, Serial No. 615,796. Divided and this application filed Aug. 20, 1901. Serial No. 72,622. (No model.)



Claim.—1. A telegraphic receiving-tape-translating mechanism comprising the combination of a reel upon which the receiving-tape is wound, a drawing device adapted to be intermittently actuated at the will of the operator to draw from the reel a definite length of tape, means by which the operator may manually control the operation of the drawing device, and a board or support between the reel and drawing device upon which the lengths of tape successively lie in view of the operator.

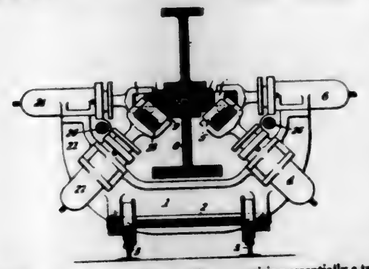
2. A telegraphic receiving-tape-translating mechanism comprising the combination of a board or tape-support upon which the tape may be in view of the operator, a drawing device arranged at one side of the board and adapted to be intermittently actuated at the will of the operator to draw a definite length of the tape across the board, and means by which the operator may manually control the operation of the drawing device.

709,753. METAL-BENDING MACHINE. FRANK DEVENFIELD, Avalon, Pa., assignor to Pressed Steel Car Company, Pittsburg, Pa., a Corporation of New Jersey. Filed July 1, 1902. Serial No. 113,961. (No model.)



Claim.—A metal-bending machine, comprising essentially a stationary frame, a power-actuated holddown-roll, power-actuated edge-turning rolls arranged in pairs upon opposite faces of the frame, flanging-rolls arranged upon opposite sides of the frame and between the edge-turning rolls, and a movable former mounted upon the frame between said rolls.

709,754. METAL-BENDING MACHINE. FRANK DEVENFIELD, Avalon, Pa., assignor to Pressed Steel Car Company, Pittsburg, Pa., a Corporation of New Jersey. Filed July 1, 1902. Serial No. 113,962. (No model.)



Claim.—1. A metal-bending machine, comprising essentially a traveling frame provided with obliquely-disposed edge-turning rolls and horizontally-arranged flanging-rolls, a stationary former, a bed-piece, and a pressure-beam between which and the former the work is clamped.

2. A metal-bending machine, comprising essentially a traveling frame provided with obliquely-disposed edge-turning rolls and horizontally-arranged flanging-rolls, a stationary former, a pressure-beam upon which it is mounted, and a bed-piece between which and the former the work is clamped.

709,755. CENTER-BEARING FOR RAILWAY-CARS. FRANK DEVENFIELD, Avalon, Pa., assignor to Pressed Steel Car Company, Pittsburg, Pa., a Corporation of New Jersey. Filed July 1, 1902. Serial No. 113,963. (No model.)

Claim.—1. A center-bearing plate, for railway-cars, having a projecting member of any desired height and conformation, and a base member shrunk thereon.

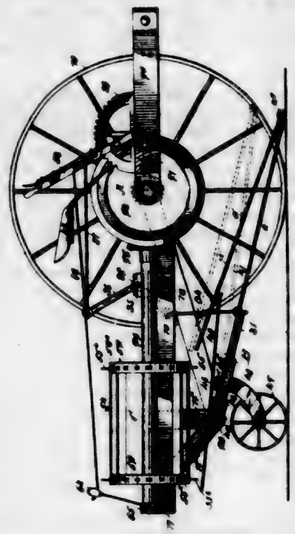
2. A pressed-steel center-bearing plate, having a central projecting member of appropriate height and profile, and a base having a horizontal flange and a vertical flange fitted to the projecting member and shrunk thereon.

3. Center-bearing plates for cars, comprising a body member and a truck member, each composed of a projecting portion of appropriate height and profile, and a base portion, the several base portions being shrunk upon the projecting portions.

4. A center-bearing plate for cars, having a projecting portion of appropriate height and profile, and a base portion, the base portion being shrunk upon the projecting portion, combined with a reinforcing-annulus.

5. A center-bearing plate for cars, comprising a projection of appropriate height and profile having a flanged king-bolt hole, and a base shrunk upon the projection.

709,756. HAY RAKE AND LOADER. EDWARD D. DORSEY, Ovando, Mont. Filed Sept. 3, 1901. Serial No. 74,067. (No model.)



Claim.—1. The combination of a main frame, a wheeled rake-head connected therewith, means for adjusting said rake-head relative to said main frame, a table in operative relation to the rake-head, rake-fingers each having upper and lower members and said lower members connected to the rake-head and the upper members arranged to discharge a load to said table, horizontal shafts over said table, and a conveyer supported and driven by said shafts and arranged to sweep the table.

2. The combination of a wheeled rake-head, a substantially horizontal table supported by and arranged above said rake-head, double rake-fingers each having the lower member loosely connected to the rake-head and with the upper member arranged to extend over said table, a conveyer having teeth arranged to sweep the table, means for propelling the conveyer in a horizontal path, and means for adjusting the rake-head and the table relative to said conveyer.

3. In a hay rake and loader, a rake-head, teeth constructed of spring-wire carried by the said head, each tooth comprising a lower member and an upper member diverging from the lower member, each tooth having an upward bend where the members connect at a forward end of the tooth, the lower member of each tooth resting loosely in guide-recesses in the rake-head, a device for securing the rear ends of the lower members of the teeth to the rear portion of the rake-head, and a binding-strip extending from end to end of the rake-head over the lower members of the teeth, being secured to the said head at the spaces between the teeth, the said binding-strip having arched sections over each teeth, so that each tooth is capable of limited upward movement, as described.

4. In a hay rake and loader, a rake-head, teeth constructed of spring-wire carried by the said head, each tooth comprising a lower member and an upper member diverging from the lower member, each tooth having an upward bend where the members connect at a forward end of the tooth, the lower member of each tooth resting loosely in guide-recesses in the rake-head, a device for securing the rear ends of the lower members of the teeth to the rear portion of the rake-head, and a binding-strip extending from end to end of the rake-head over the lower members of the teeth, being secured to the said head at the spaces between the teeth, the said binding-strip having arched sections over each teeth, so that each tooth is capable of limited upward movement, a wheel-supported frame

upon which the rake-head is pivotally mounted, and a shifting device carried by the said frame and connected with the rake-head, whereby the rake-head may be raised and lowered, and all of the teeth simultaneously raised and lowered, as described.

5. In a hay rake and loader, the combination, with a wheeled driving-axle, a frame supported thereon, a shaft extending from side to side of the frame, a drive-shaft extending from front to rear of the frame, and a driving connection between the drive-shaft and driving-axle of the frame, of a rake-head pivotally mounted on the shaft extending from side to side of the frame, the rake-head being provided with a series of spring-teeth capable of independent vertical movement, a table located over the rake-head, center-wheel supports for the rake-head, a conveyer located over the said table and extending from end to end thereof, an elevator located at one side of the frame at one end of the conveyer, and means, substantially as described, for imparting movement to the conveyer and elevator aprons through the medium of the said driving-shaft, for the purpose set forth.

6. In a hay rake and loader, the combination, with a wheeled driving-axle, a frame supported thereon, a shaft extending from side to side of the frame, a drive-shaft extending from front to rear of the frame, and a driving connection between the drive-shaft and driving-axle of the frame, of a rake-head pivotally mounted on the shaft extending from side to side of the frame, the rake-head being provided with a series of spring-teeth capable of independent vertical movement, a table located over the rake-head, center-wheel supports for the rake-head, a conveyer located over the said table and extending from end to end thereof, an elevator located at one side of the frame at one end of the conveyer, and means, substantially as described, for imparting movement to the conveyer and elevator aprons through the medium of the said drive-shaft, a shifting shaft mounted on the frame and connected with the rake-head, a lever connected with the shifting shaft, a pulley-controlled regulating rope or chain connected with the elevator, and a lever connected with the said pulley-controlled rope or chain, for the purposes set forth.

7. The combination of a wheeled axle, a frame, a pivotal shaft or rod supported by said frame, a rake-head connected to said shaft, a table over said rake-head and projecting in front and in rear of the same, rake-fingers connected to the rake-head and provided with upper members arranged to deliver to the table, horizontal conveyer-shafts mounted on the frame, a conveyer supported and driven by said shafts and arranged to travel lengthwise of the table and in a path crosswise of the series of rake-fingers, and means for adjusting said rake-head and the rake-fingers carried thereby.

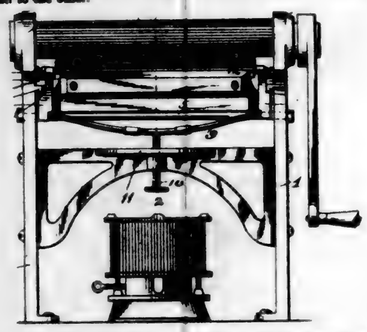
8. The combination of a wheeled axle, a frame, a rake-head suspended from said frame and supported by ground-casters, a table over said rake-head, rake-fingers each having two members, one series of said members of the rake-fingers being loosely connected to the rake-head and the other members of said fingers arranged to extend over the table, rake-head-adjusting devices on said frame, and a conveyer mounted on the frame and arranged to travel lengthwise of the table.

9. The combination of a wheeled axle, a frame, a horizontal conveyer-driving shaft geared to said axle, another horizontal conveyer shaft mounted on the frame, an endless conveyer fitted to said shafts and arranged to travel in a horizontal path, a rake-head and the rake-fingers below the conveyer mechanism, said rake-fingers having the upper members, a table supported between the conveyer and the rear ends of the upper members of the rake-fingers, said table extending in front and in rear of said rake-head, an inclined elevator having one end mounted on the frame and disposed in loading relation to the table and the conveyer, means for driving the elevator, and elevator-adjusting devices on the frame.

709,757. PHOTOGRAPH-BURNISHER. CLATHIA J. DORTSON, Newton, N. J., assignor to the Dortson Manufacturing Co., a Corporation of Colorado. Filed Aug. 18, 1902. Serial No. 27,104. (No model.)

Claim.—1. The herein-described means for burnishing photographs, embracing two rollers, to bear on opposite surfaces of the photograph, one of said rollers acting to feed the photograph and engaging the card side thereof, and the other of said rollers being heated when in use and constituting the burnishing-roller of the device and engaging the print side of the photograph, said burnishing-roller being free to rotate under the influence of the moving photograph being fed in contact with it and being rotated thereby at the same speed as the feed-roller, whereby the friction on the photograph produced by gearing connecting the two rollers is eliminated, as and for the purposes set forth.

2. The herein-described means for burnishing photographs, embracing two rollers, to bear on opposite surfaces of the photograph, one of said rollers acting to feed the photograph and engaging the card side thereof, and the other of said rollers being heated when in use and constituting the burnishing-roller of the device and engaging the print side of the photograph, said burnishing-roller being free to rotate under the influence of the moving photograph being fed in contact with it and being rotated thereby at the same speed as the feed-roller, whereby the friction on the photograph produced by gearing connecting the two rollers is eliminated, and means for supporting one of said rollers yieldingly with relation to the other.



3. The herein-described means for burnishing photographs, embracing two rollers, to bear on opposite surfaces of the photograph, one of said rollers acting to feed the photograph and engaging the card side thereof, and the other of said rollers being heated when in use and constituting the burnishing-roller of the device and engaging the print side of the photograph, said burnishing-roller being free to rotate under the influence of the moving photograph being fed in contact with it and being rotated thereby at the same speed as the feed-roller, whereby the friction on the photograph produced by gearing connecting the two rollers is eliminated, a spring supporting one of said rollers yieldingly with relation to the other, and an adjusting-screw engaging said spring.

4. A combined rotary and stationary photograph-burnisher, comprehending, in combination, a feed-roller and a support for the burnishing-tool, relatively adjustable to give access to the burnishing-tool, said support being adapted to both rotary and stationary burnishing-tools, and a burnishing-tool adapted to said support and removably mounted therein.

5. A combined rotary and stationary photograph-burnisher, comprehending, in combination, a feed-roller and a support for the burnishing-tool, relatively adjustable to give access to the burnishing-tool, said support being adapted to both rotary and stationary burnishing-tools, a spring attached to the adjustable part at its ends and yieldingly supporting the same during the burnishing operation, an adjustable abutment for said spring mounted so as not to interfere with said adjustment, and a burnishing-tool adapted to said support and removably mounted therein.

6. A combined rotary and stationary photograph-burnisher, comprehending, in combination, a feed-roller and a support for the burnishing-tool, relatively movable to give access to the burnishing-tool and said support being adapted to both rotary and stationary burnishing-tools, and a burnishing-roller journaled in said support and adapted to be removed therefrom, said burnishing-roller being disconnected from said feed-roller.

7. In a photograph-burnisher, the combination with a frame, a feed-roller, and a burnishing-tool, of a support for said tool, engaging said frame and slidably mounted to permit it to be moved bodily rearward thereon from beneath said feed-roller, for the purpose set forth.

8. In a photograph-burnisher, the combination with a feed-roller, and a burnishing-tool, of a support for said tool, slidably mounted to permit it to be moved from beneath said feed-roller to thereby afford access to said burnishing-tool, a spring attached at its ends to said support, and an abutment for the center of said spring.

9. In a photograph-burnisher, the combination with a feed-roller, and a frame, of a support for the burnishing-tool engaged with said frame and slidably mounted thereon so as to permit it to be moved bodily rearward out of line with said feed-roller, and a burnishing-tool removably mounted in said support.

10. In a photograph-burnisher, the combination with a feed-roller, a slidably-mounted support for the burnishing-tool, a burnishing-tool removably mounted in said support, a spring yieldingly supporting said tool-support and having its ends attached to the same, and an adjustable abutment which bears against the center of said spring.

11. In a photograph-burnisher, the combination with the feed-roller, and a burnisher-roller disconnected from said feed-roller, of a support for said burnishing-roller slidably mounted to enable the burnishing-roller to be carried out of line with said feed-roller to thereby afford unobstructed access to said burnishing-roller.

12. In a photograph-burnisher, the combination with the feed-roller, and a burnishing-roller disconnected from said feed-roller, of a support for said burnishing-roller, slidably mounted to enable the burnishing-roller to be carried out of line with said feed-roller to thereby afford unobstructed access to said burnishing-roller, and a spring attached at its ends to said support and yieldingly supporting the burnishing-roller during the burnishing operation, and an adjustable abutment for the center of said spring.

13. A combined rotary and stationary photograph-burnisher, comprehending, in combination, a feed-roller, a support for the burnishing-tool, slidably mounted to permit it to be moved out of line with said feed-roller to give access to the burnishing-tool and adapted to both rotary and stationary burnishing-tools, and a burnishing-tool removably mounted in said support.

14. A combined rotary and stationary photograph-burnisher, comprehending, in combination, a feed-roller, a support for the burnishing-tool slidably mounted to permit it to be moved out of line with said burnishing-tool, a spring attached at its ends to said support, an adjustable abutment bearing against the center of said spring, and a burnishing-tool removably mounted in said support.

15. In a photograph-burnisher, the combination with the frame and feed-roller, of a support for a burnishing-tool, mounted to be moved from beneath said feed-roller, a spring engaging the front end of said burnishing-tool support and supporting the same yieldingly with relation to the feed-roller, an adjusting-screw engaging said spring, a burnishing-tool removably mounted in said support, a rod to support the rear end of the burnisher-support, and coöperating guide-flanges and stop-lugs on the tool-support and frame.

16. A combined rotary and stationary photograph-burnisher, consisting of a frame, a feed-roller, a support for a burnishing-tool adapted to both rotary and stationary tools and mounted to be moved from beneath said feed-roller, a burnishing-tool adapted to said support and removably mounted therein, a spring engaging the front end of said support and supporting the same yieldingly with relation to the feed-roller, an adjustable abutment for said spring, means for supporting the rear end of said tool-support, and coöperating guide-flanges and stop-lugs on the frame and tool-support.

17. A combined burnishing and bending tool for photograph-burnishers having a burnishing-surface provided with means for determining its position within the burnisher, the relation of the burnishing-surface to said means being such that the burnishing-surface will be permanently inclined when mounted in the burnisher.

18. The combination with a feed-roller and a tool-support, of a stationary burnishing-tool mounted in said support and having its axis alined with that of said feed-roller, said burnishing-tool having its upper surface formed to present a continuous incline from its front to its rear side and its said rear side arranged at a greater distance from said support than its front side.

19. A burnishing-tool having one surface formed flat and plane for regular work and another surface formed in a continuous incline from one side to the other, said tool being constructed so that it may be adjusted in its support to present either of said surfaces and be held fixedly in adjusted position.

20. A burnishing-tool having one side formed to both burnish and bend a photograph and another surface formed simply to burnish, and a support for said tool, said tool being adapted to be mounted in said support so that it may be turned to present either of said surfaces to the photograph.

21. In a photograph-burnisher, the combination with a frame and a feed-roller, of a fire-pan, having ends which project beyond the edges of said pan and are mounted to slide with said pan bodily rearward from beneath said feed-roller, a burnishing-tool carried by said pan, a spring attached to the projecting parts of said ends and adapted to support the pan and tool yieldingly in relation to the feed-roller in the operation of the device, an adjustable abutment for said spring, and coöperating guide-flanges and stop-lugs on said frame and ends.

22. A photograph-burnisher, comprehending, in combination, a feed-roller, a burnishing-roller having a rigid burnishing-surface, and means for heating said burnishing-roller, said feed-roller and burnishing-roller being disconnected from each other and so related that the latter will be rotated from the former by the movement of the interposed photograph, whereby the friction due to gearing will be eliminated, as and for the purpose specified.

23. A photograph-burnisher, comprehending, in combination, a feed-roller, a burnishing-roller having a rigid burnishing-surface, means for heating said burnishing-roller, and means for supporting one of said rollers yieldably with relation to the other, said feed-roller and burnishing-roller being disconnected from each other and so related that the latter will be rotated from the former by the movement of the interposed photograph, as and for the purpose specified.

24. A photograph-burnisher, comprehending, in combination, a feed-roller, a burnishing-roller having a rigid burnishing-surface, means for heating said burnishing-roller, a spring connected at its ends with one of said rollers for yieldingly supporting the same, and an abutment for said spring, adjustably mounted to adjust the tension of said spring, said feed-roller and burnishing-roller being disconnected from each other and so related that the latter will be rotated from the former by the movement of the interposed photograph, as and for the purpose specified.

709,758. RADIATOR. ASCHER ROSENBERG, Orange, N. J. Filed Apr. 18, 1901. Serial No. 56,057. (No model.)

Claim.—1. A radiator, comprising a number of radiator-sections joined together to have unrestrained intercommunication at their lower portions, a steam-lead pipe passing into one end of the radiator at the bottom thereof and projecting longitudinally along the radiator to a point intermediate the ends thereof, at which point the lead-pipe discharges the steam, said pipe coacting with the radiator-sections as explained, and an air-cock for each of said divisions of the radiator.

2. A radiator, comprising a number of radiator-sections joined together to have unrestrained intercommunication at their lower portions, a steam-lead pipe passing into one end of the radiator at the bottom thereof and projecting longitudinally along the radiator to a point intermediate the ends thereof, at which point the lead-pipe discharges the steam, said pipe coacting with the radiator-sections as explained, and an air-cock for each of said divisions of the radiator, the said steam-lead pipe having an orifice in its bottom portion directly adjacent to the end of the radiator through which the lead-pipe passes, such orifice serving to conduct away the water of condensation.

3. In a radiator, the combination with the radiator-sections and an air-valve attached thereto, of a thimble fastened in one end of the radiator, said thimble having an eccentric orifice therein adjacent to the lower side of the thimble, and a steam-lead pipe fastened in the orifice of the thimble and projecting into the radiator, and said lead-pipe having an orifice in its lower side directly adjacent to the thimble, whereby to carry off the water of condensation.

4. In a radiator, the combination with the radiator-sections and an air-valve attached thereto, of a thimble fastened in one end of the radiator, said thimble having an eccentric orifice therein adjacent to the lower side of the thimble, and a steam-lead pipe fastened in the orifice of the thimble and projecting into the radiator, and said lead-pipe having an orifice in its lower side directly adjacent to the thimble, whereby to carry off the water of condensation.

5. A radiator formed of a number of radiator-sections fastened together to have unrestrained intercommunication at their lower portions, a thimble fastened in one end of the radiator at the lower portion thereof, a steam-lead pipe fitted in an eccentric orifice in the thimble, said orifice being near the lower side thereof and the lead-pipe projecting into the radiator to a point intermediate its ends, at which point the steam is discharged, for the purpose specified, and the steam-lead pipe having an orifice in its under side directly adjacent to the thimble to carry off the water of condensation, and an air-valve for each of said divisions of the radiator.

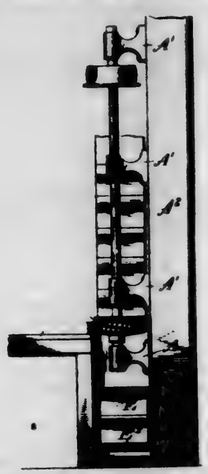
709,759. TRY-SQUARE. PETER H. ELLENBERGER, Belvidere, N. J. Filed Apr. 24, 1902. Serial No. 104,681. (No model.)

Claim.—1. A straight-edge implement having an arm provided with a dovetail channel in its upper side, parallel with its straight edge, a bar fitted and disposed to slide in said channel, and an arm 16 secured on said bar, bearing on the arm of the implement and having its outer portion bent to engage the straight edge thereof and formed with a scribing edge 16ª, substantially as described.

2. A straight-edge implement having an arm provided with a longitudinal channel parallel with its straight edge, a bar fitted and disposed to slide in said channel, and a scriber secured to said bar and having a

downturned blade extending across and disposed to travel on the straight edge and having a scribing edge 10° projecting below the lower side of the arm of said implement, substantially as described.

709,760. SEED-CAKE TRIMMER. SAMUEL J. ELLIS and CHRISTEN HELGEN, Memphis, Tenn. Filed Nov. 26, 1901. Serial No. 83,743. (No model.)



Claim.—1. In a seed-cake trimmer, a support, a vertically-disposed driving-shaft at one side thereof, and a cutter-head thereon provided with teeth disposed diagonally to the plane of the support, substantially as specified.

2. In a seed-cake trimmer, a support, a vertically-disposed driving-shaft at one side thereof, a cutter-head thereon provided with teeth disposed diagonally to the plane of the support, and a series of grooves extending laterally of said teeth and through the same; substantially as specified.

3. In a seed-cake trimmer, a support, a vertically-disposed driving-shaft at one side thereof, a cutter-head thereon at one side of said support and provided with teeth disposed diagonally to the plane of the support, and a series of grooves extending laterally of said teeth and through the same at substantially a right angle to the inclination thereof; substantially as specified.

4. In a seed-cake trimmer, a support or table, a vertical driving-shaft at one side thereof, a toothed cutter-head carried by said shaft, and provided with teeth disposed diagonally to the plane of said support, a guard having an opening next said support and surrounding said head, an inclined discharging-wall to said guard beneath the head, an open collecting-receptacle to receive from the lower end of said wall, and a conveyer adapted to remove material from said collecting-receptacle and having a roller-bearing therein; substantially as specified.

709,761. ENVELOP-SEALING MACHINE. HARRY E. GAVITT, Topeka, Kans. Filed Nov. 14, 1901. Serial No. 82,220. (No model.)

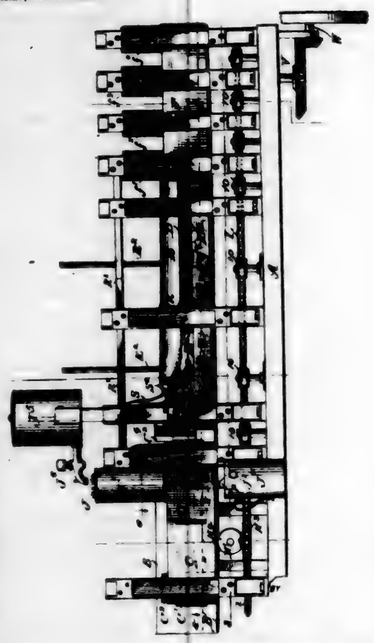
Claim.—1. In a machine for sealing envelops the combination of the hopper provided at one side with an infeed-belt and at its opposite side with a gage-plate whose rear end may be adjusted relatively to the infeed-belt, means for operating the infeed-belt, and means for moistening, turning and sealing the flap, substantially as set forth.

2. In a machine for sealing envelops a hopper arranged to support envelops edgewise and provided at one side with an adjustable gage-plate which may be set laterally with relation to the thickness of the envelops to be sealed, substantially as set forth.

3. An envelop-sealing machine having its hopper arranged to support envelops edgewise and provided at one side with a gage-plate standing longitudinally at an inclined angle to the direction of length of the machine, means for adjustably supporting the gage-plate and means for feeding the envelops substantially as set forth.

4. In an envelop-sealing machine a hopper provided transversely across its bottom with the feed-roller projecting into the hopper and arranged to operate upon the lower edges of the envelops, means for operating the said roller, and gage devices for controlling the discharge of the envelops from the hopper substantially as set forth.

5. A machine substantially as described provided with means for moistening and sealing the flaps of the envelops and having a hopper provided at one side with an adjustable gage-plate, at its opposite side with an infeed-belt, and at its bottom with a transverse feed-roller, substantially as set forth.



6. In an envelop-sealing machine the combination with a suitable framing of the hopper provided at one side with an adjustable gage-plate and at its opposite side with the infeed-belt, the intermediate carrier-belt and the sealing-belt in line with each other and in rear of the infeed-belt, the main carrier-belt lying opposite the sealing-belt, the intermediate belt and the inner end of the infeed-belt, means for driving the belts, flap-turning devices, and flap-moistening devices substantially as set forth.

7. In a machine substantially as described the combination of means for feeding the envelops and for moistening the flaps thereof, the devices for turning the flaps toward sealed position, the main carrier-belts, the intermediate carrier-belt opposite and extending parallel to the main belt, and the sealing-belt opposite the main carrier-belt in rear of the intermediate belt, the intermediate belt being of less width than the sealing-belt substantially as set forth.

8. In a machine substantially as described the combination of the hopper provided at one side with an adjustable gage-plate and at its opposite side with an infeed belt and at its bottom with a transverse feed-roller, a moistening device at the discharge end of the hopper, flap-turning devices in rear of the moistening device, the main carrier-belt, the intermediate carrier-belt, the sealing-belt, and means for driving the belts, substantially as set forth.

9. In a machine for sealing envelops the combination of the moistening device, means for feeding the envelops to and past the moistening device, sealing devices in rear of the moistening device, a flap-holder arranged between the moistening device and the sealing devices and means at the front end of the flap-holder by which the flap may be turned toward the sealing position, substantially as described.

10. The combination in an envelop-sealing machine of the hopper provided at one side with an adjustable gage-plate and at its opposite side with the infeed-belt, the sponge-holder at the discharge end of the hopper and provided with an opening in one side, the moistening-roller operating at one side in said opening and arranged to receive the flap of the envelop discharged from the hopper, the pressing-roller opposite the moistening-roller, and means for turning and sealing the flap substantially as set forth.

11. In an envelop-sealing machine the combination with devices for feeding and moistening the envelop, of a flap-turner in rear of the moistening devices and a channeled or U-shaped flap-holder in rear of the flap-turner, substantially as set forth.

12. An envelop-sealing machine comprising moistening devices, means for feeding the envelops to the moistening devices with the flap turned up, flap-turning devices in rear of the moistening devices, and opposing belts in rear of the moistening devices and arranged with their runs vertically edgewise, substantially as and for the purposes set forth.

13. In an envelop-sealing machine the combination with means for moistening and turning the flaps, of the opposing carrier-belts, means for driving the belts on one side and devices for adjusting the opposite belt substantially as set forth.

14. In a machine for sealing envelops the combination of the infeed-belt, the intermediate carrier-belt, and the sealing-belt and the rollers of said belts having shafts provided with sprocket-wheels, of the sprocket-chain meshing with the sprocket-wheels whereby to drive said belts, and the main carrier-belt, substantially as set forth.

15. In a machine substantially as described, the combination with the main framing, and the main carrier-belt and its rollers, of the bearing for said rollers slidable in the main frame, the tubular belts threaded in the main frame, the rods passed through said tubular belts and secured at their inner ends to the bearings and provided at their outer ends with nuts, and the springs on said rods between the bearings and the tubular belts, substantially as set forth.

16. The combination in a machine substantially as described of means for feeding the envelops, moistening the flaps and turning said flaps toward sealing position, the sealing-belt, an opposing belt, and rollers supporting said belts, and rollers operating within the belts between their end rollers and arranged to press the envelop successively as it is passed between the belts, substantially as set forth.

17. The combination in the machine substantially as described of the hopper having an infeed-belt, a beam-roller and an adjustable gage-plate opposite the infeed-belt, the moistening-roller in rear of the discharge end of the hopper, flap-turning devices in rear of the moistening-roller, the main carrier-belt, the intermediate carrier-belt, and the sealing-belt, substantially as set forth.

18. A machine for sealing envelops having a feed-hopper arranged to support envelops edgewise and provided with a feed-roller extending at a right angle to the envelops and adapted to operate upon the edges of the envelops to feed the same lengthwise.

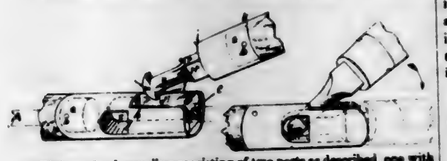
19. The combination in an envelop-sealing machine with belts for feeding and sealing the envelops, of a flap-moistening roller and a pressing roller opposite the moistening-roller, the latter being arranged above the plane of the carrier-belts and to operate upon the upturned flap of the envelop, and means for turning the flap toward sealed position, substantially as set forth.

20. A machine for sealing envelops having a feed-hopper, an infeed-belt at one side thereof and arranged vertically edgewise whereby it may operate upon one face of the envelop and the transverse feed-roller extending across the bottom of the feed-hopper.

21. The combination in an envelop-sealing machine, of a longitudinally-extending flap-holder or trough, and mechanism at the front end of said holder by which to turn the flap toward the sealing position.

22. An envelop-sealing machine having a hopper adapted to feed envelops longitudinally edgewise and provided at one side with a gage-plate extending diagonally to the direction of feed of the machine, and adjustably in the direction of its length whereby its longitudinal movement will operate to adjust the gage-plate laterally, substantially as shown and described.

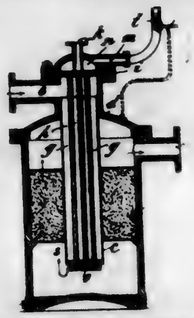
709,762. COUPLING FOR CONDUIT-RODS. JOHN F. GREAVES, St. Louis, Mo. Filed Apr. 7, 1902. Serial No. 101,698. (No model.)



Claim.—1. A coupling consisting of two parts as described, one with rectangular opening in end and along the side as shown, connecting with circular cavity in the part, which cavity is wider than the rectangular opening connecting with it, forming shoulders on each side of the cavity, and the other part, having round part *a* with convex head fastened on sides, as described with projecting points on the two sides adapted to engage the shoulders formed by the cavity at the end of the rectangular opening, in the other part when inserted into the cavity of the other part, through the rectangular opening, substantially as specified.

2. A coupling consisting of two parts as described, one with round part *a* and rectangular part *c* having rectangular faces *p* and *p p* for the purposes specified which fit into the opening in the other part, which opening is in the form of a rectangular box open at the end of the part at *c* and open along the top at *d* and opening at *e* into the closed cavity which cavity is wider than the rectangular box thereby forming shoulders, which engage the projecting points on the two sides of the convex head on round part *a* as described when the rectangular part *c* is brought down into position so that one of the faces *p p* rests on the bottom of the rectangular box and the faces *p* rest against either side of the rectangular box and fit securely into the rectangular box, substantially as described.

709,768. APPARATUS FOR COOLING AND FILTERING COMPRESSED AIR. FRIEDRICH GROSSMANN, Charlottenburg, near Berlin, Germany. Filed June 7, 1902. Serial No. 110,694. (No model.)



Claim.—1. An apparatus for cooling and filtering air comprising a filtering-chamber the filtering layer of which is penetrated by a central pipe, the upper end of the latter fitting tightly into the cover of the filtering-chamber and connected to a supply-pipe, and the lower end of the said central pipe being open, in combination with a system of cooling-pipes arranged within the central pipe and provided at one end with a closed common chamber and connected at the other end respectively with a collecting-chamber and supply-pipe, essentially as and for the purpose set forth.

2. An apparatus for cooling and filtering air comprising a filtering-chamber the filtering layer of which is penetrated by a central pipe, the upper end of the latter fitting tightly into the cover of the filtering-chamber and connected to a supply-pipe, and the lower end of the said central pipe being open, a system of cooling-pipes arranged within the central pipe and provided at one end with a closed common chamber and connected at the other end respectively with a collecting-chamber and supply-pipe, in combination with a supply-cistern and a serpentine pipe from the said cistern to the supply-pipe of the cooling-pipe system essentially as and for the purpose set forth.

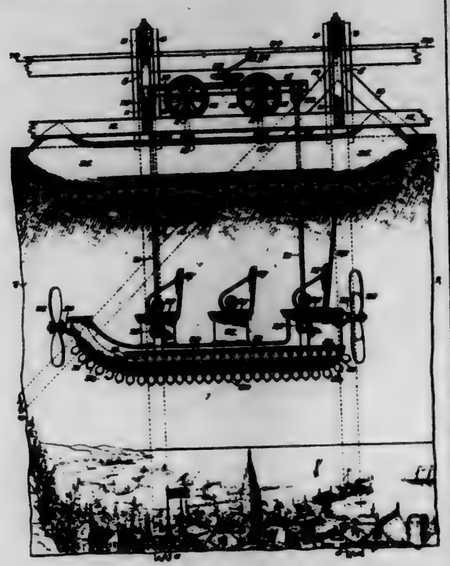
3. An apparatus for cooling and filtering air comprising a filtering-chamber the filtering layer of which is penetrated by a central pipe, the upper end of the latter fitting tightly into the cover of the filtering-chamber and connected to a supply-pipe, and the lower end of the said central pipe being open, a system of cooling-pipes arranged within the central pipe and provided at one end with a closed common chamber and connected at the other end respectively with a collecting-chamber and supply-pipe, in combination with a supply-cistern, a serpentine pipe from the said cistern to the supply-pipe of the cooling-pipe system, and a rising pipe connected to the collecting-chamber of the cooling-pipe system and leading to the said supply-cistern, and a pipe for compressed air supplied to the pipe should give upward motion to the water coming from the cooling-pipes, essentially as and for the purpose set forth.

709,764. ILLUSION APPARATUS. WILLARD L. HALL, Philadelphia, Pa. Filed Mar. 24, 1902. Serial No. 99,727. (No model.)

Claim.—1. The combination in an illusion apparatus of the character described, of a scenic tunnel and an illuminated car arranged to be moved through said tunnel, said car carrying a series of exterior lights having independent circuits, said lights serving to illuminate only that portion of the tunnel directly adjacent to the car, and means for controlling the light-circuits.

2. The combination in an illusion apparatus of the character described, of the scenic tunnel, a track structure mounted therein and an illuminated car arranged to be moved on said track structure, said car carrying a series of exterior lights having independent circuits, said lights serving to

illuminate only that portion of the tunnel adjacent to the car, and means for controlling the light-circuits.



2. The combination in an illusion apparatus of the character described, of the scenic tunnel, a track structure mounted within said tunnel, an illuminated car suspended from said track structure and arranged to be moved through the tunnel, said car having a series of lights having independent circuits, said lights serving to illuminate only that portion of the tunnel adjacent to the moving car, and means for controlling said light-circuits.

4. The combination in an illusion apparatus of the character described, of a continuous scenic tunnel, a car arranged to be moved through said tunnel, means for operating said car, means for illuminating the tunnel within the space occupied by the car as the latter is moved through the tunnel, said means comprising lamps carried by the car on the outside of the same, independent circuits for said lamps, and means for controlling said circuits.

5. The combination in an illusion apparatus of the character described, of the scenic tunnel, a trackway mounted therein, a suitable motor-truck adapted to said trackway, a suspended swinging car carried by said truck, and a balloon-like structure interposed between said swinging car and its supporting-truck.

6. In an illusion apparatus of the character described, the combination of the scenic tunnel, a truck arranged within said tunnel, a motor car or truck mounted on said track, means for traversing said car or truck, a passenger-car suspended from said truck and arranged to have a forward and rearward swinging motion, and a balloon-like structure carried by the supporting-rods for the car and interposed between said car and its supporting-truck.

7. The combination in an illusion apparatus of the character described, of the scenic tunnel, a trackway mounted within said tunnel, a car adapted to traverse the trackway, said car being illuminated and lighting up the tunnel at the portion occupied by the moving car, and a darkened portion through which said car passes, with means for extinguishing the lights carried by the car as it approaches the darkened tunnel and turning the same on automatically after said car leaves the darkened tunnel, substantially as described.

8. The combination in an apparatus of the character described, of the scenic tunnel, a trackway adapted to the same, a suitable supporting structure having suspension-rods for carrying said trackway, a truck mounted on the track, guard-wheels carried by said truck, guard-rails carried by the main track structure to which the guard-wheels are adapted, depending swinging arms carried by said truck, cross-arms supported thereby, depending swinging arms carried by said cross-arms, a passenger-car pivotally hung to said latter swinging arms.

9. The combination in an apparatus of the character described, of the scenic tunnel, a trackway adapted to the same, a suitable supporting structure having suspension-rods for carrying said trackway, a truck mounted on the track, guard-wheels carried by said truck, guard-rails carried by the main track structure to which the guard-wheels are adapted, depending swinging arms carried by said truck, cross-arms supported thereby, depending swinging arms carried by said cross-arms, a passenger-car pivotally hung to said latter swinging arms, and a balloon-like structure interposed between the passenger-car and the supporting-truck and serving to hide the operating mechanism from the passengers in the car, as well as heighten the illusion of riding in a flying-machine.

10. In an illusion apparatus of the character described, a suspended passenger-car arranged to swing forwardly and rearwardly, fans mounted at the front and rear of said car, means for driving said fans, means for suspending said car from a suitable trackway, and means for driving the car, said fans being operated only when the car is in motion.

11. In an illusion apparatus of the character described, a suspended passenger-car arranged to swing, means for suspending said car from a suitable trackway, rotary fans mounted at the front and rear of said car, means for driving said fans, said latter means being only operated when the car is in motion, a series of electric lights carried by said car and having independent circuits, and means for controlling said lamp-circuits.

12. In an illusion apparatus of the character described, the combination of the scenic tunnel, a trackway, a suspended car, a series of lamps carried by said car and having independent circuits, said lamps serving to illuminate the scenic tunnel only at the point adjacent to the car, means for suspending the car from the trackway, means for driving the car and means for controlling the lamp-circuits.

13. In an illusion apparatus of the character described, a suspended car, a series of lamps carried by said car, said lamps being of various colors and having independent circuits, means for suspending said car from a suitable trackway, and means for driving the car.

14. In an illusion apparatus of the character described, a suspended car, a series of lamps carried by said car, said lamps being of various colors and having independent circuits, means for suspending said car from a suitable trackway, means for driving the car and means for controlling the lamp-circuits independently.

15. In an illusion apparatus of the character described, the combination of the scenic tunnel, a car adapted to pass through said tunnel, and a movable lamp structure carried by the tunnel-wall.

16. In an illusion apparatus of the character described, the combination of the scenic tunnel, a car adapted to pass through said tunnel, a movable lamp structure carried by the tunnel-wall, means for moving said lamp across the face of the scenery, and means for controlling the movement of the lamp by the moving car.

17. In an illusion apparatus of the character described, the combination of the scenic tunnel, a car adapted to pass through said tunnel, a movable lamp arranged adjacent to the tunnel-wall, an endless belt or chain carrying said lamp, a connection from the main feed-wire to said lamp, means for operating the chain or belt to move the lamp across the face of the scenery, and means for controlling such movement by the moving car.

18. In an illusion apparatus of the character described, the combination of the continuous scenic tunnel, a continuous endulatory trackway arranged within said tunnel, a car suspended from said trackway and adapted to be swung as it traverses said undulatory trackway, lights carried by said car to illuminate the scenic tunnel as it passes through the same, independent circuits for said lights, and means for controlling said circuits.

19. In an illusion apparatus of the character described, the combination of the continuous scenic tunnel arranged in a serpentine course, a continuous trackway arranged in said tunnel, a car adapted to said trackway, said car being illuminated on its exterior by a series of lights, independent circuits for said lights, and means for controlling said circuits.

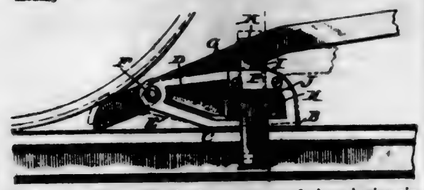
20. In an illusion apparatus of the character described, the combination of the continuous scenic tunnel arranged in a serpentine course, a continuous undulatory trackway arranged in said tunnel, and a swinging car adapted to be moved along said trackway, the swinging movement of the car being imparted by the track, said car being illuminated on its exterior, substantially as and for the purpose set forth.

21. The combination in an illusion apparatus of the character described, of a scenic tunnel, a car arranged to be moved through said tunnel, a series of lights arranged on the under portion of said car, said lights serving to illuminate only that portion of the tunnel directly adjacent to and below the car, independent circuits for said lights, and means for controlling said circuits.

22. The combination in an illusion apparatus of the character described, of a scenic tunnel, a moving structure adapted to be traversed through said tunnel, means for operating the moving structure, a series of lights with independent circuits arranged to illuminate the scenic tunnel within the space occupied by the moving structure as the latter traverses said tunnel, counting means carried by the moving structure and the tunnel structure for controlling said circuits, and a shield or deflector disposed to cut off the light rays from the moving structure and reflect them onto the scenery of the tunnel.

23. The combination in an illusion apparatus of the character described, of a scenic tunnel, a trackway mounted therein, a motor-truck mounted on said trackway, means for operating said truck, a car carried thereby, a series of lights with independent circuits arranged to illuminate the scenic tunnel within the space occupied by the car as the truck traverses said tunnel, counting means carried by the truck and the tunnel structure for controlling said circuits, and a shield or deflector disposed to cut off the light rays from the car and reflect them onto the scenery of the tunnel.

709,765. CAR-MOVER. HARRY C. HARRINGTON and WILLIAM H. TOWERS, Rome, Ga. Filed June 20, 1902. Serial No. 113,117. (No model.)



Claim.—1. The combination in a car-mover, of a lever having pivotal action, a tilting body portion supporting the lever and adapted to rest upon the track-rail, and means at the rear of the body portion adapted to grip the under side of the head of the track-rail upon tilting movement of the body portion substantially as described.

2. The combination in a car-mover employing a lever, of a support for the lever consisting of a substantially U-shaped body portion having its rear under side horizontal and its forward end elevated or inclining downwardly to said horizontal under side, the side walls of said forward end being perforated to receive a pin passing through the lever, and means at the rear end of the body portion, upon pressure being applied by the lever effecting tilting action of the body portion, adapted to grip the track-rail and lock the said body portion against rearward movement substantially as described.

3. The combination with a car-mover employing a lever, means for supporting the lever, and means for locking the lever-supporting means against rearward movement involving jaws adapted in operation to grip the under side of the head of the rail, the lever-supporting means consisting of a body portion having tilting movement upon the track-rail, its forward end having pivotal connection with the lever and its rear end adapted to support the locking means substantially as described.

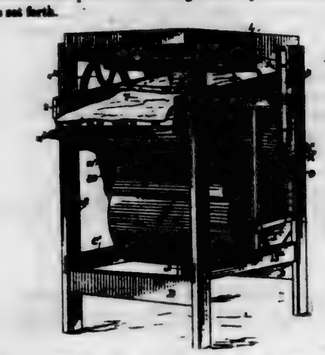
4. The combination in a car-mover employing a lever and a body portion, the latter resting upon the track-rail and adapted to be tilted, said body portion having its forward end inclined upwardly and providing pivotal support for the lever, clamping devices at the rear of the body portion having lateral adjustment and adapted to engage the under side of the head of the rail, means for supporting the clamping devices in spaced position adapted to receive the lever between them whereby they are held against lateral movement and, upon the body portion being tilted, operating to clamp the rail and secure the lever-support against rearward movement substantially as described.

5. The combination with a car-mover employing a lever and tilting means for supporting the lever, the latter consisting of a substantially U-shaped body portion having the lever pivoted to its forward end, inclined and horizontal under surfaces on the body portion, sockets at the rear of and in the side walls of the body portion, clamping devices supported in the said sockets, upon whereby the said clamping devices may be adjusted permitting removal of the body portion, means whereby they are held against lateral movement and means whereby they are drawn upwardly and thereby engaging the rail and locking the lever-support against rearward movement substantially as described.

709,766. SEED-CLEANER AND GRAIN-SEPARATOR. BENJAMIN F. HATFIELD, Dublin, Ind. Filed Nov. 15, 1901. Serial No. 82,362. (No model.)

Claim.—1. In a machine as described, the combination with the hopper, and the separater-shoe, supported on the main frame, and having reciprocal movement thereon; of the chaff-shoe, supported on the main frame for reciprocal movement, and disposed between the separater-shoe and the hopper, said chaff-shoe including a series of separating-screens and a deflector device, a bottom consisting of two members slidable to or from each other, and a trough extended transversely under the shoe, at the lower side of said bottom, and means for imparting reciprocal movement to the two shoes in opposite directions, as set forth.

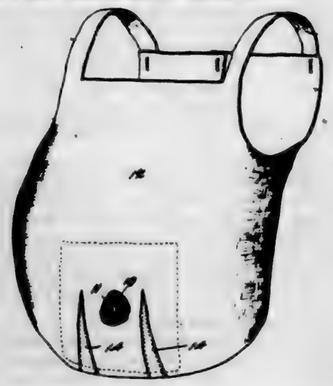
2. In a machine as described, the combination with the separater-shoe, the blast devices including the grain-chute, said chute having an opening at a point opposite its receiving-mouth, and a closure member for said opening; of a grain-box connected to the receiving-mouth of said chute, said box having portions adapted to extend over or straddle the discharge end of the separater-shoe, said grain-chute having a longitudinal, transverse partition dividing it into two compartments; and air-boards extending from the fan-box up into each of said compartments, the board in one compartment extending further up than the board in the other, as set forth.



3. In a machine of the character described, the combination with the chaff-shoe, and the separater-shoe, said shoes being inclined in opposite directions, their contiguous ends being slidably supported on rollers on the main frame; of the vibratory hangers H, having at their upper ends and above their fulcrum-point in the bracket 36, the rigidly-attached angle-brackets A, pivotally connected to the upper end of the chaff-shoe; and at their lower ends below the fulcrum-point provided with the rigidly-secured bracket portions A' having the pivots A^2; the plates 3^2 provided with the notches A^3, secured to the separater-shoe to receive the pins A^2, to adjustably connect the separater-shoe to the lower end of said hangers H; the fan-shaft, and intermediate devices driven thereby for imparting a vibratory motion to the hangers H, all being arranged as specified and shown.

4. The combination with the chaff-shoe 2, the apron 7, the separater-shoe 3, and the fan-shaft, having crank portions, said shoes 2 and 3, having roller-bearings at their contiguous ends, the shoe 2, having internally-projecting studs at its upper end; of the hangers H H, each fulcrumed on the main frame in the bracket 36, at a point between the shoes 2 and 3, their angle-brackets A being pivotally joined to the studs A', at the upper end of the chaff-shoe, said hangers each having a supplemental dependent member A' carrying a stud A^2; a plate 3^2 carried on the shoe 3, and having vertical notches in its lower face, adapted to receive and rest upon the said lateral studs A^2 on the lower end of the arm A'; and the cranks on the fan-shaft, all being arranged substantially as shown and for the purpose described.

709,767. BANDAGE. CLARA J. HIGGINS, Wanatah, Ind. Filed Apr. 8, 1902. Serial No. 102,117. (No model.)



Claim.—1. In a device of the class specified, a perforated pad formed of a number of layers, one of which is of waterproof material, said pad being unconfined and free to move with the body, a secondary layer of fabric, an outer protecting-sheet of waterproof material covering said layer, there being ventilating-openings in both the secondary layer and the protecting-sheet.

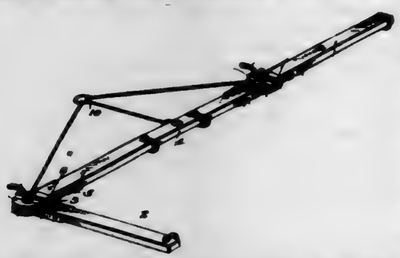
2. In a device of the class specified, a perforated pad formed of an inner and outer layer of soft fabric and an intermediate layer of waterproof material, a secondary sheet of fabric for the reception of an antiseptic, and an outer protecting-sheet of waterproof material, both the secondary layer and the outer sheet being perforated, substantially as specified.

3. In a device of the class specified, a perforated pad, a layer of cloth adapted to receive an antiseptic, an outer protecting-sheet of waterproof material, and an abdominal band entirely disconnected from the bandage, said band having its lower edge reduced in length, and its upper edge provided with shoulder-straps, and means for securing the band in position, substantially as specified.

709,768. FLASK FOR MAKING SEAMLESS SASH-WEIGHTS. ADDISON S. HOUGHS, Everett, Mass. Filed Aug. 16, 1900. Serial No. 27,167. (No model.)

Claim.—In a flask for making seamless sash-weights, the combination of the parallel sides A, A, the metal end bars B, B, connecting said sides, the bottom board L, removably secured to said sides, the core-prints I, extending transversely of the flask between said sides, the adjustable pattern-supports G opposite said core-prints, the supplementary bars N, extending transversely of the flask and in contact with said pattern-supports, and the stop-bars K extending transversely of and adjustably secured to said sides behind said core-prints and supports, as and for the purpose set forth.

709,769. HARROW DRAW-BAR. ALBERT O. HOSPERS, Sandwich, Ill. Filed May 1, 1902. Serial No. 105,474. (No model.)

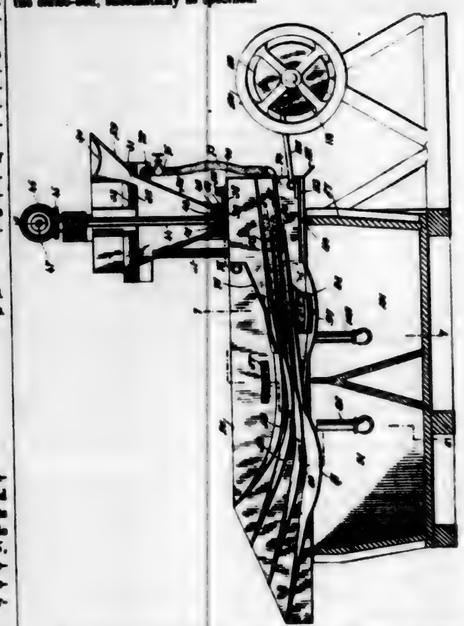


Claim.—A harrow draw-bar having heads at its ends, extensions having heads at their ends, bolts for connecting the heads, one set of heads being provided with ribs and the other set with receiving-grooves to form an interlocking joint, and nuts engaging said bolts for clamping the parts in locked position, substantially as and for the purpose described.

709,770. CONCENTRATOR. JOHN A. HOLMES, Salt Lake City, Utah, and JOHN F. WERN, Denver, Colo. Filed Oct. 2, 1901. Serial No. 77,261. (No model.)

Claim.—1. A concentrator, comprising a sluice-box, a series of pans arranged one above another in the sluice-box, the said pans being longitudinally curved and laterally inclined, the said sluice-box having openings for discharge of gangue at the higher sides of the pans, and openings at the lower sides of the pans for discharge of values, launders arranged one within another and receiving material from the first-named openings and means for imparting a reciprocating motion both laterally and longitudinally to the sluice-box carrying the pans, substantially as specified.

2. An ore-concentrator, comprising a sluice-box, a series of pans arranged one above another in the sluice-box, the said pans being longitudinally curved and arranged to discharge at one side from one pan to another intermediate of the ends, launders at the opposite sides in which material is discharged from the pans, means for imparting a longitudinal reciprocating motion to the sluice-box, and means comprising a shaft and a plurality of levers for imparting a transverse reciprocating motion to the sluice-box, substantially as specified.



3. An ore-concentrator, comprising a sluice-box, a series of pans arranged one above another in said box, the said pans being longitudinally curved and inclined laterally, valve-controlled outlets at the lower sides of the pans, launders for receiving material from said outlets and adapted to discharge into the pans consecutively from the second pan to the lowermost one, the said launders being arranged one within another, and launders at the opposite side for receiving the gangue from the pulp, substantially as specified.

4. An ore-concentrator, comprising a sluice-box mounted to reciprocate, a series of longitudinally-curved pans arranged one above another in vertical alinement in the sluice-box and adapted to discharge material from one pan to another, means for discharging water upon the pans one independently of another, a divided tank on which the box is supported, and amalgamating devices in the tank, substantially as specified.

5. An ore-concentrator, comprising a sluice-box, pans arranged therein one above another, a series of hoppers arranged above the feed end of the sluice-box, a feed-trough common to all the hoppers, a valve for the outlet of each hopper, an agitator carried by each valve, a sieve material at the top of each hopper, and a filter material on the sieve material, substantially as specified.

6. An ore-concentrator, comprising a sluice-box, means for imparting reciprocating longitudinal movement to the sluice-box, a series of longitudinally-curved pans arranged in the box one above another, a series of hoppers arranged above the feed end of the sluice-box and having outlet-ports through the bottoms, valves for regulating said outlet-ports, means for operating said regulating-valves, rotary valves for opening and closing said ports, means for simultaneously operating all of said rotary valves, and agitators carried by said rotary valves, substantially as specified.

7. An ore-concentrator, comprising a sluice-box, means for imparting reciprocating motion to said sluice-box, a series of pans arranged one above another in said box, a series of hoppers arranged above the feed end of the sluice-box, each hopper having a discharge-opening in its bottom, a valve for regulating the opening in said port, rotary valves in the hoppers and having ports adapted to move into register with the ports in the bottoms of the hoppers, shafts extended upward from said rotary valves, a driving-shaft, and gear connections between said driving-shaft and the valve-shafts, substantially as specified.

8. An ore-concentrator, comprising a sluice-box, a series of pans arranged one above another in said box, a series of hoppers placed above the feed end of said sluice-box, means for opening and closing discharge-openings through the bottoms of said hoppers, a filter material arranged in the upper portion of the hoppers, water-boxes for receiving water passing through the filter material, and means for conveying water from box of said boxes to the pans, substantially as specified.

9. An ore-concentrator, comprising a sluice-box, means for imparting a longitudinal reciprocating motion to said box, a series of pans arranged in said box one above another, the said pans being longitudinally curved and inclined laterally, discharge-openings through a side wall of the box at the highest side of the pans, discharge and inlet openings at the opposite side of the box, a reservoir upon which the box moves, receiving-pans carried by the box and adapted to be submerged in the water contained in said reservoir, inclined amalgamated plates for receiving material from said receiving-pans, the said plates being arranged in the reservoir, and mercury-troughs supported below said plates, substantially as specified.

10. An ore-concentrator, comprising a sluice-box, means for imparting a longitudinal reciprocating motion to said box, means for imparting a transverse reciprocating motion to said box, a tank on which the box moves and into which the values finally discharge from the pans, longitudinally-curved pans arranged one above another in the box, means for supplying pulp to the uppermost pan, a water-distributing pan extended over the uppermost pan, and a perforated pipe for discharging water onto said water-pan, substantially as specified.

11. An ore-concentrator, comprising a sluice-box, having both a longitudinal and a transverse motion, a series of longitudinally-curved pans arranged one above another in said box and adapted to discharge material at one side one upon another and to discharge gangue at the opposite side, means for discharging water upon the several pans, a reservoir upon which the sluice-box moves, the said reservoir being divided into two compartments, inclined amalgamated plates arranged in the compartments of the reservoir and adapted to receive values from the pans, overflow-pipes for the compartments, a separator for receiving the overflow, a sieve material in the upper portion of the separator, and a filter on said sieve material, substantially as specified.

12. An ore-concentrator, comprising a sluice-box, means for imparting reciprocating motion to said sluice-box, a series of pans arranged one above another in said box, the said pans being longitudinally curved and inclined transversely, the sluice-box having discharge-openings and inlet-openings at one side, valves for the outlet-openings, means for adjusting the valves, and launders arranged one within another for receiving material from the higher sides of the pans, said material discharging through openings in a side of the box, substantially as specified.

13. An ore-concentrator, comprising a sluice-box, means for imparting motion to said sluice-box, a series of pans arranged one above another in said box, the said pans being longitudinally curved and inclined transversely, launders arranged on the sluice-box one within another and adapted to receive material from the pans at the higher side, and launders at the opposite side of the sluice-box and adapted to receive values from the lower sides of the pans and to discharge material received from one pan to the next lower pan, substantially as specified.

14. In a concentrator, a sluice-box, means for imparting longitudinal reciprocating motion to said sluice-box, means for imparting transverse reciprocating motion to said box, a series of pans arranged one above another in the box, a reservoir on which the sluice-box is mounted to move, said reservoir being divided into two compartments, launders for receiving material discharged from one side of the pans, a pipe for discharging water into said launders, launders at the opposite side for receiving values from the pans, and amalgamated plates arranged in the compartments of the reservoir for receiving values from the lowermost pans, substantially as specified.

15. An ore-concentrator, comprising a sluice-box, means for imparting motion to said sluice-box, a series of pans arranged one above another in said box, a series of feed-hoppers arranged above the feed end of the box, valves in the hopper and carrying agitators, water-receiving troughs for receiving water discharged over the upwardly-extended wall portion of the end hoppers, and means for conveying water from said boxes to the machine, substantially as specified.

16. An ore-concentrator, comprising a sluice-box, a series of pans arranged one above another in said sluice-box, the said pans being longitudinally curved and inclined transversely, means for directing water to the pans, a series of hoppers, a feed-trough common to all the hoppers and having a sieve in its upper portion, means for controlling the discharge of pulp from said hoppers onto the uppermost pan, a filter in each hopper, and a receiver for water passing through said filters, substantially as specified.

17. An ore-concentrator, comprising a reservoir, a sluice-box mounted on the reservoir, means for imparting a longitudinal reciprocating motion to the box, and means for imparting lateral movement to the box, comprising a shaft, a sliding connection between said shaft and the box, a lever connection between the lower portion of the shaft and the box, an arm extended from the lower portion of the shaft and having pivotal connection with a fixed support, and a slotted arm above the first-named arm, substantially as specified.

709,771. CLUTCH. PAUL A. HOUGHTALING, Riverton, N. J. Filed June 3, 1902. Serial No. 110,059. (No model.)

Claim.—1. In a clutch, the combination with a driving and a driven member of a device including a toothed wheel, pawls constructed to be engaged therewith and disengaged therefrom, a carrier for the pawls supported by a portion of the toothed wheel, pins for operating said pawls and transmitting the power from the driving to the driven member, and cams for actuating said pins and causing them to engage or to disengage from the toothed wheel, substantially as described.

2. In a clutch, the combination of two members, one of the same including a casing having ratchet-teeth and a bearing-surface formed integral with said casing, a device provided with pawls carried on said bearing-surface, pins for transmitting power from one of the members of the clutch to the other and also serving to operate said pawls, with means for causing the pawls to engage or disengage from the ratchet-teeth, substantially as described.

3. The combination in a clutch, of two members, one of the same including a structure having two substantially cylindrical surfaces extending parallel to each other, ratchet teeth on one of the surfaces and a pawl-carrier supported on the other, pawls on the carrier, with means on the second member for causing the pawls to engage with or disengage from said ratchet-teeth when the relative speed of the members is varied, substantially as described.

4. The combination in a clutch of two members, one including an internally-toothed casing having a bearing portion, a pawl-carrier supported on said bearing portion, pawls pivoted to said carrier and placed to engage with the teeth of the casing, the second member including a shaft and a structure fixed thereto, said structure and the pawls comprising two parts of which one has cam-slots and the other has pins projecting into said slots whereby the pawls are caused to engage with or disengage from the said teeth under certain conditions of speed variation of the two members, substantially as described.

5. In a clutch, the combination of a toothed ratchet-wheel, a carrier, a pawl or pawls supported thereby, means for operating the pawls, the same including projecting portions for directly transmitting power from one member of the clutch to the other and means other than the portion of the carrier for the support of the pawl, whereby the pawl or pawls are retained in operative position within the clutch, substantially as described.

6. In a clutch, the combination of a toothed ratchet-wheel, a carrier, a pawl or pawls supported thereby, means for operating the pawls, the same including projecting portions for directly transmitting power from one member of the clutch to the other, and an arm on the carrier other than the portion thereof for supporting the pawl, said arm retaining the pawl or pawls in operative position within the clutch, substantially as described.

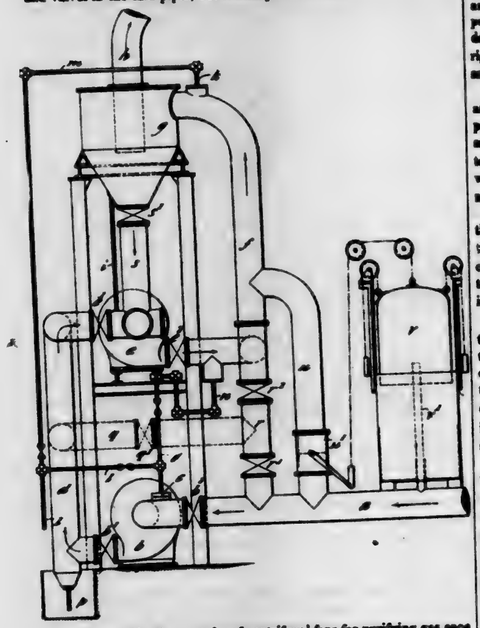
7. In a clutch, the combination of a toothed ratchet-wheel, a pawl or pawls lying in approximately the plane of the teeth of said wheel, a carrier for said pawls lying in a plane outside of but parallel to the said plane of pawls and ratchet-teeth, with means for operating the pawls, the same including projecting portions and a device for operating the same whereby said portions are made to directly transmit power between the members of the clutch, substantially as described.

709,772. APPARATUS FOR PURIFYING GAS. HERBERT A. HUMPHREY, Westminster, London, England. Filed May 5, 1902. Serial No. 106,088. (No model.)

Claim.—1. In apparatus for purifying gases the combination of a series of centrifugal apparatus each delivering into the next succeeding it, pipes connecting the delivery and suction sides of the said centrifugal apparatus and valves in the said pipes, substantially as described.

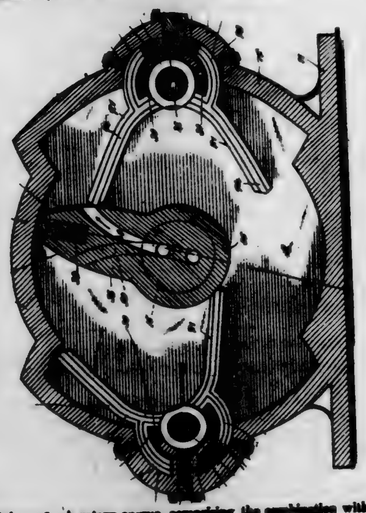
2. In combination, a series of centrifugal apparatus for purifying gas each delivering into the next succeeding it, pipes connecting the delivery and suction sides of the said apparatus, valves in the said pipes and pipes connecting the drainage-sump of each apparatus with the intake of the apparatus next preceding it, substantially as described.

3. In combination, a series of centrifugal fans for purifying gas each delivering into the next succeeding it, a cyclone into which the last delivers, pipes connecting the delivery and suction sides of the said fans, and valves in the said pipes, substantially as described.



4. In combination, a series of centrifugal fans for purifying gas each delivering into the next succeeding it, a cyclone into which the last delivers, pipes connecting the delivery and suction sides of the said fans, valves in the said pipes, and pipes connecting the drainage-vamp of each fan with the intake of the fan next preceding it, substantially as described.

709,778. ROTARY ENGINE. OLIVER C. JONES, Philadelphia, Pa. Filed Mar. 8, 1902. Serial No. 97,261. (No model.)



Claim.—1. A rotary engine, comprising the combination with the cylinder and piston, of an abutment mounted in the cylinder and a tailpiece attached to the abutment and moving therewith, the tailpiece lying in a chamber in the cylinder, means for supplying steam-pressure to said chamber, and a packing device carried in the walls of the cylinder and acting against the tailpiece, to keep the chamber steam-tight.

2. A rotary engine, comprising the combination with the cylinder and piston, the former having a chamber therein, of means leading steam-pressure to said chamber, and an abutment mounted to rock in the cylinder, said abutment being directly opposite the chamber and having a rigid and curved part projecting from its pivoted end and extending into said chamber, for the purpose specified.

3. A rotary engine, comprising the combination with the cylinder and piston, the former having a chamber therein, of means leading steam-pressure to said chamber, an abutment mounted to move in the cylinder, said abutment being directly opposite the chamber and having a part extended therefrom, for the purpose specified, and a packing carried in the walls of the cylinder and bearing against said extended part of the abutment.

4. In a rotary engine, the combination with the cylinder and piston, the former having a chamber therein, of an abutment mounted to swing, the pivoted end of the abutment being adjacent to and opposite to said chamber, a tailpiece rigidly secured to the abutment and curved around the center of the swinging movement thereof, said tailpiece projecting into the chamber, and means for supplying steam pressure to the chamber.

5. In a rotary engine, the combination with the cylinder and piston, the former having a chamber therein, of an abutment mounted to swing, the pivoted end of the abutment being adjacent to and opposite to said chamber, a tailpiece carried by the abutment and curved around the center of the swinging movement thereof, said tailpiece projecting into the chamber, means for supplying steam-pressure to the chamber, and a packing carried in the walls of the cylinder and bearing against the convex side of the tailpiece.

6. In a rotary engine, the combination with the cylinder and piston, the former having a boxing therein and a chamber in the boxing, of a rockable shaft mounted transversely in the boxing, an abutment carried thereby opposite the chamber, a tailpiece attached to the abutment and projecting into the chamber, means for supplying steam-pressure to the steam-chamber, and packing devices bearing respectively against the shaft and against the outer side of the tailpiece to keep the said chamber steam-tight.

7. In a rotary engine, the combination with the cylinder and piston, the former having a chamber therein, of an abutment mounted to swing in the cylinder and lying opposite the open end of the chamber, a curved tailpiece rigidly secured to the pivoted end of the abutment and projecting into the chamber to form a moving wall thereof, and means for supplying steam-pressure to said chamber.

8. In a rotary engine, the combination with the cylinder and piston, of an abutment arranged to swing therein, and steam feed and exhaust devices, the piston having a by-pass groove arranged to permit the passage of the steam past the abutment during the time that the end of the abutment lies over said groove, for the purpose specified.

9. A rotary engine, comprising the combination with the piston and cylinder, of a rockable shaft mounted therein, an abutment carried on the shaft, a packing working against the shaft, the packing comprising two strip-sections, a spring pressing said sections longitudinally from each other, and additional springs pressing the strip-sections sidewise against the shaft.

10. In a rotary engine, the combination with the cylinder and piston, the former having a boxing therein with an interior chamber opening into the cylinder, of an abutment mounted to rock at the mouth of the chamber, a tailpiece rigidly secured to the pivoted end of the abutment and projecting against the side walls of the chamber to keep the chamber closed irrespective of the movements of the abutment, and means for supplying steam-pressure to the chamber.

11. In a rotary engine, the combination with the cylinder and piston, the former having a boxing therein with an interior chamber opening into the cylinder, of an abutment mounted to rock at the mouth of the chamber, a tailpiece rigidly secured to the abutment and projecting against the side walls of the chamber to keep the chamber closed irrespective of the movements of the abutment, and means for supplying steam-pressure to the chamber, the said tailpiece being curved around the center of the swinging movement of the abutment and the adjacent walls of the chamber being correspondingly shaped.

12. In a rotary engine, the combination with the cylinder and piston, the former having a boxing therein with an interior chamber opening into the cylinder, of an abutment mounted to rock at the mouth of the chamber, a tailpiece carried by the abutment and projecting against the side walls of the chamber to keep the chamber closed irrespective of the movements of the abutment, means for supplying steam-pressure to the chamber, the said tailpiece being curved around the center of the swinging movement of the abutment and the adjacent walls of the chamber being correspondingly shaped, and a packing device carried by the cylinder and working against the convex or outer walls of the tailpiece.

13. In a rotary engine, the combination with the cylinder and piston, the former having a boxing therein with an interior chamber opening into the cylinder, of an abutment mounted to rock at the mouth of the chamber, a tailpiece carried by the abutment and projecting against the side walls of the chamber to keep the chamber closed irrespective of the movements of the abutment, means for supplying steam-pressure to the chamber, a rocking shaft mounted in the cylinder and carrying the abutment, and packing devices working with the shaft and with the tailpiece to keep the said chamber steam-tight.

14. In a rotary engine, the combination of a cylinder, a piston arranged to turn therein, and an abutment mounted to swing in the cylinder, for the purpose specified, the said piston having a port leading through the side thereof and a by-pass groove in said side at the outer end thereof, said groove permitting the steam to pass the abutment when the abutment lies over the groove.

15. A rotary engine, comprising a cylinder, a piston arranged to turn therein and having a by-pass groove, an abutment working with the piston, and means for applying steam-pressure continuously to the abutment to return it to normal position, the by-pass groove permitting the passage of steam past the abutment as it lies over the groove, whereby to accelerate the return movement of the abutment.

16. A rotary engine, comprising the combination of a cylinder having a boxing with two chambers therein, a rocking trunnion-shaft mounted in the boxing between the chambers, two abutments carried to rock with the shaft and lying opposite the chambers, tailpieces carried respectively by the abutments and projecting into the chambers for the purpose specified, and means for supplying steam-pressure to either one of said chambers, and a piston working in the cylinder and coacting with the abutments.

17. A rotary engine, comprising the combination of a cylinder having a boxing with two chambers therein, a rocking trunnion-shaft mounted in the boxing between the chambers, two abutments carried to rock with the shaft and lying opposite the chambers, tailpieces carried respectively by the abutments and projecting into the chambers, for the purpose specified, means for supplying steam-pressure to either one of said chambers, a piston working in the cylinder and coacting with the abutments, packing devices lying against the trunnion-shaft to keep the said chambers steam-tight from each other, and additional packing devices lying against the tailpieces to keep the respective chambers steam-tight.

18. In a rotary engine, the combination with the cylinder having an offset therein divided by a horizontally-located boxing, said boxing having two chambers formed therein and opening into the cylinder, of a rocking trunnion-shaft mounted in the boxing intermediately said chambers, abutments carried on the trunnion-shaft and movable therewith to swing into the respective offsets of the cylinder, tailpieces carried respectively by the abutments and projecting into the chambers, for the purpose specified, means for supplying steam-pressure to either one of the chambers as desired, and a piston working in the cylinder and coacting with the abutments.

19. In a rotary engine, the combination with the cylinder having an offset therein divided by a horizontally-located boxing, said boxing having two chambers formed therein and opening into the cylinder, of a rocking trunnion-shaft mounted in the boxing intermediately said chambers, abutments carried on the trunnion-shaft and movable therewith to swing into the respective offsets of the cylinder, tailpieces carried respectively by the abutments and projecting into the chambers, for the purpose specified, means for supplying steam-pressure to either one of the chambers as desired, a piston working in the cylinder and coacting with the abutments, a packing-strip carried transversely at the end of the piston, and a spring pressing said packing-strip outward, whereby to effect steam-tight connection with the cylinder and abutments.

20. In a rotary engine, the combination of a cylinder, an abutment mounted to swing therein, a shaft mounted to turn in the cylinder, and a piston carried by the shaft within the cylinder and coacting with the abutment, said shaft having longitudinal passages formed therein and the steam-passages turning laterally into the piston and opening at opposite sides thereof, the said abutment being in two parts standing at an angle to each other and mounted at the middle to work in the manner specified.

21. In a rotary engine, the combination of a cylinder, an abutment mounted to swing therein, a shaft mounted to turn in the cylinder, a piston carried by the shaft within the cylinder and coacting with the abutment, said shaft having longitudinal passages formed therein and the steam-passages turning laterally into the piston and opening at opposite sides thereof, and cut-off devices working over the shaft to command the steam-passages.

22. In a rotary engine, the combination of a cylinder, an abutment mounted to swing therein, a shaft mounted to turn in the cylinder, a piston carried by the shaft within the cylinder and coacting with the abutment, said shaft having longitudinal passages formed therein and the steam-passages turning laterally into the piston and opening at opposite sides thereof, and cut-off devices working over the shaft to command the steam-passages, said cut-off devices comprising shoes loosely engaged with the shaft to open and close the steam-passages as the shaft turns.

23. A rotary engine having steam-passages formed in the piston-shaft, and radially-movable cut-off shoes loosely engaged with the shaft to open and close the steam-passages as the shaft turns.

24. A rotary engine having steam-passages formed in the piston-shaft, cut-off shoes loosely engaged with the shaft to open and close the steam-passages as the shaft turns, and means for mounting the cut-off shoes to allow their independent engagement with and disengagement from the shaft.

25. A rotary engine having steam-passages formed in the piston-shaft, cut-off shoes loosely engaged with the shaft to open and close the steam-passages as the shaft turns, and means for mounting the cut-off shoes to allow their independent engagement with and disengagement from the shaft, said means comprising hand-cams attached to the shanks of the shoes and working with a relatively stationary support.

26. In a rotary engine, the combination of the engine-shaft having a steam-passage therein, a gland in which the shaft turns, a chamber-ring located around the shaft and within the gland and communicating with the steam-feed and with the steam-passage in the shaft, and a radially-movable cut-off shoe located in the chamber-ring and engaged with the shaft in the manner specified.

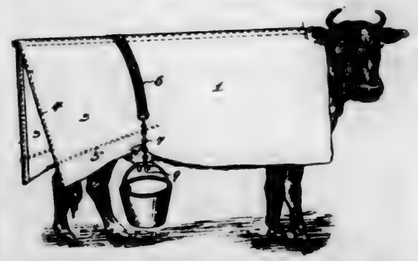
27. In a rotary engine, the combination of the engine-shaft having a steam-passage therein, a gland in which the shaft turns, a chamber-ring located around the shaft and within the gland and communicating with the steam-feed and with the steam-passage in the shaft, a cut-off shoe located in the chamber-ring and engaged with the shaft in the manner specified, and means for removably holding the cut-off shoe in engagement with the shaft.

28. In a rotary engine, the combination of the engine-shaft having a steam-passage therein, a gland in which the shaft turns, a chamber-ring located around the shaft and within the gland and communicating with the steam-feed and with the steam-passage in the shaft, a cut-off shoe located in the chamber-ring and engaged with the shaft in the manner specified, and means for removably holding the cut-off shoe in engagement with the shaft, said means comprising a hand-cam connected with the shank of the cut-off shoe and working against the outer face of the gland.

29. In a rotary engine, the combination of the engine-shaft having a steam-passage therein, a gland in which the shaft turns, a chamber-ring located around the shaft and within the gland and communicating with the steam-feed and with the steam-passage in the shaft, and a cut-off shoe located in the chamber-ring and engaged with the shaft in the manner specified, the chamber-ring being H-shaped in cross-section and having its web perforated to permit the passage of steam.

30. A rotary engine having a cylinder provided with chambers, abutments at the mouths of the chambers and each provided with a curved tailpiece rigid therewith and extending into the chambers, a piston, a piston-shaft having two steam-passages, steam-pipes communicating with the said passages, and branch pipes leading from the steam-pipes to the said chambers.

709,774. MILKING-SHIELD. HENRY H. KABBY, Ashland, Ohio. Filed Apr. 21, 1902. Serial No. 103,998. (No model.)

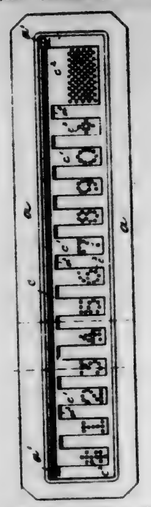


Claim.—1. A bar adapted to lie on the back and extend in rear of an animal, a flexible cover, doubled over the bar, and also extending in rear of the animal, thereby forming rearwardly-extended flaps, the latter being stiffened, for the purpose set forth, and a girth passed around the cover and the body of the animal, substantially as described.

2. A milking-shield comprising a flexible cover adapted to lie on and extend in rear of the animal, means to support the rearwardly-extended portion of said cover and means to stiffen the rearwardly-extended portion of said shield or cover, substantially as described.

5. A [illegible] the hook of and extend [illegible] over said bar and adapted to [illegible] formed by the rearwardly-extended [illegible] substantially as described.

709,775. CHECK-PERFORATOR. MAXWELL KRAUS, New York, N. Y., assignor to Eugene B. Hendrix, Newark, N. J. Filed Apr. 24, 1902. Serial No. 104,435. (No model.)



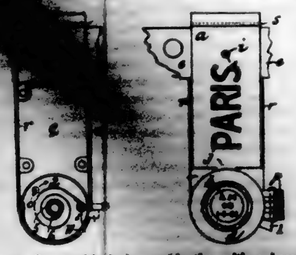
Claim.—1. In a check-perforator, the combination of a base-plate having spaced abutments and intermediate teeth, with a hinged lid having a series of perforated fingers which are adapted to fold flush upon the base-plate intermediate the abutments, the latter being in advance of the hinge of the lid, substantially as specified.

2. A check-perforator comprising the base having spaced abutments and the lid hinged to the base in rear of said abutments and having fingers operating between said abutments and its body portion arranged to be stopped by said abutments in using the device said abutments being adapted to form stops for both the check and the lid substantially as and for the purposes set forth.

709,776. DRAFTING-RULE. MARY C. KELLEY, Wilmington, Del. Filed Jan. 4, 1902. Serial No. 88,630. (No model.)

Claim.—A device of the kind described, comprising a body portion and a curved arm, the end of said arm being bifurcated, one edge of the body portion being a straight edge, the other edge being a constantly-varying curve, one edge of the curved arm containing a long arc of a circle, the other edge of the curved portion containing a short arc of a circle, said short arc intersecting the straight edge of the body portion, substantially as described.

SEAL-LOCK. JULIUS P. KERBAUM, South Yarra, Victoria. Filed Jan. 6, 1902. Serial No. 88,633. (No model.)



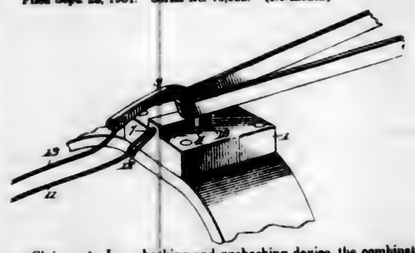
Claim.—1. In a seal-lock, in combination with a base-plate supporting a movable plate having a cutter, a seal-box adapted to be secured on said base-plate and slotted to permit said cutter to protrude into the seal-box, whereby a seal may be placed in said seal-box and be impaled on said cutter, a lid for said seal-box having means for engaging said seal to hold it stationary, locking means for holding said lid closed and means carried by said movable plate for disengaging said locking means.

2. In a seal-lock, in combination with a base-plate, a rotary, spring-controlled disk mounted thereon having a cutter, a seal-box adapted to be secured on said base-plate and slotted to permit said cutter to protrude into the seal-box, whereby a seal may be placed in said seal-box and be impaled on said cutter, a lid for said seal-box having a tongue adapted to puncture said seal and hold it stationary, a locking device engaging said tongue, and means carried by said disk for engaging the locking device and unlocking said lid when said disk is rotated.

3. In a seal-lock, in combination with a seal-box having a movable cutter working therein, a label having a head adapted to be inserted in said seal-box and provided with a slot to receive, and permit unobstructed movement of said cutter, whereby a seal may be placed in said seal-box over said head and be impaled on said cutter.

4. In a seal-lock, in combination with a seal-box having a movable cutter working therein and provided with a lid having a tongue adapted to puncture a seal placed in said seal-box, a reversible label having a head adapted to be inserted in said seal-box and provided with a slot to receive, and permit unobstructed movement of, said cutter and on opposite sides with apertures through one or the other of which said tongue may pass.

709,778. CHECKREIN-HOOK. JOHN P. KETTERINGHAM, Pineridge, Miss., assignor of one-half to Olivia D. Ireland, Pineridge, Miss. Filed Sept. 28, 1901. Serial No. 76,935. (No model.)



Claim.—1. In a checking and unchecking device, the combination with a laterally-swinging spring-actuated rotatable hook, a spindle on which said hook is mounted and formed with oppositely-disposed recesses, spring-actuated means for alternately engaging the recesses in the spindle to lock the hook in its determined position, and means for releasing the same.

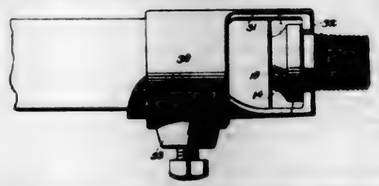
2. In a checking and unchecking device, the combination with a casing provided with a projection near the center thereof, a spring-actuated rotatable hook carried by the casing, means for locking said hook in its normal position to hold the checkrein, means for releasing the hook, and means carried by the hook to engage the projection on the casing whereby the rotation of the hook will be limited.

3. In a checking and unchecking device, the combination with a casing adapted to be secured to the harness-saddle, of a spindle carried thereby, a spring within the casing and connected to the spindle for rotating the same, a hook carried by the spindle, diametrically oppositely located recesses in the spindle, a flexible connection secured to the hook, a spring-actuated pawl adapted to engage the recesses, and a connection for actuating the pawl.

4. In a checking and unchecking device, the combination with a casing, a spring-actuated rotatable hook carried thereby and adapted to swing in a lateral plane, means for locking the said hook to hold the checkrein, means for releasing the checkrein, and means for holding the hook rigid with relation to the casing and in a locked position when the checkrein is released.

5. In a checking and unchecking device, the combination with a casing, a spring-actuated rotatable spindle mounted therein and provided with oppositely-disposed recesses, a hook carried at one end of the spindle and adapted to swing in a lateral plane, a spring-pressed pawl for engaging the recesses to lock the hook, a pin arranged on the casing and adjacent the spindle and a laterally-projecting pin on the spindle adapted to abut against the first-named pin to limit the movement of said spindle.

709,779. PIPE-COUPLING. ARDEIS H. KIRD and WALLACE A. GIBBONS, Joplin, Mo.; said Kird assignor to said Gibbons. Filed Dec. 17, 1901. Serial No. 86,278. (No model.)



Claim.—1. A clamp for hose-coupling comprising an encircling band provided with an arm having an interned flange, an inner clamp member provided with an arm having an interned flange, and means to force the inner member against the hose to be clamped.

2. A clamp for hose-couplings comprising an encircling band provided with an arm having an interned flange, an inner clamp member provided with an arm having an interned flange, and means carried by the encircling band to force the inner member against the hose to be clamped.

3. A clamp for a hose-coupling comprising an encircling band provided with an arm having an interned flange, a shoulder on said band having an internally-screw-threaded aperture therein, an inner clamp member provided with an arm having an interned flange, and a clamping-screw adapted to extend through said aperture and engage said inner member thereby compressing it firmly against the hose to be clamped.

709,780. POWER-HAMMER. CHARLES H. KENNEDY, Mound-ridge, Kans. Filed May 6, 1902. Serial No. 106,135. (No model.)

Claim.—1. A power-hammer comprising an operating-lever for the hammer, a carrier mounted to swing, means for imparting motion to said carrier, and a flexible connection adjustable on the carrier and attached to said operating-lever, to raise or lower the same relative to the said carrier, as set forth.

2. A power-hammer comprising an operating-lever for the hammer, a carrier mounted to swing, means for imparting a positive stroke to said carrier, a flexible connection adjustable on the carrier and attached to the said operating-lever, to move the same on the carrier, and manually-controlled means for adjusting said flexible connection on said carrier, as set forth.

3. A power-hammer comprising an operating-lever for the hammer, a carrier mounted to swing, means for imparting a positive stroke to said carrier, a flexible connection extending over pulleys on said carrier and rigidly attached to said operating-lever, drums on which wind, in opposite directions, the ends of said flexible connection, and means under the control of the operator for turning said drums, as set forth.

4. A power-hammer comprising an operating-lever for the hammer, a carrier mounted to swing, means for imparting a positive stroke to said carrier, a flexible connection extending over pulleys on said carrier and rigidly attached to said operating-lever, drums on which wind, in opposite directions, the ends of said flexible connection, and means under the control of the operator for turning said drums, said drums being held adjustably on their shaft and the latter forming the fulcrum for said carrier, as set forth.

5. A power-hammer, comprising a carrier mounted to swing, means for imparting a positive swinging motion to said carrier, an operating-lever fulcrumed on the carrier and connected with the hammer, and means secured to said operating-lever and adjustable on the said carrier to raise or lower the lever on the carrier, and thereby move the hammer to or from the anvil, as set forth.

6. A power-hammer comprising a carrier mounted to swing, means for imparting a positive swinging motion to said carrier, an operating-lever fulcrumed on the carrier and connected with the hammer, means held adjustably on the carrier and secured to said operating-lever, said means comprising a rope extending over pulleys on the carrier, drums on which the ends of the rope wind in opposite directions, the shaft of the drums forming the fulcrum for said carrier, and a handle on said shaft and under the control of the operator for turning said drums, as set forth.

7. A power-hammer, comprising a hammer proper having a shank mounted to slide vertically, a spring-pressed sleeve held to slide loosely on the hammer-shank, a reciprocating rod pivotally connected at one end with the hammer-sleeve and carrying a spring-pressed sleeve at its other end, an operating-lever pivotally connected at its free end with the said sleeve, a carrier mounted to swing and on which the said operating-lever is fulcrumed, means for imparting a swinging motion to the carrier, and means held adjustable on the carrier and secured to said operating-lever, as set forth.

8. A power-hammer, comprising an operating-lever connected with the hammer, a carrier mounted to swing and carrying the said lever, means for imparting motion to said carrier, and means for adjusting the said lever on the said carrier to vary the distance of the hammer from the anvil, as set forth.

9. A power-hammer, comprising an operating-lever connected with the hammer, a carrier mounted to swing and carrying the said operating-lever, means for imparting motion to said carrier, means for moving the said lever on the carrier to adjust the hammer toward or from the anvil, and a fastening device for said means, as set forth.

10. A power-hammer, comprising an operating-lever for the hammer, a carrier mounted to swing, means for imparting motion to said carrier, and a rope or chain attached to said operating-lever and adjustable on the carrier, as set forth.

11. A power-hammer, comprising an operating-lever for the hammer, a carrier mounted to swing, means for imparting a positive stroke to the carrier, a flexible connection adjustable on the carrier, means connected with the ends of the said flexible connection for adjusting the same; the said connection being attached between its ends to the said operating-lever, as set forth.

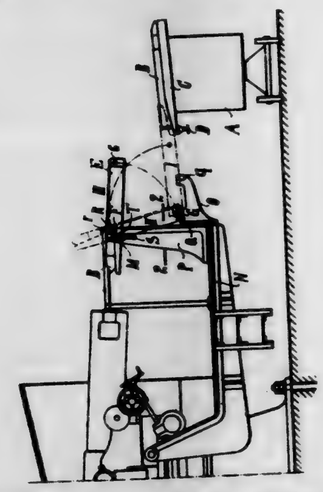
12. A power-hammer, comprising a shaft mounted to turn, an eccentric on said shaft, a carrier mounted to swing and pivotally connected with the eccentric-rod, an operating-lever fulcrumed on the carrier and connected with the hammer, a rope extending over pulleys on the carrier, and connected with the operating-lever, drums on which the ends of the rope wind in opposite directions, and means under the control of the operator for turning said drums.

13. A power-hammer, comprising a carrier mounted to swing, means for imparting a swinging motion to the carrier, an operating-lever fulcrumed at one end on the carrier, a rod connecting the other end of said lever with the hammer, a flexible connection secured to the operating-

lever and adjustable on the carrier, and means connected with the ends of said flexible connection for moving the same in opposite directions as set forth.

14. A power-hammer, comprising a shaft mounted to turn, a carrier mounted to swing loosely on the shaft, means for imparting a positive stroke to the carrier, an operating-lever for the hammer, the said lever being fulcrumed on the carrier, drums adjustable on the shaft, means for fastening the drums in position on the shaft, and a flexible connection adjustable on the carrier, the said connection being attached to the operating-lever and connected at its ends with the said drums, as set forth.

709,781. **APPARATUS FOR TRANSFERRING AMMUNITION FROM THE AMMUNITION-CARRIAGE INTO THE LOADING AXIS OF THE GUN.** JOHANNES KRONE, Essen, Germany, assignor to Fried. Krupp, Essen, Germany. Filed Apr. 23, 1902. Serial No. 104,188. (No model.)



Claim.—1. An apparatus for transferring ammunition from a lower level into the loading-axis of the gun, comprising a loading-tray and a series of supports at progressively-increasing elevations constructed to receive the ends of said tray, whereby it may be tilted end over end from the lower level into successive elevations until it reaches the loading-axis of the gun.

2. An apparatus for transferring ammunition from a lower level into the loading-axis of the gun, comprising a loading-tray, having hand-grips projecting from its opposite ends, and a series of supports at progressively-increasing elevations constructed to receive the ends of said tray, whereby it may be tilted end over end from the lower level into successive elevations until it reaches the loading-axis of the gun.

3. An apparatus for transferring ammunition from the ammunition-carriage into the loading-axis of the gun, comprising a series of bearings suitably supported at progressively-increasing elevations, and a loading-tray having at or near its opposite ends trunnions entering the bearings as the loading-tray is tipped end over end from the lower position to the higher.

4. An apparatus for transferring ammunition from the ammunition-carriage into the loading-axis of the gun, comprising a series of bearings suitably supported at progressively-increasing elevations, and a loading-tray having at or near its opposite ends trunnions entering the bearings as the loading-tray is tipped end over end from the lower position to the higher, and hand-grips projecting from said trunnions.

5. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a support provided with a plurality of bearings at different heights, opening to one side, and the loading-tray having two pairs of trunnions at or near its opposite ends adapted to engage successively in said bearings as the loading-tray is tilted end over end.

6. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a support provided with a plurality of bearings at different heights, opening to one side, and the loading-tray having two pairs of trunnions at or near its opposite ends adapted to engage successively in said bearings as the loading-tray is tilted end over end, and a catch holding the trunnions in one pair of bearings while the other end of the tray is being swung.

7. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a support provided with a plurality of bearings at different heights, opening to one side, and the loading-tray having two pairs of trunnions at or near its opposite ends, adapted to engage successively in said bearings as the loading-tray is tilted end over end, and a catch holding the trunnions in one pair of bearings while the other end of the tray is being swung, said catch being carried by one trunnion and engaging a groove formed in the body of the corresponding bearing.

8. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a support provided with a plurality of bearings at different heights, opening to one side and the loading-tray having two pairs of trunnions at or near its opposite ends adapted to engage successively in said bearings, as the loading-tray is tilted end over end, hand-grips projecting from said trunnions, the catch on one of said hand-grips and trunnions, and a recess on the bearing in which said catch engages, as the trunnion enters its bearing, to hold one pair of trunnions while the tray is being lifted by the other pair.

9. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a support provided with a plurality of bearings at different heights, opening to one side, and the loading-tray having two pairs of trunnions at or near its opposite ends, adapted to engage successively in said bearings as the loading-tray is tilted end over end, and a catch holding the trunnions in one pair of bearings while the other end of the tray is being swung, said catch being carried by one trunnion and engaging a groove formed in the body of the corresponding bearing, and the groove being concentric with the bearing so that the tray can swing while the catch is in engagement.

10. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a tray having trunnions, and studs adjacent to said trunnions, a support having bearings receiving said trunnions to permit the tray to swing thereon, and arresting-bearings receiving said studs to sustain the tray in horizontal position.

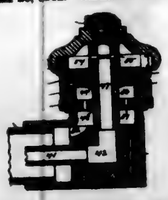
11. An apparatus for transferring ammunition from the ammunition-carriage to the loading-axis of the gun, comprising a tray having trunnions, and studs adjacent to said trunnions, a support having bearings receiving said trunnions to permit the tray to swing thereon, and arresting-bearings receiving said studs to sustain the tray in horizontal position, and provided with a releasable catch to retain the studs in their bearings.

12. An apparatus for transferring ammunition to the loading-axis of the gun, comprising a tray with trunnions, and a support upon which said tray is tilted end over end, constructed with a horizontal bracket holding the tray in receiving position and a vertical standard containing trunnion-bearings upon which the tray is tilted.

13. An apparatus for transferring ammunition to the loading-axis of the gun, comprising a tray with trunnions, and a support upon which said tray is tilted end over end, constructed with a horizontal bracket holding the tray in receiving position and a vertical standard containing trunnion-bearings at its upper end, which receives the trunnions of the tray when the tray is tilted upward and upon which the tray is tilted.

14. An apparatus for transferring ammunition to the loading-axis of the gun, comprising a tray with trunnions, at or near its respective ends, and a support constructed with lower bearings that receive the trunnions at one end of the tray and with a rearwardly-projecting bracket that supports the tray in receiving position, and bearings on the upper portion of the support that receive the other pair of trunnions.

709,782. **HYDROCARBON-BURNER.** LOUIS K. LEARY, Los Angeles, Cal. Filed Jan. 20, 1902. Serial No. 90,371. (No model.)



Claim.—1. In a hydrocarbon-burner two valves having valve-stoppers in shape the frustum of a cone, adjustably connected together at their smaller ends, and adapted to be locked together whereby both valve-stoppers rotate as one, one of said valve-stoppers being provided with a lever and being adapted to control the flow of oil to the burner-tip and the other valve-stopper being adapted to control the flow of steam to the burner-tip.

2. In a hydrocarbon-burner, a burner-tip therefor comprising a casing having a central opening therethrough and a second opening at one side of the central opening; a plug having two flanges, the lower one of which screws into the top of the tip-casing; the upper flange projecting beyond the top of the casing-tip; a central opening extending longitudinally to near the top of the plug and having a plurality of ports extending through the plug above the top flange, as shown; ports in the lower flange connecting the space between the flanges with the side passage in the casing of the tip; a cap affixed to the top of the plug projecting below and beyond the top flange thereof, all constructed as shown and described.

3. A burner-tip for a hydrocarbon-burner, adapted to use steam and oil, comprising a casing having a central and a side passage therethrough; a plug attached to said casing having two flanges, the upper one of which projects beyond the lower, and having a central opening registering with the central passage of the casing, extending therein to above the top flange; ports extending through the plug and terminating above the upper flange; ports in the lower flange connecting the space between the flanges with the side passage in the casing; annular channels in the upper and lower faces of the upper flange; sections of annular rings in said flanges; a cap attached to said plug extending beyond and below the top flange of the plug; an annular internally-threaded ring screwed on the tip-casing, an annular ring above the threaded ring, all constructed and operated substantially as illustrated and described herein.

4. In the herein described hydrocarbon-burner, an automatic regulator therefor comprising a spring-pressed valve, mounted in a valve-chamber, connected by a pipe running from below the valve to the steam-space in the boiler; a port in the valve-chamber, above the valve, connected with a port in the piston-chamber at one side of and at the bottom of the spring-pressed piston in said chamber; said piston having a stem extending into a valve-chamber and connected therein to a hollow valve; said hollow-valve chamber being in communication with the steam-chest of the boiler and also being in communication with the oil and steam valve regulating piston-chamber; a piston in said last chamber having a stem connected to an adjustable link; said link being connected to a lever affixed to the stem of the oil-valve, all constructed and operated substantially as described herein.

5. In the herein-described hydrocarbon-burner means to detach the burner-tip and connecting-pipes from the regulating-valves comprising a coupling member externally and centrally threaded; said member having a central passage therethrough in the front end of which is screwed the oil-conduit which leads to the burner-tip, the rear end of which when in place registering with the passage leading from the oil-regulating valve; ports through said member exterior the oil-conduit opening into the steam-conduit which leads the steam to the burner-tip, which said conduit is screwed into the front end of said member; an internally-threaded coupling-ring having a handle, said coupling-ring being adapted to screw upon said coupling member and attach the same to the casing of the valve-chambers.

709,783. **INSECT-DESTROYING COMPOUND.** JAMES H. LESTER, Roanoke, Va. Filed Apr. 17, 1902. Serial No. 103,447. (No specimens.)

Claim.—A composition for destroying insects comprising the following ingredients in substantially the following proportions, by weight: gunpowder, ten ounces, saltpeter, eight ounces, copperas, four ounces, sulfur, sixteen ounces, substantially as set forth.

709,784. **HAME-HOOK.** GEORGE F. LINDSAY, Sherman, Tex. Filed Apr. 10, 1902. Serial No. 102,300. (No model.)

Claim.—1. The combination with a hame-staple; of a hame-hook comprising two leaves the inner edges of which are provided with eyes which are pivoted upon the hame-hook and the outer edges of which are provided with overlapping hooked bills which project in opposite directions, and a spring exerting its energy to draw the leaves together and thus hold the hooked bills in closed position, substantially as specified.

2. The combination with a hame-staple; of a hame-hook comprising two leaves the inner edges of which are provided with eyes which are pivoted upon the hame-hook and the outer edges of which are provided with overlapping hooked bills which project in opposite directions, a bolt passing through both leaves and provided with a nut, and a spring confined between the nut and the inner leaf and exerting its energy to draw the two leaves together, substantially as and for the purpose set forth.

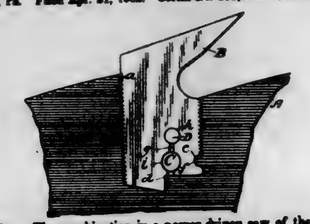
709,785. **TOBACCO-TRUCK.** WILLIAM G. LITTLE, Farmville, N. C., assignor of one-half to Robert L. Davis, Farmville, N. C. Filed June 20, 1902. Serial No. 112,469. (No model.)

Claim.—1. The truck herein described comprising a bed having the longitudinal side beams, and the cross top boards secured at their outer ends upon the upper sides of the side beams, the cross-beam secured beneath the side beams near the front ends of the latter, the brackets for the rear wheels secured at their upper ends to the side beams and inclining thence inwardly toward the lower ends, and provided at such ends with means for securing the rear axle, the rear wheels supported on said axle within the lines of the sides of the bed, the front-wheel frame having a top plate provided with a block and the king-bolt extending therefrom and journaled in the front cross-beam of the bed, the side and intermediate plates secured to the under side of the top plate and spaced apart, the wheels between the side plates and the intermediate plate and spaced apart by the intermediate plate, the draft-bar provided at its rear ends with a central longitudinal slot forming side arms pivoted between their ends between the side plates and the intermediate plate, and a step-rod supported by the said plates and operating above the rear ends of the arms of the draft-bar substantially as and for the purposes set forth.

2. The combination in a truck with the bed and the rear wheels and the supporting devices for the rear wheels, of a pair of front wheels, the front-wheel frame having a top plate, and side and intermediate plates depending from the top plate and spaced apart, the front wheels journaled between the side and intermediate plates and spaced apart by the intermediate plate, the king-bolt connecting the wheel-frame within the truck-bed and the draft-bar provided at its rear end with arms operating between the intermediate plate and the side plates and pivoted thereto, substantially as set forth.

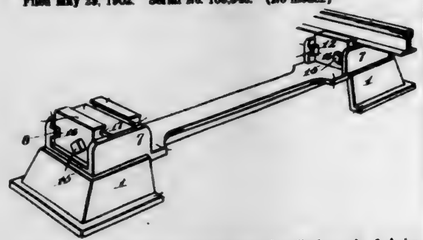
3. The combination in a truck with the bed and the rear wheels, of the front-wheel frame having pivotal connection with the bed and comprising the top plate, and the side and intermediate plates depending from the top plate and spaced apart, the pair of front wheels journaled between the side and intermediate plates and spaced apart by the intermediate plate, the draft-bar provided at its rear end with the arms operating between the intermediate plate and the side plates and pivoted to said plates between their ends, and stop devices for limiting the movement of the draft-bar substantially as set forth.

709,786. POWER-DRIVEN SAW. WILLARD D. LLOYD, Beaver Falls, Pa. Filed Apr. 21, 1902. Serial No. 103,886. (No model.)



Claim.—The combination in a power-driven saw of the saw-plate, having the edge-beveled, lugged and stepped tooth-recess; the saw-tooth, having the bevel-fitting edge groove, the lug-fitting recess at the front end, the rigid, step-fitting shoulder at the extreme lower end, the two-holed, oblique, expansible, flush-edged slit in the lower part of the tooth; and the short, blunt rivet fitted expansively to and in the lower of the holes in the slit of the saw-tooth, all substantially as described, for the purpose of simply and strongly attaching the saw-tooth to the saw-plate.

709,787. COMBINED RAILWAY CROSS-TIE AND CHAIR. SAMUEL LOVE, New York, N. Y., assignor of one-half to Monroe L. Simon. Filed May 29, 1902. Serial No. 109,548. (No model.)



Claim.—1. In a device of the character described, a pair of chairs, a cross-tie integral therewith, a strengthening web integral with the cross-tie, a strengthening-rib integral with each of the chairs and terminating at its top in the said web, a pair of vertical plates integral at each end with the said cross-tie, a bearing-plate arranged between each pair of the said plates, a clamping-plate arranged at each side of the said bearing-plate, a clamping-screw for each of the said clamping-plates extending through the bearing-plates, and a cushioning device mounted upon each of the bearing-plates and engaging the said vertically-extending plates.

2. In a device of the character described, a pair of chairs, a cross-tie integral therewith, a pair of vertical plates at each end of the said cross-tie and provided on the inner face thereof with a rib, a bearing-plate arranged between and integral with said vertical plate, and a clamping device arranged between and engaging the ribs of said vertical plates and removably connected to said bearing-plates.

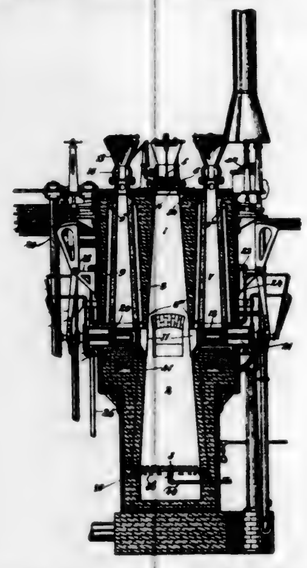
3. In a device of the character described, a pair of chairs, a cross-tie integral therewith, a pair of vertical plates at each end of the said cross-tie and provided on the inner face thereof with a rib, a bearing-plate arranged between and integral with said vertical plate, a clamping device arranged between and engaging the ribs of said vertical plates and removably connected to said bearing-plates, and a cushioning device arranged between and mounted upon said vertical plates.

4. In a device of the character described, a cross-tie provided on its inner face with a strengthening-web, means for supporting said tie, a pair of vertical plates connected to each end of the said tie, a bearing-plate integral with and arranged between the said vertical plates, a clamping device mounted within and retained upon each end of the tie by the said vertical and bearing plates, and a cushioning device mounted upon the said vertical and bearing plates.

5. In a device of the character described, a pair of chairs of shell-like formation, each of which is provided with a strengthening-rib on its inner face, a cross-tie integral with the said chairs and provided with a strengthening-web on its inner face terminating in the rib of the chairs, and a pair of clamping devices for track-rails mounted upon and connected with the said cross-tie.

6. In a device of the character described, a pair of chairs of shell-like formation, each of which is provided with a strengthening-rib, a cross-tie integral with the said chairs and provided with a strengthening-web terminating in the ribs of the chairs, a pair of vertical plates integral with the cross-tie at each end thereof and each of which is provided on its inner face with a rib, a clamping device arranged between each pair of plates and retained therein by means of the ribs of the plates, and a cushioning device mounted upon and extending between the said plates.

709,788. GAS-GENERATOR. CHARLES J. LUTHER, Rodbank, N. J. Filed Dec. 4, 1901. Serial No. 84,666. (No model.)



Claim.—1. In a gas-machine, a generating-chamber, a vaporizing-chamber above the generating-chamber, means for directing liquid to the vaporizing-chamber, vertical retorts surrounding the vaporizing-chamber, there being gas-spaces around the retorts and having communication with the generating-chamber, and valves for normally closing the lower ends of the retorts and adapted to close the gas-spaces, substantially as specified.

2. In a gas-machine, a generator, a vaporizer above generator, means for directing liquid thereto, a series of vertical retorts around the vaporizer, the said retorts being tapered, the larger end being downward, and valves normally closing the lower ends and serving as a means for forcing material into the generator, substantially as specified.

3. A gas-machine comprising a vaporizing-chamber, means for directing liquid to the chamber, retorts surrounding the vaporizing-chamber and having gas-spaces at opposite sides and communicating one with the other at the top, the said gas-spaces communicating with the vaporizing-chamber, hoppers on said retorts, valves in the retorts below the hoppers, and pipes leading outward from the upper ends of the retorts, substantially as specified.

4. A gas-machine comprising a generator, a vaporizing-chamber, means for directing liquid to the chamber, retorts arranged vertically around the vaporizing-chamber and having gas-spaces at their opposite sides, the said gas-spaces communicating one with the other at the top only, and at the bottom with the generator, valve-casings, and valves for operating in said casings and forming the bottoms of the retorts and serving to force material into the generator, substantially as specified.

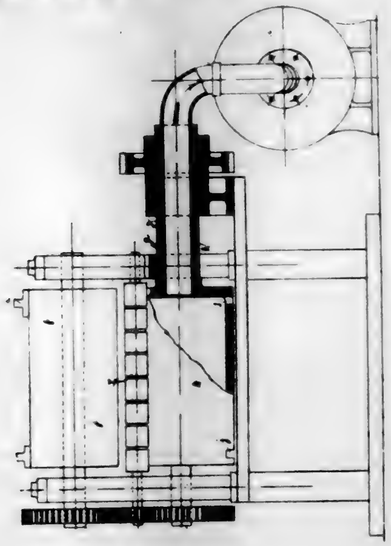
5. A gas-machine comprising a generator and a vaporizing-chamber, means for directing liquid to the chamber, retorts surrounding the vaporizing-chamber, valves forming the bottoms of the retorts, levers connecting with the stems of the valves, segment-racks on said lever, and operating-gearing engaging with said racks, substantially as specified.

6. A gas-machine comprising a generator and a vaporizing-chamber, means for directing liquid to the chamber, retorts surrounding the vaporizing-chamber, there being gas-spaces between the retorts and the said vaporizing-chamber and communicating with the generator, valves for closing the bottoms of the retorts and also for closing said gas-spaces, and means for directing air to the lower portion of the generator, substantially as specified.

7. A gas-machine comprising a generator, a vaporizing-chamber above the same, vertical retorts around the vaporizing-chamber, water-jacketed valve-casings supporting the retorts, valves movable in said casings and adapted to contain water, means for directing water into said valves, and gearing for operating the valves, substantially as specified.

8. In a gas-machine, the combination with a vaporizing-chamber and a generator, of retorts, water-jacketed valve-casings supporting the retorts, discharge-pipes leading from the casings, hollow valves operating in the casings and serving to close the lower ends of the retorts, means for supplying water to the hollow valves, and means for operating the said valves to force material dropping from the retorts to the generator, substantially as specified.

709,789. MECHANISM FOR REMOVING SELVAGE FROM BOX OR CARTON BLANKS. JOSEPH MEEK, Toronto, Canada, assignor to Lever Brothers, Limited, Port Sunlight, England. Filed Mar. 17, 1902. Serial No. 98,610. (No model.)



Claim.—1. A mechanism for removing selvage from box and carton blanks, comprising a pair of rollers, one of the same being hollow, means for rotating said rollers in timed relation to each other, punches carried by one of said rollers, apertures being formed in the hollow roller for receiving said punches whereby said selvage is designed to be passed into said hollow roller, and pneumatic means for removing said selvage therefrom, substantially as described.

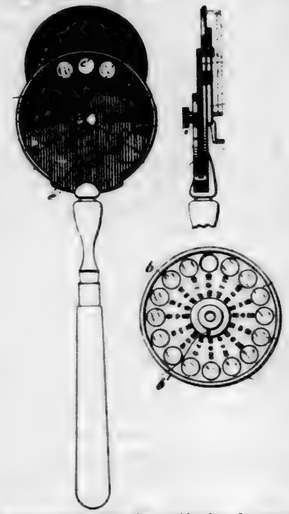
2. In a mechanism of the class described, the combination with a suitable support, of a hollow roller journaled therein, a tube communicating with one of the journals of said roller, means for exhausting atmosphere within said tube, and means for removing the selvage from carton-blanks and delivering the same within said roller, substantially as described.

3. In a mechanism of the class described, the combination with a suitable support, of a hollow roller journaled therein, a second roller mounted contiguous the hollow roller, said hollow roller being provided with a plurality of apertures, a plurality of punches carried by said second-mentioned roller designed to enter said apertures whereby selvage from a carton-blank passed between said rollers may be directed into said hollow roller, and pneumatic means communicating with one of the journals of said hollow roller for removing the selvage therefrom, substantially as described.

709,790. OPHTHALMOSCOPE. EMIL B. MEYROWITZ, New York, N. Y., assignor to the Meyrowitz Manufacturing Company, a Corporation of New Jersey. Filed Sept. 26, 1901. Serial No. 76,901. (No model.)

Claim.—1. In an ophthalmoscope, the combination of a lens-disk, and a concentric supplemental lens-carrier, frictionally connected to rotate together, a frame supporting the disk and carrier, and a look for the said carrier, preventing its rotation with the disk.

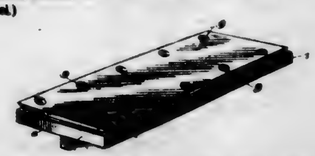
2. In an ophthalmoscope, the combination of a supporting-frame, a lens-disk, and a concentric supplemental lens-carrier, frictionally connected to rotate together and a look for the said carrier, preventing its rotation with the disk, and means for releasing and relengaging said look at the end of each rotation of the disk.



3. In an ophthalmoscope, the combination of a supporting-frame, a lens-disk, and a concentric supplemental lens-carrier, frictionally connected to rotate together and a pawl pivoted to the frame normally engaging the carrier to prevent its rotation and means carried by the disk, for removing the pawl at the end of each rotation, substantially as described.

4. In an ophthalmoscope, the combination of a supporting-frame, a lens-disk, having a plurality of scales marked thereon, a concentric segment carrying supplemental lenses to which the scales correspond, openings in the segment respectively exposing the scales, a guard covering all of said openings except one, a pawl pivoted to the frame adapted to hold the segment stationary and a pin carried by the disk and adapted to remove the pawl.

709,791. ARTIFICIAL-STONE BOARD. ALEXANDER McDONALL, Duluth, Minn. Filed Nov. 14, 1901. Serial No. 82,382. (No model.)



Claim.—1. As an improvement in artificial-stone boards, the combination with the four square edges 1, and the integral web or rib 12, removed some distance from the edges, the said web being of greatest depth adjacent to its center, the depth diminishing gradually toward each end, substantially as set forth.

2. As an improvement in artificial-stone boards, the combination with the four square edges 1, and the integral web or rib 12 removed some distance from the edges with horizontal perforations 13 for the passage of attaching means, substantially as set forth.

3. As an improvement in artificial-stone boards, the combination with the square edges 1, and the integral web or rib 12 interrupted at 17, adjacent to each end, and with horizontal perforations 13 for the passage of attaching means, substantially as set forth.

4. As an improvement in artificial-stone boards, the combination of the square edges 1, with cut-away portions 4, retaining means for the binding material, and the integral web or rib 12, with horizontal perforations 13, for the passage of attaching means, substantially as set forth.

5. As an improvement in artificial-stone boards, the combination of the square edges 1, with cut-away portions 4, retaining means for the binding material, and the integral web or rib 12, interrupted at 17, adjacent to each end, substantially as set forth.

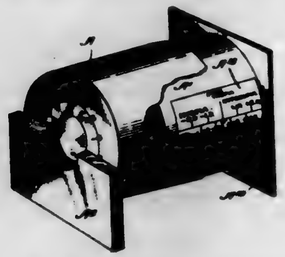
6. As an improvement in artificial-stone boards, the combination of the square edges 1, with cut-away portions 4, retaining means for the

9. As an improvement in artificial-stone boards, the combination with the square edges 1, the cut-away portions 4, the dovetailed edges 6, forming retaining means for the binding material, and the integral web or rib 12, interrupted at 17, adjacent to each end, and with horizontal perforations 13, for the passage of attaching means, substantially as set forth.

10. As an improvement in artificial-stone boards, the combination of the square edges 1, with cut-away portions 4, retaining means for the binding material, and holes 9, through the entire thickness of the board, for fastenings, substantially as set forth.

11. As an improvement in artificial-stone boards, the combination of the square edges 1, with cut-away portions 4, dovetailed edges 6, forming retaining means for the binding material, and holes 9, through the entire thickness of the board for fastenings, substantially as set forth.

709,792. EDUCATIONAL OPTICAL INSTRUMENT. GEORGE W. MCFATRICH, Chicago, Ill. Filed Apr. 16, 1902. Serial No. 103,174. (No model.)



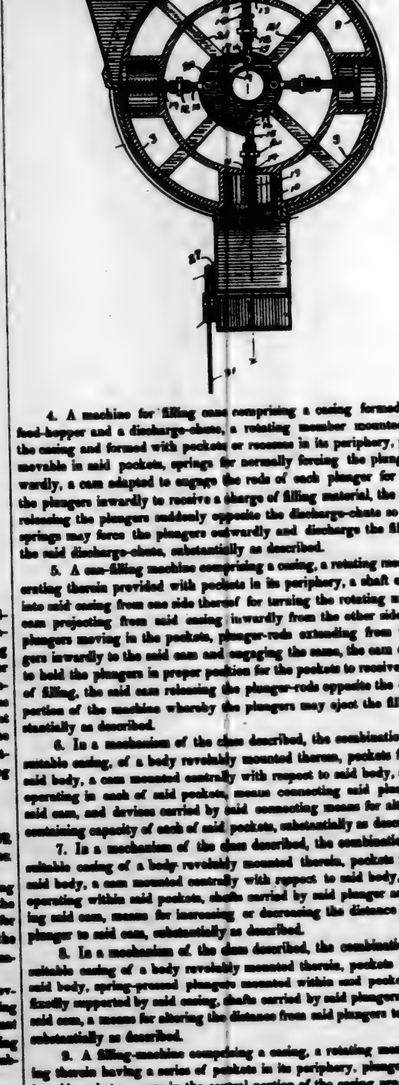
Claim.—In an educational optical instrument, in combination, a cylinder open at one end and closed at the other save for a pupilary opening; a support for the closed end of said cylinder; two lens-receiving cells and an astigmatic scale of degrees on the exterior of said cylinder adjacent to said pupilary opening; two lens-receiving cells on the interior of said cylinder adjacent to said pupilary opening, a biconvex lens for one of said interior cells; a second cylinder open at one end and at the other end provided with a ground-glass screen and a support for the cylinder, said second cylinder being adapted to telescope with said first-mentioned cylinder; and a scale on one of said cylinders for indicating the relative position of said cylinders.

709,793. MEASURING AND DISCHARGING APPARATUS FOR FILLING CANS. JOHN MCSHERRY, South Omaha, Nebr. Filed Dec. 31, 1901. Serial No. 87,805. (No model.)

Claim.—1. A can-filling machine comprising a casing, a revolving member moving therein, having receptacles or pockets for receiving the material operated upon, plungers moving in said pockets and means for drawing the said plungers into position to permit material to enter the pockets, the said means releasing the plungers as they may eject the material from the said pockets, substantially as described.

2. A filling-machine made up of a casing, a rotating member moving within the same having a series of pockets formed therein, ejecting means moving in the said pockets and arranged to regulate the amount of material received in each pocket, and means for releasing the ejecting means to force material out at the delivery portion of the machine, substantially as described.

3. A filling-machine comprising a casing, a rotating member moving within the same having a series of pockets in its periphery, a plunger moving in each pocket, means for normally holding the plungers in their outermost positions, means for drawing the plungers inwardly a proper distance to permit each pocket to receive a suitable charge of the material to be handled, and means for releasing the said plungers quickly for



4. A machine for filling cans comprising a casing formed with a feed-hopper and a discharge-chute, a rotating member mounted within the casing and formed with pockets or recesses in its periphery, plungers movable in said pockets, springs for normally forcing the plungers outwardly, a cam adapted to engage the rods of each plunger for drawing the plungers inwardly to receive a charge of filling material, the said cam releasing the plungers suddenly opposite the discharge-chute so that the springs may force the plungers outwardly and discharge the filling into the said discharge-chute, substantially as described.

5. A can-filling machine comprising a casing, a rotating member operating therein provided with pockets in its periphery, a shaft extending into said casing from one side thereof for turning the rotating member, a cam projecting from said casing inwardly from the other side thereof, plungers moving in the pockets, plunger-rods extending from the plungers inwardly to the said cam and engaging the same, the cam operating to hold the plungers in proper position for the pockets to receive a charge of filling, the said cam releasing the plunger-rods opposite the discharge portion of the machine whereby the plungers may eject the filling, substantially as described.

6. In a mechanism of the class described, the combination with a suitable casing, of a body revolubly mounted therein, pockets formed in said body, a cam mounted centrally with respect to said body, a plunger operating in each of said pockets, means connecting said plunger with said cam, and devices carried by said connecting means for altering the containing capacity of each of said pockets, substantially as described.

7. In a mechanism of the class described, the combination with a suitable casing of a body revolubly mounted therein, pockets formed in said body, a cam mounted centrally with respect to said body, plungers operating within said pockets, shafts carried by said plunger and engaging said cam, means for increasing or decreasing the distance from said plunger to said cam, substantially as described.

8. In a mechanism of the class described, the combination with a suitable casing of a body revolubly mounted therein, pockets formed in said body, spring-pressed plungers mounted within said pockets, a cam fixedly supported by said casing, shafts carried by said plungers engaging said cam, a means for altering the distance from said plungers to said cam, substantially as described.

9. A filling-machine comprising a casing, a rotating member moving therein having a series of pockets in its periphery, plungers moving in said pockets, a cam in the central portion of the casing provided with a groove in its periphery, antifriction-rollers carried by the plunger-stems engaging the overhanging flanges of the cam-groove, the said cam-groove having an opening at one portion and being shaped so as to lead the rollers inwardly for a distance and then suddenly release them so that the plungers may be forced outwardly at this point after which the rollers

---

plungers and projecting inwardly through the bottoms of said receptacles, a cam carried by said casing, shafts engaging the same, all of said shafts being threaded upon their free ends, and elongated nuts connecting the plunger-shafts with the cam-connecting shafts, substantially as described.

12. In a mechanism of the class described, the combination with a suitable casing, of receptacles movably mounted therein, a cam carried by said casing, plungers operable within said receptacles, shafts carried by said plungers and projecting inwardly through the bottoms of said receptacles, and threaded on their inner ends, shafts engaging said cam, projecting outwardly and provided with threads upon their outer ends running in an opposite direction to that of the threads of the plunger-shafts, elongated nuts threaded onto and inclosing the contiguous ends of said shafts, and means for preventing rotation of said shafts, substantially as described.

709,794. CONCRETE ARCH CONSTRUCTION. WALTER C. PARKER, Cleveland, Ohio. Filed Feb. 28, 1902. Serial No. 96,603. (No model.)

Claim.—1. In a concrete arch, the combination of bars transverse to the axis of the arch and passing through regions of tension in both intrados and extrados, and other bars extending longitudinally with the axis of the arch.

2. In a concrete arch, the combination of bars transverse to the axis of the arch and passing continuously through all the regions of tension in intrados or extrados of the arch, other transverse bars passing through regions of tension in both intrados and extrados of the arch, and longitudinal bars extending in the direction of the axis, substantially as described.

3. In a concrete arch, the combination of bars transverse to the axis and passing continuously through all the regions of tension in one side of the arch, other transverse bars in one of the sides of the arch and passing through part only of that side, and longitudinal bars extending in the direction of the axis.

4. In a concrete arch, the combination of bars transverse to the axis of the arch and passing continuously through all the regions of tension in one side thereof, other transverse bars in one of the sides of the arch and passing through part only of that side, and longitudinal bars attached to the transverse bars at points intermediate the tensional regions.

5. In a concrete arch, the combination of bars transverse to the axis of the arch and each passing continuously through regions of tension in both intrados and extrados, and other bars extending longitudinally with the axis of the arch, said longitudinal bars being attached to the transverse bars at points intermediate between the intrados and extrados tensional regions.

6. In a concrete arch, the combination of bars transverse to the axis of the arch in both intrados and extrados, the bars on one side extending continuously through all the regions of tension on that side, and those on the other side extending through a single tensional region and far enough beyond to give secure anchorage, and longitudinal bars attached to the continuous tensional bars, substantially as described.

7. In a concrete arch, the combination of bars transverse to the axis of the arch and extending continuously through all the regions of tension in one side of the arch, other transverse bars attached thereto and passing through the body of the arch and into the other side where they pass through a single tensional region, and longitudinal bars extending in the direction of the axis of the arch.

8. In a concrete arch, the combination of bars transverse to the axis of the arch in the intrados thereof, and other bars in the extrados thereof,

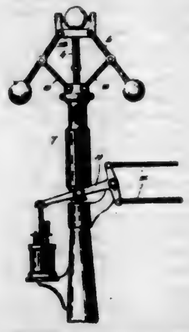
11. In a concrete arch, the combination of bars transverse to the axis of the arch and passing continuously through all the regions of tension in both intrados and extrados, with longitudinal bars extending in the direction of the axis.

12. In a concrete arch, the combination of bars transverse to the axis of the arch and passing continuously through all the regions of tension in both intrados and extrados, with longitudinal bars extending in the direction of the axis and being attached to the transverse bars at points intermediate the tensional regions, substantially as described.

13. In a concrete arch, the combination of bars transverse to the axis of the arch and passing continuously through regions of tension in both intrados and extrados, and other bars extending longitudinally with the axis of the arch, substantially as described.

14. In a concrete arch, the combination of bars transverse to the axis of the arch and extending continuously through all the regions of tension in one side of the arch, other transverse bars attached thereto and passing through the body of the arch and into the other side, and longitudinal bars extending in the direction of the axis.

709,795. STEAM-ENGINE GOVERNOR. RALPH J. PATTERSON, Woburn, Mass. Filed Apr. 12, 1901. Serial No. 55,602. (No model.)



Claim.—1. In an engine-governor, a governor-spindle, centrifugal arms pivoted thereto, vertically-disposed arms rigidly but detachably connected to the said centrifugal arms at their pivotal point of connection with the governor-spindle, an inertia-weight loosely carried by said governor-spindle, and flexible connections between the said vertically-disposed arms and the inertia-weight.

2. In a centrifugal governor, a governor-spindle, centrifugal levers connected thereto, vertical arms detachably secured to the said centrifugal levers at their pivotal points, a head mounted for rotation on said governor-spindle and having oppositely-disposed arms extending therefrom, inertia-weights on said arms, and flexible connections between said vertically-disposed arms and the arms supporting the inertia-weights.

3. In a centrifugal governor, a governor-spindle, centrifugal levers connected thereto, vertical arms detachably secured to the said centrifugal levers at their pivotal points, a head mounted for rotation on said governor-spindle and having oppositely-disposed arms extending therefrom, inertia-weights on said arms, links pivotally connected to said vertically-disposed arms, and to the arms supporting the inertia-weights.

4. In a centrifugal governor, a governor-spindle, centrifugal levers connected thereto, vertical arms detachably secured to the said centrifugal levers at their pivotal points, a head mounted for rotation on said governor-spindle and having oppositely-disposed arms extending therefrom, inertia-weights on said arms, links pivotally connected to said vertically-disposed arms and to the arms supporting the inertia-weights, the dis-

tance between the axis of the governor-spindle and the point of connection between the said links and the arms supporting the inertia-weights being equal to the distance between the axis about which the centrifugal levers turn and the point of pivotal connection between the said links and the vertically-disposed arms.

5. In an apparatus of the class described, a centrifugal governor, combined with a dash-pot connected to the reach-rods of the engine, said dash-pot comprising a cylinder containing a resistance medium, a piston in said cylinder, and adjustable mechanism to independently regulate the speed of the piston in each direction, whereby the said piston may be made to move more freely in one direction than in the other.

6. In an apparatus of the class described, a centrifugal governor, an inertia device carried thereby, combined with a dash-pot connected to the reach-rods of the engine, said dash-pot comprising a cylinder containing a resistance medium, a piston in said cylinder, and adjustable mechanism to independently regulate the speed of the piston in each direction, whereby the said piston may be made to move more freely in one direction than in the other.

7. A dash-pot for engine-governors, comprising a cylinder containing a resistance medium, a piston working in said cylinder, said piston having two ports or openings therethrough, and spring-pressed valves controlling said ports and openings in opposite directions, the stems of said valves extending through the head of the cylinder.

8. A dash-pot for engine-governors, comprising a cylinder containing a resistance medium, a piston working in said cylinder, said piston having two ports or openings therethrough, spring-pressed valves controlling said ports and opening in opposite directions, and means operable from the outside of the cylinder to vary the tension on the two springs independently, whereby the piston may be made to move more freely in one direction than in the other.

9. A dash-pot for engine-governors, comprising a cylinder containing a resistance medium, a piston in said cylinder having two ports therein, spring-controlled valves controlling said ports, said valves opening in opposite directions and having their stems projecting through the head of the cylinder, and means for adjusting the tension of the springs, whereby the valves may be so regulated that the piston will move freely in one direction but will be retarded in its movement in the opposite direction.

10. A dash-pot for engine-governors, comprising a cylinder containing a resistance medium, a piston in said cylinder having two ports therein, valves controlling said ports and opening in opposite directions, each valve being carried by a stem which projects through the head of the cylinder, a cross-piece fast on the piston-rod, and means for yieldingly connecting said valve-stems to said cross-piece.

11. In an engine-governor, a governor-spindle, weighted centrifugal levers pivoted thereto, vertically-disposed arms detachably secured to said centrifugal levers at their pivotal point, an inertia-weight loosely carried by said governor-spindle, and flexible connections between the said arms and the inertia-weight, combined with a dash-pot connected to the governor, said dash-pot comprising a cylinder containing a resistance medium, a piston working therein, said piston having two ports, spring-controlled valves controlling said ports, and opening in opposite directions, and means for adjusting the tension of the springs.

12. In an engine-governor, a governor-spindle, weighted centrifugal levers pivoted thereto, vertically-disposed arms rigidly but detachably secured to said centrifugal levers, said vertical arms extending upwardly beyond the pivotal points of the said centrifugal levers, an inertia-weight loosely carried by said governor-spindle, and flexible connections between said vertically-disposed arms and the inertia-weight.

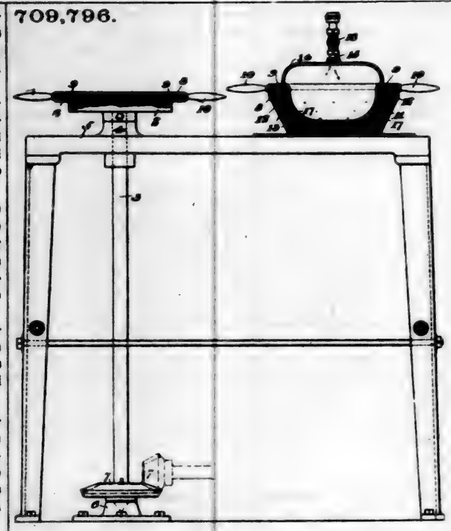
709,796. METHOD OF MAKING HOLLOW GLASS ARTICLES. DANIEL C. RIPLEY, Pittsburg, Pa., assignor to United States Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Oct. 23, 1901. Serial No. 79,511. (No model.)

Claim.—1. The method of forming a blank for cut-glass articles, consisting in expanding glass within a mold and simultaneously forming small projections or indentations upon its exterior, and then cutting a pattern thereon using said projections or indentations as guides; substantially as described.

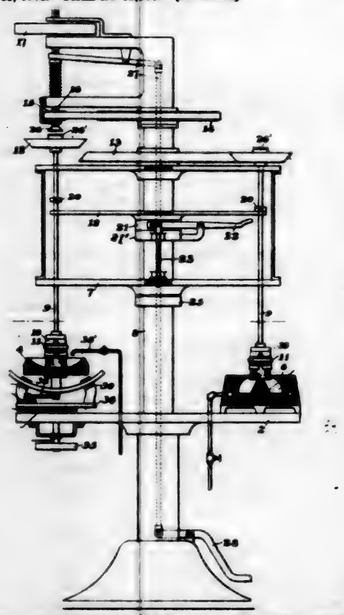
2. The method of forming hollow glass articles, consisting in feeding glass upon a base within a frame, rotating the base and surrounding the glass within the frame, bringing the frame with the contained glass plate into opposition to a mold, and forcing the plate into the mold-cavity; substantially as described.

3. The method of forming hollow glass articles, consisting in spreading plastic glass into plate form with one face out of contact with any forming-surface, and then forcing the glass plate while still plastic into a matrix with the side of the plate which was in contact with the forming-surface directed toward the matrix; substantially as described.

709,796.



709,797. APPARATUS FOR THE MANUFACTURE OF GLASSWARE. DANIEL C. RIPLEY, Pittsburg, Pa., assignor to United States Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Nov. 13, 1901. Serial No. 82,103. (No model.)



Claim.—1. Apparatus for finishing blown-glass articles, comprising at successive stations a cracking-off and a finishing device, and a carrier having inverted dependent holders adapted to carry glass articles successively to said stations; substantially as described.

2. Apparatus for finishing blown-glass articles, comprising at successive stations a cracking-off, a grinding, and a fire-finishing device, and a carrying-frame having inverted dependent holders adapted to carry glass articles at their lower ends successively to said stations; substantially as described.

3. Apparatus for finishing glass articles, comprising at successive stations a cracking-off, a grinding, a drying, and a fire-finishing device, and a carrier having inverted holders by which glass articles are carried successively to said stations; substantially as described.

4. Apparatus for finishing glass articles, comprising at successive stations, a grinding and a fire-finishing device, and a carrier having inverted dependent holders adapted to carry glass articles successively to said stations; substantially as described.

5. Apparatus for finishing glass articles, comprising at successive stations, a cracking-off, a grinding, and a fire-finishing device, and a carrier having inverted dependent holders adapted to carry glass articles successively to said stations, substantially as described.

6. Apparatus for finishing glassware, comprising stations at which glass articles are successively treated by devices situate thereat, of spindles carrying the glass articles, a rotary frame for the spindles, and means for raising the spindles and the glass articles above the level of the said devices; substantially as described.

7. A drying and wiping device for glass articles comprising an air-blast pipe, and a rotary brush, the one adapted to direct a blast of air upon the article, and the other to brush the surface of the same; substantially as described.

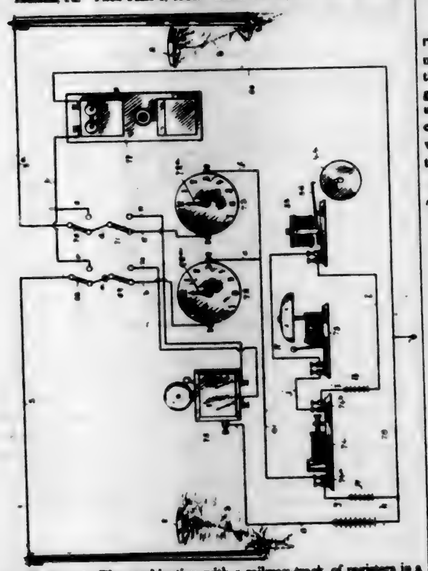
8. Apparatus for finishing blown-glass articles, comprising at successive stations, a cracking-off, a grinding, and a finishing device, and a carrier having inverted dependent holders adapted to carry glass articles successively to said stations; substantially as described.

9. Apparatus for finishing blown-glass articles, comprising at successive stations a cracking-off, a grinding, and a fire-finishing device, a chuck arranged to hold the article, and a carrier by which the chuck is carried in inverted dependent position successively to said stations; substantially as described.

10. Apparatus for finishing glass articles, comprising at successive stations a cracking-off, a grinding, a drying, and a fire-finishing device, a chuck arranged to hold the article, and a carrier by which the chuck is carried in inverted dependent position successively to said stations; substantially as described.

11. Apparatus for finishing glass articles comprising at successive stations a grinding and a fire-finishing device, a chuck arranged to hold the article, and a carrier by which the chuck is carried in inverted dependent position successively to said stations; substantially as described.

709,798. RAILWAY SIGNALING APPARATUS. EDWARD ROWE, Indiana, Pa. Filed June 1, 1901. Serial No. 62,785. (No model.)



Claim.—1. The combination with a railway-track, of registers in a station or tower, contacts arranged adjacent the track and in circuit with the registers, a locomotive having a contact adapted to engage with the first-named contact, and an alarm in the locomotive to operate, said operation being controlled by the operator in the station.

2. The combination with a railway-track, of registers, contacts arranged adjacent the track in circuit with the registers, a locomotive having a contact adapted to engage with the first-named contact, and an alarm in the locomotive, a second circuit provided for said alarm, and an increased battery-power in the path of the second circuit whereby a current may be generated in the second circuit to actuate the alarm.

3. The combination with the railway-track, of registers, contacts arranged adjacent the track in circuit with the registers, a locomotive having a contact adapted to engage with the first-named contact and an alarm in the locomotive, a second circuit provided for said alarm and having an increased battery-power whereby the alarm in the locomotive will ring only when the second circuit is closed.

4. The combination with a railway-track, of registers in a station or tower, contacts arranged adjacent the track and in circuit with the registers, a locomotive having a contact adapted to engage the first-named contact, an alarm in the locomotive adapted to operate, said operation being controlled by the operator in the station, and an annunciator in the station to show that the alarm has been sounded on the locomotive.

5. The combination with a railway-track, of registers in a station or tower, contacts arranged adjacent the track and in circuit with the registers, a locomotive having a contact adapted to engage the first-named contact, and a circuit arranged, whereby communication may be had between the operator in the station and an operator in the locomotive.

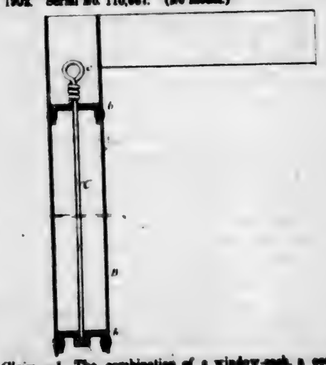
6. A system comprising registers in a tower or station, a circuit provided for the registers, contacts arranged adjacent a track in the path of the circuit, a second circuit including an alarm arranged in a locomotive, and an annunciator in the tower, said circuit being designed to be closed when the first circuit is broken so as to actuate the alarm and the annunciator, and another circuit including wires whereby communication may be had between the operator in the tower and the operator in the locomotive when the first two circuits are cut out.

7. A system comprising a circuit including registers, and a receiving device arranged in a tower or station, contacts in the path of the circuit and arranged adjacent a railway-track, a second circuit including an alarm arranged in a locomotive, and an annunciator in the tower, said circuit being designed to be closed when the first circuit is broken so as to actuate the alarm and the annunciator, and another circuit including wires whereby communication may be had between the operator in the tower and the operator in the locomotive, when the first two circuits are cut out.

709,799. METHOD OF IMPREGNATING WOOD. MAX RÜPING, Charlottenburg, Germany. Filed Mar. 31, 1902. Serial No. 100,902. (No specimens.)

Claim.—A method of impregnating wood and other porous material consisting in subjecting the material to be impregnated before its treatment with the impregnating liquid, to a strong air or gas pressure, so that the cells, pores or cavities are first filled with highly-compressed air or gas which after the material has been treated with impregnating liquid under still greater pressure, presses by its expansion when the pressure is cut off and if desired a vacuum created the excess of impregnating liquid wholly or partly out of the cells, pores or cavities of the material substantially as described.

709,800. AUTOMATIC RELEASING DEVICE FOR WINDOW-SASHES. CHARLES RUPP, Philadelphia, Pa., assignor to J. S. Thorne Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed June 7, 1902. Serial No. 110,687. (No model.)



Claim.—1. The combination of a window-sash, a counterweight having means for operatively connecting it to said sash, said means be-

ing detachably held to the sash at a point adjacent to its lower edge, substantially as described.

2. The combination of a window-sash, a counterweight and a connection between said two members, the same having means attaching it to the sash at a point adjacent to the lower edge thereof, and being constructed to automatically operate to disconnect said sash from its counterweight upon a predetermined rise of pressure, substantially as described.

3. The combination of a window-sash, a counterweight and a connection between said two members, with a device normally attaching said connection to the lower portion of said sash and including fusible material whereby the sash is disconnected from the counterweight when said device is exposed to a predetermined rise of temperature, substantially as described.

4. The combination of a window-sash, a counterweight therefor, a connection between said two members, a portion of said connection extending to the lower part of the sash, a body of material upon the connection whereby the latter is attached to said sash, said material having a relatively low fusing-point, substantially as described.

5. The combination of a sash, a counterweight therefor, a connection extending between said two members, said connection passing through a side member of the sash to the lower portion thereof, with a body of the material of relatively low fusing-point holding the connection to the sash, substantially as described.

6. The combination of a window-sash, a counterweight therefor, a chain extending between said two members, a portion of the chain passing through the side member of the sash to the lower edge thereof and having a body of material of relatively low fusing-point normally holding it to the sash, substantially as described.

7. The combination of a window-sash, a counterweight therefor, a chain connecting said two members, said chain passing through one of the side members of the sash, and being held to the sash by a body of material of relatively low fusing-point having a body of relatively infusible material substantially surrounding it, substantially as described.

8. The combination of a frame, a window-sash mounted therein, rods extending through the side members of the sash, counterbalancing devices attached to the upper ends of said rods and a flexible band attached to the lower end of the rods and bearing against the outer side of the sash, substantially as described.

9. The combination of a frame, a window-sash mounted therein, rods extending through the side members of the sash, counterbalancing devices attached to the upper portions of said rods, the lower ends of the rods being roughened and a flexible band secured to the roughened portions of the rods and bearing against the outer side of the sash, substantially as described.

709,801. PROPELLER. DAVID SELKIRK, Brooklyn, N. Y. Filed Nov. 21, 1901. Serial No. 83,197. (Model.)

Claim.—1. A propeller-blade provided at one edge with lateral curved blades of varying pitch extending at an angle to the working face of the blade substantially as described.

2. A propeller-blade provided with lateral blades extending from one edge thereof, said lateral blades arranged at an angle to the working face of the propeller-blade.

3. A propeller-blade having extending from one edge thereof, laterally-curved blades of varying pitch.

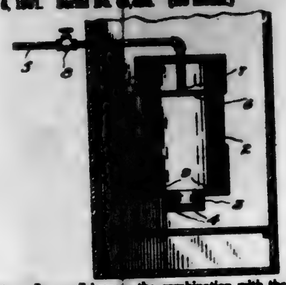
709,802. BOWLING-ALLEY. HENRY J. SHEELAN, Brooklyn, N. Y. Filed July 3, 1902. Serial No. 114,351. (No model.)

Claim.—1. In a bowling-alley, the combination of a playing-floor provided with longitudinal slots, pins upon the upper surface of the floor, an operating device extending beneath the floor, and cords extending through the slots and connecting the pins with the operating device, said cords having free movement in the slots when the pins are forced back under the impact of a ball, substantially as described.

2. In a bowling-alley, the combination of a playing-floor provided with longitudinal slots, pins upon the upper surface of the floor, an operating device extending beneath the floor, and elastic cords extending through the slots and connecting the pins with the operating device, substantially as specified.

3. In a bowling-alley, the combination of a playing-floor provided with longitudinal slots, pins upon the upper surface of the floor, an operating device extending beneath the floor, and cords extending through the slots and connecting the pins with the operating device and having elastic sections, substantially as set forth.

709,803. OIL-BURNER. JOHN P. SWANSON, Oakland, Cal. Filed June 6, 1901. Serial No. 63,403. (No model.)

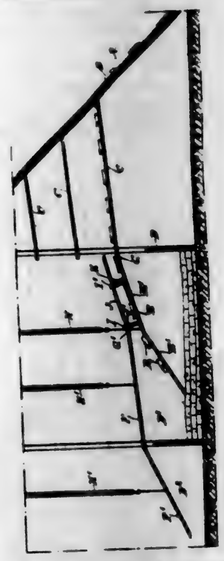


Claim.—In an oil-burner, the combination with the shell having a free and unobstructed inner surrounding vertical wall, a flat ledge secured to and surrounding the bottom of the shell having a depending perforated nipple, a central opening in the ledge in communication with the nipple, of an oil-pipe having a supply-opening, said pipe projecting centrally within the shell and provided on its free end with a disk arranged out of contact with the wall of the shell and made of a diameter larger than the opening in the ledge so as to permit of the oil from said disk to flow therefrom to said ledge, substantially as specified.

709,804. SIX-GUN. HENRY B. SWEENY, Gunnedah, N. Y. Filed Nov. 13, 1901. Serial No. 82,132. (No model.)

Claim.—1. An ice-run, comprising a permanent inclined delivery-chute, a pair of distributing-chutes, the lower chute normally occupying an aligned relation to the delivery-chute and the upper chute being carried

to a point beyond the lower chute, and a switch pivotally supported on the lower chute and having its pivoted end in aligned relation to the upper distributing-chute, the free end of said switch being shiftable relative to the delivery-chute and adapted to bridge the space between said delivery-chute and that end of the upper distributing-chute which has a disaligned relation to said delivery-chute.



2. An ice-run having a distributing-chute, upstanding pivotal and guide posts on said chute, an overlying distributing-chute, a switch pivoted on said pivotal posts to occupy an aligned relation to the overlying chute and shiftably fitted between the guide-posts, means for adjusting said switch, and suitable delivery means to direct the load to one or the other of the chutes.

3. An ice-run having a series of permanent delivery-chutes, a pair of connected distributing-chutes having an intermediate adjustable switch, and means for vertically adjusting the connected chutes and the switch to bring the same into operative relation to either of the permanent delivery-chutes.

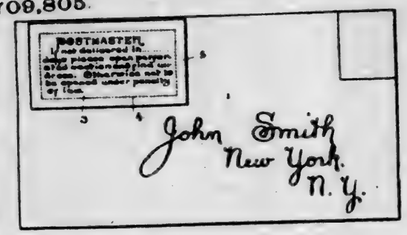
4. An ice-run having a series of permanent delivery-chutes, a pair of connected distributing-chutes, the lower of which has an inclined upper section extending beyond the upper end of the upper distributing-chute, means for suspending and vertically adjusting the pair of chutes to bring them into operative positions relative to either of the delivery-chutes of the series, a switch mounted on the lower distributing-chute, with a pivoted end in flank relation to the upper distributing-chute, and extending over the projecting end of the lower chute, and means for adjusting the switch.

5. An ice-run, provided with a series of fixed chutes, two distributing-chutes, one arranged above and extending beyond the other, a switch pivoted on one of said chutes at a suitable point above the bottom thereof, means for adjusting the switch into an open or closed position, and means for adjusting said distributing-chutes and the switch into several operative positions and with relation to the series of fixed chutes.

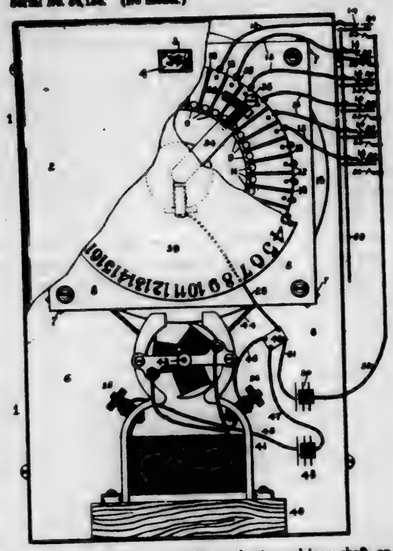
709,805. ENVELOP. FRANK R. STRAHIN and CLYDE R. WEBER, Greeley, Colo.; said Weber assignor to said Strahin. Filed Oct. 22, 1901. Serial No. 79,726. (No model.)

Claim.—The combination with an ordinary envelop having directly marked on the upper left-hand corner of the face thereof the name and address of the writer, of a rectangular strip of paper having on one portion printed instructions provided with perforations surrounding the same, and a continuous surrounding gummed marginal edge whereby to secure the strip over and around the name and address of the writer so as to conceal the same from view, and the said printed instructions adapted to be detachably disconnected from the said gummed marginal edge by means of said perforations thereby exposing the said name and address of the writer, substantially as specified.

709,805.



709,806. ELECTRICAL INDICATOR. HORATIO S. TITUS, Los Angeles, Cal., assignor of five-sixths to Frank F. Wear, Adolph Gensenderfer, and William Barker, Los Angeles, Cal. Filed Nov. 20, 1901. Serial No. 84,138. (No model.)



Claim.—1. An electrical indicator having a driven shaft, an indicator-shaft, a dial thereon, segments having connections, circuit-closers having connections, an arm on the indicator-shaft in contact with said segments and having connections and means for forcing the indicator-shaft normally into contact with the driven shaft.

2. An electrical indicator having a driven shaft, an indicator-shaft, a dial thereon, segments having connections, circuit-closers having connections, an arm on the indicator-shaft in contact with said segments and having connections and an electromagnetic clutch for forcing the indicator-shaft normally into contact with the driven shaft.

3. An electrical indicator provided with a driven shaft carrying a sheave-wheel, a motor having an armature-shaft carrying a sheave-wheel belted to the first wheel, connections between the motor and the source of electrical supply, an indicator-shaft, a dial thereon, an arm on the latter shaft constructed to make contact with the terminals of electrical connections and means for causing said shafts to rotate together, so that a predetermined character on the dial may be displayed.

4. An electrical indicator provided with a motor having connection with the source of electrical supply and having an armature-shaft, a sheave-wheel thereon, a driven shaft, a sheave-wheel on the latter belted to the first wheel, whereby the driven shaft is rotated when the motor-circuit is closed and means for closing said circuit.

5. An electrical indicator provided with a driven shaft carrying a contact-disk, means for rotating said shaft, an indicator-shaft, terminals having connection with the source of electrical supply, a device on the indicator-shaft to make connection with said terminals and means on the latter shaft having electrical connection therewith and with said source of supply, whereby said means is caused to contact and move with said disk when the circuit through said means is closed.

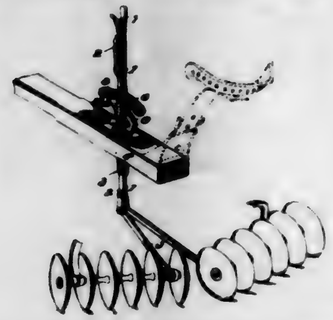
6. An electrical indicator provided with a driven shaft carrying a contact-disk, means for rotating said shaft, an indicator-shaft, terminals having connection with the source of electrical supply, circuit-closers in said connections, a device on the indicator-shaft to make connection with said terminals, and means on the indicator-shaft having electrical connection therewith and with said source of supply, whereby said means is caused to contact with said disk when said circuit-closers are operated.

7. An electrical indicator provided with a driven shaft carrying a contact-disk, means for rotating said shaft, an indicator-shaft, terminals having connection with the source of electrical supply, a device on the indicator-shaft to make contact with said terminals and an electromagnetic clutch having electrical connection with the latter shaft and with said source of supply, constructed to contact and move with said disk when the circuit is closed through said clutch.

8. An electrical indicator having a casing provided with a vision-opening, a motor having electrical connection with the source of supply and having an armature-shaft carrying a wheel, a driven shaft carrying a wheel belted to the first wheel and having a contact-disk, an indicator-shaft carrying a dial, terminals having connection with the source of supply, circuit-closers in said connections, a device on the indicator-shaft to make contact with said terminals and means on said shaft having connections, whereby when the circuit-closers are operated said means is caused to contact and move with said disk.

9. An electrical indicator having a casing provided with a vision-opening, a motor having electrical connection with the source of supply and having an armature-shaft carrying a wheel, a driven shaft carrying a wheel belted to the first wheel and having a contact-disk, an indicator-shaft carrying a dial, terminals having connection with the source of supply, circuit-closers in said connections, a device on the indicator-shaft to make contact with said terminals and an electromagnetic clutch on said shaft having connections, whereby when the circuit-closers are operated said clutch is caused to contact and move with said disk.

709,807. LEVER MECHANISM. HARRIS J. TOOT, Buffalo, N. Y., assignor to Buffalo Pitts Company, Buffalo, N. Y., a Corporation of New York. Filed Sept. 30, 1901. Serial No. 76,681. (No model.)



Claim.—1. The combination with a main lever, of a lever mounted on one side of and carried by said main lever, said second lever having a tooth on one side, means for holding the main lever, and a segmental rack mounted on each main lever with which the teeth of the other lever engages, said latter lever being movable laterally away from the main lever to disengage the teeth from each segmental rack, as set forth.

2. The combination with a main lever, of a lever mounted on one side of and carried by said main lever, said second lever having a tooth on one side, means for holding the main lever, a segmental rack on one side of each main lever, having a guide-bar parallel therewith, the other lever being movable between each rack and guide-bar, and a spring bearing against the guide-bar for holding the teeth of the lever in engagement with each rack, substantially as set forth.

709,808. CARBORUNDUM ARTICLES AND PROCESS OF MAKING SAME. FRANK J. TONE, Niagara Falls, N. Y., assignor to the Carborundum Company, Niagara Falls, N. Y., a Corporation of Pennsylvania. Filed Jan. 2, 1901. Serial No. 41,288. (No specimens.)

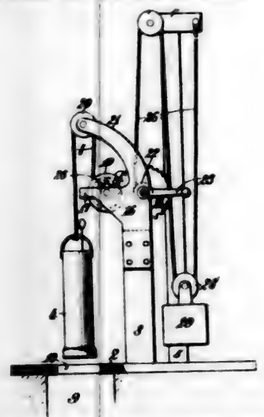
Claim.—1. The method herein described which consists in compressing into coherent form a mass containing non-crystalline material adapted under heat to form crystalline carbid, and then crystallizing it by subjecting it to intense heat; substantially as described.

2. The method herein described which consists in compressing into coherent form a body of amorphous carbid and then crystallizing it by subjecting it to intense heat; substantially as described.

3. As a new article of manufacture, a coherent crystallized body containing non-crystalline carbid having a porous structure and formed by crystallization of a compressed mass of carbid-forming material; substantially as described.

4. The method herein described which consists in compressing into coherent form a mixture composed partly of amorphous carbid and partly of the crude materials from which carbid is made, and then crystallizing such body by subjecting it to intense heat; substantially as described.

709,809. WATER-ELEVATOR. LUTHER WELLS, Versailles, Ky. Filed Nov. 5, 1901. Serial No. 81,314. (No model.)



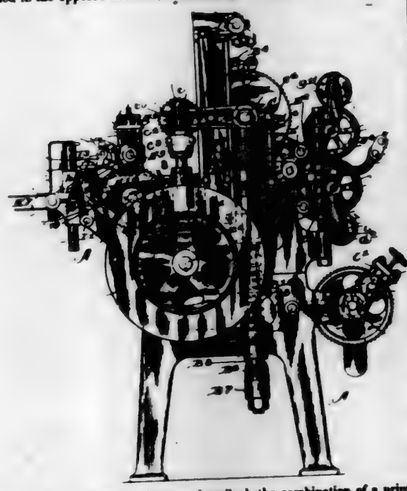
Claim.—In a water-elevator, the combination of a standard, a bracket having side cheeks or plates rigidly fastened to the opposite sides of said standard, and a transverse bar united to said side cheeks or plates said cheeks or plates having upwardly and outwardly projecting arms, a drum supported between said plates at the forward side thereof, a guide-pulley supported between said arms, a rope wound on said drum and extending upwardly therefrom and then downwardly and passing over said pulley, a bucket carried by said rope and having a valve, means for operating said valve, an arm loosely mounted upon the shaft of said drum having a wedge adapted to be inserted between one end of the drum and the adjacent cheek or plate of said bracket, a weight provided with a pulley, a second drum also supported between said cheeks or plates and operatively connected with the other drum and having a hand-crank, a pulley supported above said second drum, and a rope wound upon said second drum and extending upward therefrom over said last-mentioned pulley and then downward and under the pulley on said weight and then upward and fastening at a suitable point.

709,810. PRINTING-MACHINE. FRANK J. WEBER, Chicago, and BYRON B. CARTER, Hinsdale, Ill., assignors, by mesne assignments, to the D. & W. Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Aug. 13, 1900. Serial No. 26,736. (No model.)

Claim.—1. In a machine of the type described the combination of a printing-drum, means to impart a reciprocating motion to said drum, said means comprising rods fitted to and longitudinally movable in suitable bearings in the machine-frame to which said drum is rigidly secured, a cross-head secured to said rods, a toggle or toggles connected to said cross-head at one end and to the machine-frame at the other, means to flex and straighten said toggle or toggles, a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts supported so as to be movable toward and from each other on which said number-wheels and platen-wheels are carried, means, controlled by the movement of the printing-drum, for imparting movement to said shafts toward and from each other and for rotating said number-wheels and platen-wheels, a feed mechanism consisting of sectional feed-rolls and means for rotating said feed-rolls, a perforating cutter or cutters secured between sections of one of said feed-rolls and a groove or grooves adapted to receive said cutter or cutters formed in the opposed feed-roll, substantially as described.

2. In a machine of the type described, the combination of a printing-drum, means to impart a reciprocating motion to said drum, said means comprising rods fitted to and longitudinally movable in suitable bearings in the machine-frame to which said drum is rigidly secured, a cross-head secured to said rods, a toggle or toggles applied to said cross-head and means to straighten and flex said toggle or toggles, a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts supported so as to be movable toward and from each other on which said number-wheels and platen-wheels are carried, means, controlled by the movement of the printing-drum for imparting movement to said shafts toward and from each other and for rotating said number-wheels and platen-wheels, a feed mechanism consisting of sectional feed-rolls and means for rotating said feed-rolls, a perforating cutter or cutters secured between sections of one of said feed-rolls and a groove or grooves adapted to receive said cutter or cutters formed in the opposed feed-roll, substantially as described.

bearings in the machine-frame to which said drum is rigidly secured, a cross-head to which said rods are secured, a toggle or toggles applied to said cross-head, means to straighten and flex said toggle or toggles, heads or disks revolubly supported at the ends of said printing-drum, inking-rolls held yieldingly in contact with the perimeter of said printing-drum and connected to said revolubly heads or disks, means to rotate said heads or disks, said means comprising a shaft revolubly mounted in arms carried on the rods which support the printing-drum, pinions on said shaft which engage gears on said heads or disks, a shaft secured against longitudinal movement in a suitable bearing in the machine-frame, a beveled gear splined to said shaft and maintained in permanent engagement with a beveled gear secured to the pinion-shaft and a beveled gear on said shaft so mounted in the machine-frame which engages a beveled gear on the main driving-shaft of the machine, a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts supported so as to be movable toward and from each other on which said number-wheels and platen-wheels are carried, means, controlled by the movement of the printing-drum for imparting movement to said shafts toward and from each other and for rotating said number-wheels and platen-wheels, a feed mechanism consisting of sectional feed-rolls and means for rotating said feed-rolls, a perforating cutter or cutters secured between sections of one of said feed-rolls and a groove or grooves adapted to receive said cutter or cutters formed in the opposed feed-roll, substantially as described.



3. In a machine of the type described, the combination of a printing-drum, means to impart a reciprocating motion thereto, said means comprising rods fitted to and longitudinally movable in suitable bearings in the machine-frame to which said drum is rigidly secured, a cross-head secured to said rods, a toggle or toggles applied to said cross-head, means to straighten and flex said toggle or toggles, springs inserted between collars on said rods and a rigid portion of the machine-frame, a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts supported so as to be movable toward and from each other, on which said number-wheels and platen-wheels are carried, means controlled by the movement of the printing-drum for imparting movement to said shafts toward and from each other to effect contact of said number-wheels and platen-wheels and means to regulate the approach of said shafts toward each other and for rotating said number-wheels and platen-wheels, a feed mechanism consisting of sectional feed-rolls and means for rotating said feed-rolls, a perforating cutter or cutters secured between sections of one of said feed-rolls and a groove or grooves adapted to receive said cutter or cutters formed in the opposed feed-roll, substantially as described.

4. In a machine of the type described, the combination of a printing-drum, means to impart a reciprocating movement thereto, said means comprising rods fitted to and longitudinally movable in bearings in the machine-frame to which said drum is rigidly secured, a cross-head secured to said rods, a toggle or toggles applied to said cross-head and means to straighten and flex said toggle or toggles, a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts supported so as to be movable toward and from each other on which said number-wheels and platen-wheels are carried, means controlled by the movement of the printing-drum for imparting movement to said shafts toward and from each other and for rotating said number-wheels and platen-wheels, a feed mechanism consisting of feed-rolls and means for rotating said feed-rolls, a reciprocating cross-knife and means to impart a reciprocating motion thereto, both said feed-rolls and the cross-knife being actuated through the medium of levers pivoted upon the machine-frame to which oscillatory movement is imparted by means of sleeves pivoted to a stud or crank-pin on a driven shaft to which one end of each of said levers is fitted, substantially as described.

5. In a machine of the type described the combination with intermittently-driven feed-rolls, of constantly-driven delivery-rolls, said delivery-rolls being driven through the medium of a friction, manually-operated means to rotate said delivery-rolls independently of said driving mechanism and a tension operating in combination with the feed-rolls to maintain the paper taut through the machine, substantially as described.

6. In a machine for operating on a web of paper the combination of feed-rolls and a reciprocating cross-knife, means to impart an intermittent rotary movement to said feed-rolls and to reciprocate said cross-knife, said means comprising a driven shaft, a crank thereon, a stud or crank-pin secured in said crank, levers pivoted upon the machine-frame, an end of each of which is fitted to a sleeve pivoted upon said crank-pin or stud and operative connection between one of said levers and the feed-rolls and between the other of said levers and the reciprocating cross-knife, substantially as described.

7. In a machine for operating on a web of paper the combination with feed-rolls of means to rotate the same, said means comprising a driven shaft, a crank thereon, a sleeve pivoted on a stud or crank-pin in said crank, a lever pivoted adjacent to said crank and fitted to said sleeve and operative connection between said lever and said feed-rolls, said means comprising a ratchet-wheel and a pawl adapted to engage the teeth thereof, substantially as described.

8. In a machine for operating on a web of paper the combination with feed-rolls of means to rotate the same, said means comprising a driven shaft, a crank thereon, a sleeve pivoted on a stud secured in said crank, a lever pivoted adjacent to said crank and fitted to said sleeve and operative connection between said lever and the feed-rolls, said connection comprising a ratchet-wheel and a pawl adapted to engage the teeth thereof and a brake applied to said feed-rolls, substantially as described.

9. In a machine for operating on a web of paper the combination with feed-rolls and a reciprocating cross-knife, of means to rotate said rolls and to reciprocate said cross-knife, said means comprising a driven shaft, a crank thereon, sleeves pivoted to a stud or crank-pin in said crank, pivoted levers fitted to and longitudinally movable in said sleeves, operative connection between one of said levers and the feed-rolls, said connection comprising a ratchet-wheel and pawl and operative connection between the other of said pivoted levers and said cross-knife, said connection comprising studs fitted to and longitudinally movable in bearings in the machine-frame and to which said cross-knife is secured, a revolubly shaft, gears thereon adapted to engage teeth in said studs and a link connecting said lever with a crank on said shaft, substantially as described.

10. The combination with a cross-knife of means to reciprocate the same, said means comprising a driven shaft, a crank thereon, a stud or crank-pin secured in said crank, a sleeve pivoted on said stud or crank-pin, a pivoted lever fitted to said sleeve, studs to which said cross-knife is secured, pivoted gears adapted to engage teeth formed in said studs and operative connection between said gears and said pivoted lever whereby oscillatory movement will be imparted to said gears, substantially as described.

11. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts movable toward and from each other on which said number-wheels and platens are carried, means controlled by the movement of the printing-drum for imparting movement to said shafts toward and from each other and means to rotate said shafts, substantially as described.

12. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, sleeves in which said shafts are revolubly mounted, studs on which said sleeves are longitudinally movable, levers pivoted to said sleeves, gear-teeth thereon which engage racks on the studs to which said sleeves are fitted, a pivoted lever or levers, links which connect said pivoted lever or levers with the levers pivoted upon the sleeves in which the number-wheel shafts are mounted and a link or links which connect said pivoted lever or levers with the housing of the printing-drum and means to rotate said number-wheel and platen shafts, substantially as described

13. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, sleeves in which said number-wheel and platen shafts are mounted, studs on which said sleeves are longitudinally movable, levers pivoted to said sleeves, gear-teeth thereon which engage

racks on said studs, a pivoted lever or levers, links which connect said pivoted lever or levers with the levers upon said sleeves and an adjustable link or links which connect said pivoted lever or levers with the bearing of the printing-drum and means to rotate said number-wheel and platen shafts, substantially as described.

14. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, sleeves in which said number-wheel and platen shafts are mounted, studs on which said sleeves are longitudinally movable, pivot-shafts mounted in said sleeves, levers secured to said pivot-shafts, gear-teeth thereon which engage racks formed on said studs, links which connect a lever on each of said shafts with a pivoted actuating-lever and a link which connects said actuating-lever with the bearing of the printing-drum and means to rotate said number-wheel and platen shafts, substantially as described.

15. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means controlled by the movement of the printing-drum to impart movement to said number-wheel and platen shafts toward and from each other and means to rotate said number-wheel shafts, said means comprising ratchet-wheels secured to said shafts, levers pivoted upon said shafts, pawls on said levers adapted to engage the teeth of said ratchet-wheels and means to impart oscillatory movement to said levers relatively to said number-wheel shafts, substantially as described.

16. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means controlled by the movement of the printing-drum to impart movement to said shafts toward and from each other and means to rotate said number-wheel shafts, said means comprising ratchet-wheels secured to said shafts, levers pivoted upon said shafts, pawls on said levers adapted to engage the teeth of said ratchet-wheels and links which connect said levers with a fixed support, substantially as described.

17. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means controlled by the movement of said drum to impart movement to said shafts toward and from each other, frictions applied to the number-wheel shafts and means to impart an intermittent movement to said shafts, substantially as described.

18. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising number-wheels and platens, shafts on which said number-wheels and platens are carried, means controlled by the movement of the printing-drum for imparting movement to said shafts toward and from each other, frictions applied to said shafts and means to rotate said shafts, said means comprising ratchet-wheels secured to said shafts and oscillating pawls adapted to engage the teeth thereof, substantially as described.

19. The combination with a printing-drum and means to impart a reciprocating movement thereto, of a numbering mechanism comprising opposed number-wheel and platens, shafts on which said number-wheels and platens are carried, means controlled by the movement of the printing-drum to impart movement to said shafts toward and from each other, frictions applied to said shafts and means to rotate said shafts, said means comprising ratchet-wheels adjustably secured to said shafts and oscillating pawls adapted to engage the teeth of said ratchet-wheels, substantially as described.

20. The combination with a printing-drum and means to impart a reciprocating movement thereto, of a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts on which said number-wheels and platen-wheels are carried, sleeves in which said number-wheel and platen-wheel shafts are mounted, studs on which said sleeves are longitudinally movable, pivot-shafts mounted in said sleeves, levers secured to said pivot-shafts, gear-teeth thereon which engage racks in said studs, a lever on each of said pivot-shafts, links which connect said levers with an actuating-lever and a link which connects said actuating-lever with the printing-drum or the bearing thereof, frictions applied to the number-wheel and platen-wheel shafts, ratchet-wheels adjustably secured to said shafts, levers pivoted upon said shafts, pawls on said levers adapted to engage the teeth of said ratchet-wheels and links which connect said levers with a rigid support, substantially as described.

21. The combination with a printing-drum and means to impart a reciprocating movement thereto, of a numbering mechanism comprising opposed number-wheels and platens, shafts movable toward and from each other on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other, means to rotate said number-wheel shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders, pads secured to the perimeters thereof, holes or openings in said ink-cylinders adapted for the delivery of ink from the interior of said cylinders to said pads, rods on which said ink-cylinders are supported so as to be revolvable, the relation of parts being such that the pads on said ink-fountains will be in contact with the number-wheels and means to maintain said ink-cylinders in engagement with said number-wheels, substantially as described.

22. The combination with a printing-drum and means to impart reciprocating movement thereto, of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, bearing-blocks, which are movable toward and from each other to which said shafts are mounted, means controlled by the movement of the printing-drum for imparting movement to said bearing-blocks toward and from each other, means to rotate said number-wheel shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders, pads secured to the perimeters of said ink-cylinders, holes or openings in said ink-cylinders adapted to deliver ink from the interiors of said cylinders to said pads, rods secured in arms on said number-wheel-shaft bearing-blocks, on which said ink-cylinders are supported, the relation of parts being such that the pads on said ink-cylinders will be in contact with said number-wheels and flanges on said ink-cylinders adapted to embrace the sides of said number-wheels, substantially as described.

23. The combination with a printing-drum and means to impart reciprocating movement thereto, of a numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, bearing-blocks which are movable toward and from each other in which said number-wheel and platen shafts are mounted, means controlled by the movement of the printing-drum for imparting movement to said bearing-blocks toward and from each other, means to rotate said shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders, pads secured to the perimeters thereof, holes or openings in said ink-cylinders adapted to deliver ink from the interiors of said cylinders to said pads, rods secured in arms on said number-wheel-shaft bearing-blocks on which said ink-cylinders are supported, the relation of parts being such that the pads on said ink-cylinders will be in contact with said number-wheels, springs applied to said rods and adapted to maintain said ink-cylinders yieldingly in contact with said number-wheels and flanges on said ink-cylinders adapted to embrace the sides of said number-wheels, substantially as described.

24. The combination with a printing-drum and means to impart a reciprocating movement thereto of a numbering mechanism comprising opposed number-wheels and platen-wheels, shafts on which said number-wheels and platen-wheels are carried and on which they are longitudinally adjustable, means controlled by the movement of the printing-drum to impart movement to said shafts toward and from each other and means to rotate said shafts, substantially as described.

25. A numbering mechanism comprising opposed number-wheels and platens, shafts movable toward and from each other on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other and means to rotate said shafts, substantially as described.

26. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, sleeves in which said shafts are mounted, studs on which said sleeves are longitudinally movable, levers pivoted to said sleeves, gear-teeth thereon which engage racks on said studs, a pivoted actuating lever or levers, links which connect said levers so pivoted upon said sleeves with said actuating lever or levers, means to impart an oscillating movement to said actuating-levers and means to rotate said number-wheel shafts, substantially as described.

27. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, sleeves in which said shafts are mounted, studs on which said sleeves are longitudinally movable, levers pivoted to said sleeves, gear-teeth thereon which engage racks on said studs, a pivoted actuating lever or levers, links which connect said levers so pivoted upon said sleeves with said actuating lever or levers, means to impart an oscillating movement to said actuating lever or levers, means to adjust the approach of said number-wheels and platens toward each other and means to rotate said number-wheel shafts, substantially as described.

28. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, sleeves in which said shafts are mounted, studs on which said sleeves are longitudinally movable, pivot-shafts mounted in said sleeves, levers secured to said pivot-shafts, gear-teeth thereon which engage racks formed on said studs, links which connect a lever on each of said pivot-shafts with a pivoted actuating-lever, means to impart an oscillating movement to said actuating-lever and means to rotate said number-wheel shafts, substantially as described.

29. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other and means to rotate said shafts, said means comprising ratchet-wheels secured to said shafts, levers pivoted upon said number-wheel shafts, pawls on said levers adapted to engage the teeth of said ratchet-wheels and means to oscillate said levers relatively to said number-wheel shaft, substantially as described.

30. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other and means to rotate said number-wheel shafts, said means comprising ratchet-wheels secured to said shafts, levers pivoted upon said shafts, pawls on said levers adapted to engage the teeth of said ratchet-wheels and links which connect said levers with a fixed support, substantially as described.

31. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels are carried, means to impart movement to said shafts toward and from each other, a friction applied to the number-wheel shaft and means to impart rotary movement thereto, substantially as described.

32. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other, frictions applied to said shafts and means to rotate said shafts, said means comprising ratchet-wheels secured to said shafts and oscillating pawls adapted to engage the teeth of said ratchet-wheels, substantially as described.

33. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other, frictions applied to said shafts and means to rotate said shafts, said means comprising ratchet-wheels adjustably secured to said shafts and oscillating pawls adapted to engage the teeth of said ratchet-wheels, substantially as described.

34. A numbering mechanism comprising opposed number-wheels and platen-wheels, shafts on which said number-wheels and platen-wheels are carried, sleeves in which said number-wheel and platen-wheel shafts are mounted, studs on which said sleeves are longitudinally movable, pivot-shafts mounted in said sleeves, levers secured to said pivot-shafts, gear-teeth thereon which engage racks on said studs, a lever on each of said pivot-shafts, links which connect said levers with an actuating-lever, means to impart an oscillating movement to said actuating-lever, frictions applied to said number-wheel and platen-wheel shafts, ratchet-wheels adjustably secured to said shafts, levers pivoted upon said shafts, pawls on said levers adapted to engage the teeth of said ratchet-wheels and links which connect said levers with a fixed support, substantially as described.

35. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other, means to rotate said number-wheel shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders, pads secured to the perimeters thereof, holes or openings in said ink-cylinders adapted for the delivery of ink from the interiors of said cylinders to said pads, rods on which said ink-cylinders are supported so as to be revolvable and means to maintain said ink-cylinders in engagement with said number-wheels, substantially as described.

36. A numbering mechanism comprising opposed number-wheels and platens, means to impart relative movement to said number-wheels and platens toward and from each other, means to rotate said number-wheels and means to apply ink thereto, said means comprising revolvable hollow ink-cylinders, pads secured to the perimeters of said ink-cylinders, holes or openings in said ink-cylinders adapted for the delivery of ink from the interiors of said cylinders to said pads and means to maintain said ink-cylinders in contact with said number-wheels, substantially as described.

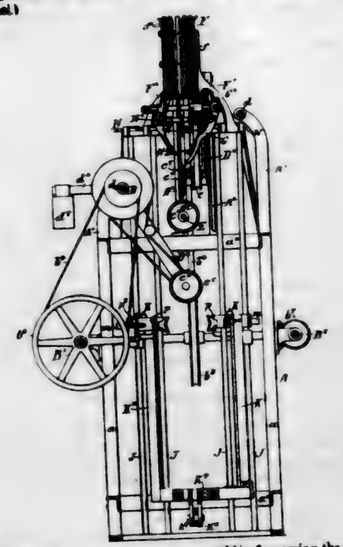
37. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, means to impart movement to said shafts toward and from each other, means to rotate said shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders revolubly supported with their perimeters in contact with said number-wheels, pads secured to the perimeters of said ink-cylinders, holes or openings in said ink-cylinders adapted for the delivery of ink from the interiors of said cylinders to said pads and means to maintain said ink-cylinders in contact with said number-wheels, substantially as described.

38. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, bearing-blocks which are movable toward and from each other to which said shafts are mounted, means to impart movement to said bearing-blocks toward and from each other, means to rotate said number-wheel shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders, pads secured to the perimeters thereof, holes or openings in said ink-cylinders adapted to deliver ink from the interiors of said cylinders to said pads, rods secured in arms on said number-wheel-shaft bearing-blocks on which said ink-cylinders are supported and flanges on said ink-cylinders which embrace the sides of said number-wheel shafts, substantially as described.

39. A numbering mechanism comprising opposed number-wheels and platens, shafts on which said number-wheels and platens are carried, bearing-blocks in which said number-wheel and platen shafts are mounted, means to impart movement to said bearing-blocks toward and from each other, means to rotate said shafts and means to apply ink to said number-wheels, said means comprising hollow ink-cylinders, pads secured to the perimeters thereof, holes or openings in said ink-cylinders adapted to deliver ink from the interiors of said cylinders to said pads, rods secured in arms on said number-wheel-shaft bearing-blocks on which said ink-cylinders are revolubly supported, springs applied to said rods and adapted to maintain said ink-cylinders yieldingly in contact with said number-wheels and flanges on said ink-cylinders adapted to embrace the sides of said number-wheels, substantially as described.

40. In a machine for operating on a web of paper, the combination with feed-rolls, means to rotate the same and a reciprocating cross-knife, of a support beneath said cross-knife and fingers on said cross-knife which deliver the sheets of paper severed by said cross-knife to said support, substantially as described.

709,811. MACHINE FOR CUTTING COCOANUTS. FRANKLIN BAKER, Jr., and EDWARD J. FRITSCH, Philadelphia, Pa.; said Fritsch assignor to said Baker. Filed Oct. 20, 1900. Serial No. 34,093. (No model.)



Claim.—1. The combination in a machine for sawing the shells of cocoanuts, of a number of saws placed one before the other along the line of motion of a cocoanut through the machine, means for gripping the cocoanut and causing different portions of its surface to pass successively into contact with said saws, substantially as described.

2. The combination in a machine for sawing the shells of a cocoanut, of a number of saws arranged one before the other along the line of motion of the cocoanuts through the machine so that they will operate successively upon a cocoanut passed before them, and a carrier for moving the cocoanuts successively in the paths of the saws and causing different portions of their surfaces to contact successively with said saws, with means for limiting the depth of the cut of said saws, substantially as described.

3. The combination in a cocoanut-shell-cutting machine, of saws carried by yielding bearings, said saws having their axes placed in different but parallel planes, a hopper and means for gripping the cocoanut and carrying it from the hopper past the saws, said saws being arranged to contact successively with different portions of the surface of a cocoanut-shell, substantially as described.

4. The combination of saws mounted on yielding bearings, means for driving the saws, a hopper having yielding side members movable parallel to themselves, whereby the hopper is made to accommodate different sizes of cocoanuts, with means for gripping the cocoanuts and carrying them from the hopper past the saws, substantially as described.

5. The combination in a cocoanut-cutting machine, of saws and gripping mechanism for holding the cocoanut during its passage through the machine, said mechanism including spring-plungers movable in lines at right angles to the line of motion of the cocoanuts through the machine, with means for operating the same, substantially as described.

6. The combination in a machine for cutting cocoanuts, of a hopper, series of saws mounted on yielding bearings, said saws being arranged successively and around the line of motion of the cocoanut through the machine, with carriers for moving the cocoanuts successively from the hopper past the saws, substantially as described.

7. The combination in a machine for sawing cocoanuts, of a hopper, saws for cutting the shell of a cocoanut, carriers for moving the cocoanuts from the hopper past the saws, a set of fingers constructed to retain the cocoanuts in the hopper until one is gripped by the carriers, and a second set of fingers constructed to act at a level different from the first set to retain successive cocoanuts within the hopper, while the first set of fingers is open to permit the removal of a cocoanut by the carriers, substantially as described.

8. The combination in a machine for sawing cocoanuts, of a hopper, two sets of fingers directly under the hopper, means for moving one set of fingers toward the center line of the hopper, while the other fingers are moved out from the central line, saws for severing the shell of the cocoanut arranged under the fingers, and carriers having jaws for gripping the cocoanut and carrying it from the hopper past the saws, substantially as described.

9. The combination of a hopper, a series of saws, carriers for the cocoanuts, each carrier having movable jaws, springs for projecting the jaws, detents for holding the jaws in the projected and in the retracted position, and stops for releasing the detents, substantially as and for the purpose set forth.

10. The combination of a hopper, saws, carriers for the cocoanuts, each carrier having jaws, springs for projecting the jaws, two cam-shaped detents, arms on the detents, springs for holding the detents in position, means for operating one of the detents at the end of the upstroke, means for operating the other detent at the end of the downstroke, and a cam for withdrawing the jaws, substantially as described.

11. The combination of a hopper, saws mounted in the hopper, carriers for carrying the cocoanuts from the hopper past the saws, each carrier having a jaw movable toward and from the center of the machine, springs for moving the jaws out toward the center of the machine, two detents, one for retaining the jaw in the projected position and one for retaining the jaw in its retracted position, a pin mounted above one of said detents, a plate, an arm attached to the plate and controlled by the cocoanut, an opening in the plate in line with the pin on the carrier when the cocoanut is not in position, a cam for retracting the jaw, and a stop for releasing the jaw prior to the action of the cam so as to release the cocoanut, substantially as described.

709,812. **DENTAL MOUTH-MIRROR.** GEORGE S. BENNETT and JOSEPH W. THATCHER, San Francisco, Cal.; said Bennett assignor, by direct and mesne assignments, to said Thatcher and August Meyenborg, San Francisco, Cal. Filed Aug. 31, 1901. Serial No. 73,986. (No model.)

Claim.—In a dental mouth-mirror, the combination of the metallic casing, a mirror carried thereby, a resistance-coil within said casing, a lining of insulating material entirely surrounding said resistance-coil, a tubular stem secured to said casing and provided with an internal insulating-sleeve, a metallic tube arranged within said sleeve, and having one of its ends electrically connected to a terminal of the coil, an insulating-tube arranged within said metallic tube, an insulating-handle secured to the tubular stem, a conductor extending through the handle and insulating-tube and connected to the opposite terminal of the coil, a conducting-plug carried by the handle, a conducting-wire electrically connected thereto, a spring-conductor secured to said plug and adapted to be moved into contact with the said metallic tube to complete the circuit, and a push-button carried by said spring and extending through an opening in the handle, substantially as specified.

709,818. **WASHING-MACHINE.** ANDREW G. BRANDT, Scranton, and DAVID L. GRIFFITHS, Olyphant, Pa.; said Brandt assignor to said Griffiths. Filed Feb. 12, 1902. Serial No. 93,734. (No model.)

Claim.—1. A washing-machine comprising a body having a lid or cover, a rotary lower rubber provided with a shaft or stem, an upper shaft mounted on the lid or cover and provided with means for connecting it with the shaft of the lower rubber, said shafts being adapted to be coupled and uncoupled as the lid or cover is opened and closed, and an upper vertically-movable rubber mounted on the lid or cover and held against rotation, substantially as described.

2. A washing-machine comprising a washing-machine body having a lid or cover, a lower rubber arranged within the body and capable of rotation and provided with a shaft or stem, an operating-shaft mounted on the lid or cover and detachably engaging the shaft or stem, an upper vertically-movable rubber, and a yoke supporting the vertically-movable rubber and holding the same against rotation and extending through the lid or cover, substantially as described.

3. A washing-machine comprising a body provided with a lid or cover, a lower rubber journaled on the body at the bottom thereof and provided with a stem or shaft, an operating-shaft provided with a socket receiving the stem or shaft of the lower rubber, a bearing-bracket mounted on the cover and supporting the shaft, an upper rubber having an opening receiving the operating-shaft and the lower stem or shaft, and a yoke slidably arranged on the operating-shaft and supporting the upper rubber and extending through slots of the cover or lid, substantially as described.

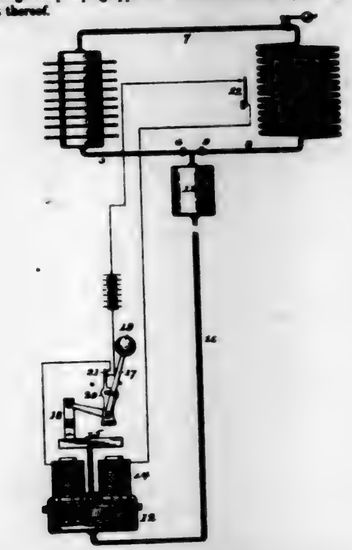
4. A washing-machine comprising a washing-machine body having a lid or cover provided with slots, a plate mounted on the lid or cover and provided at the said slots with recesses and having a bearing-opening, a bearing-bracket mounted on the lid or cover, a lower rotary rubber having a shaft or stem, an upper operating-shaft arranged in the opening of the plate and in an opening of the bearing-bracket and provided with a socket receiving the shaft or stem, said operating-shaft being also provided with a supporting-shoulder, a yoke supported by the shoulder of the operating-shaft and extending through the slots of the cover and the recesses of the plate, and an upper non-rotatable rubber supported by the yoke, substantially as described.

709,814. **REFRIGERATING APPARATUS.** CLYDE J. COLEMAN, Chicago, Ill., assignor, by mesne assignments, to Clarence W. Coleman. Filed Oct. 14, 1899. Serial No. 733,696. (No model.)

Claim.—1. In a refrigerating apparatus, the combination with a condenser and a cooling-chamber, of a static-column conduit containing a liquid column constituting a piston at its upper end, valved conduits connecting the top of the static-column conduit with the condenser and cooling-chamber, and an electrically-operated pumping apparatus containing a piston or diaphragm arranged to press directly upon the liquid column at the lower portion thereof.

2. In a refrigerating apparatus, the combination with a condenser and a cooling-chamber, of a static-column conduit containing a liquid column constituting a piston at its upper end, valved conduits connecting the top of the static-column conduit with the condenser and the cooling-chamber, an electromagnetic pumping apparatus containing a piston or diaphragm arranged to press directly upon the liquid column at the lower portion thereof, and a thermostat arranged within the influence of the cooling-chamber and connected to the electromagnetic pumping apparatus so as to control the operating electric current thereof.

3. In a refrigerating apparatus, the combination with a condenser and a cooling-chamber, of a static-column conduit containing a liquid column constituting a piston at its upper end, valved conduits connecting the top of the static-column conduit with the condenser and with the cooling-chamber, an electromagnetic pumping apparatus containing a piston or diaphragm arranged to press directly upon the liquid column at the lower end thereof, an automatically-operated circuit make and break device controlling such electromagnetic pumping apparatus, and a thermostat arranged within the influence of the cooling-chamber and connected to the electromagnetic pumping apparatus so as to control the operating electric current thereof.



709,815. **PIPE-HANGER.** HARRY S. COLLINS, Pittsburg, Pa., assignor to Collins Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 15, 1902. Serial No. 94,304. (No model.)

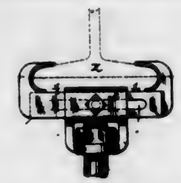
Claim.—1. A pipe-hanger comprising two straps, the lower ends of which are pivotally connected and the upper ends having hooks or projections, a ring or collar having pockets in opposite sides thereof adapted to be brought into alinement with the hooks or projections on said straps and in which recesses said hooks are adapted to be seated, an interiorly-threaded nut loosely fitting in said ring or collar having a flange of greater diameter than the opening in said ring, and laterally-projecting abutments adapted to be brought into alinement with and close the top of said pockets.

2. In a pipe-hanger, the combination of a stirrup, comprising two straps pivotally connected at their lower ends and provided with projections near their upper ends, a collar having pockets in opposite sides thereof adapted to receive the projections on said straps, a nut having a flange of greater diameter than the opening in said collar, an adjacent cylindrical surface fitting loosely in said opening, and laterally-projecting abutments adapted to be brought into alinement with and close the top of said pockets and prevent the projections on said straps from being lifted thereout.

709,816. **BEAM-CLAMP.** HARRY S. COLLINS, Pittsburg, Pa., assignor to Collins Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 15, 1902. Serial No. 94,305. (No model.)

Claim.—An adjustable beam-clamp comprising two similar horizontally-disposed members having hooked portions and provided with longitudinally-disposed slots, a separable thimble in which said horizontal members are movably secured, and a screw-bolt projecting through said thimble and the slots of said horizontal members, whereby said members may be held stationary.

709,816.

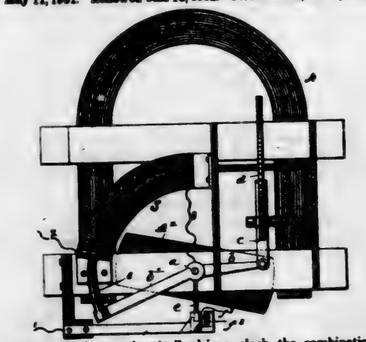


709,817. **ELECTROLYTICALLY TREATING ORES.** CLIFTON R. DOLBEAR, Boston, Mass., assignor to American Mining and Metal Extraction Company, Boston, Mass. Filed June 8, 1901. Serial No. 62,309. (No specimens.)

Claim.—1. The method of reducing metals from their ores, which consists in dissolving the crushed ores in a nitrate of the suitable metal, adding to the mixture thus formed sulfuric acid, and subjecting the solution to the action of an electric current, whereby the metal is plated out of the solution, substantially as described.

2. The method of reducing metals from their ores, which consists in dissolving the crushed ore in a compound containing a nitric acid radical, adding to the mixture sulfuric acid, and subjecting the resultant compound to the action of an electric current, substantially as described.

709,818. **ELECTRIC CLOCK.** NEWTON HARRISON, New York, N. Y., assignor of one-half to William Henry Laird, New York, N. Y. Filed May 11, 1901. Renewed Jan. 18, 1902. Serial No. 90,283. (No model.)



Claim.—1. In an electrically-driven clock, the combination with the clock-train, of two magnets, one of which is a permanent magnet and the other an electromagnet, the permanent magnet being adapted to act first upon the train through a limited movement, and the electromagnet adapted to act at the end of such movement to restore the permanent magnet to the beginning of its working position.

2. In an electrically-driven clock, the combination with the clock-train, of a permanent magnet having a pivoted armature adapted to engage the train, and an electromagnet, the permanent magnet being adapted to act independently on its armature to drive the clock through a limited stroke, and the electromagnet being adapted to restore the armature to the beginning of its stroke after each completion thereof, substantially as described.

3. In an electrically-driven clock, the combination with the clock-train of a permanent magnet having a pivoted armature adapted to engage the train and an electromagnet adapted to move the armature, the permanent magnet acting independently of the electromagnet to move the train through a limited stroke, and a switch adapted to close the circuit of the electromagnet at the end of the stroke of the armature, substantially as described.

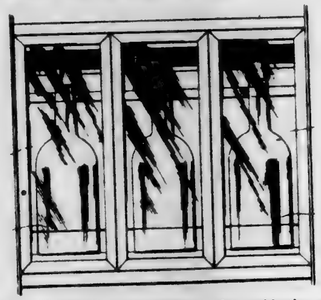
4. In an electrically-driven clock, the combination with the clock-train of a permanent magnet having a pivoted armature adapted to engage the train and an electromagnet adapted to move the armature, the permanent magnet acting independently of the electromagnet to move the train through a limited stroke, and a switch adapted to close the circuit of the electromagnet at the end of the stroke of the armature and hold it closed for a prolonged period.

5. In a clock, a permanent magnet movably mounted and connected to the train, a second permanent magnet having its poles opposed to those of the first and within the influence thereof, whereby the combined action of the two permanent magnets will drive the clock.

6. In an electrically-driven clock, the combination with the clock-train of two magnets, one of which is adapted to act independently of the other to drive the clock-train, and the second of which acts upon the first at regular intervals to restore it to the beginning of its working position.

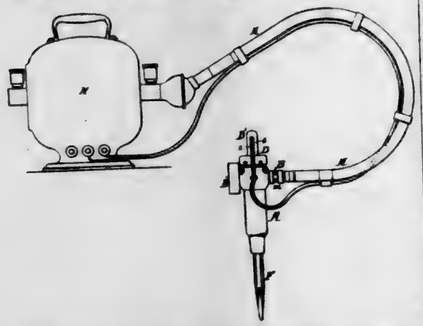
7. In an electric clock, the combination of the clock-gearing, an electromagnet and a circuit-controller consisting of a movable contact and two fixed contacts arranged in the path of movement of the movable contact, one of said two contacts having insulation on one side against which the movable contact normally bears and means whereby the movable contact will first be carried onto the naked face of the insulated contact to maintain the closure, substantially as described.

709,819. **BOTTLE-STOPPER.** JOHN T. HIGER, Boston, Mass. Filed Oct. 31, 1901. Serial No. 80,632. (No model.)



Claim.—A bottle-stopper consisting in the combination with a stationary block of rubber secured to some suitable support, of a bottle-support located vertically opposite to the rubber, said support having an inclined surface at an angle to the axis of the bottle when the latter is in its normal position, and upon which incline the bottom of the bottle rises for the purpose of causing the mouth of the bottle to be tightly closed by the rubber, and a notched guide that engages and keeps the bottle-neck in position.

709,820. **POWER-HAMMER.** JAMES H. JACKSON, Denver, Colo., assignor of one-fourth to Frederic Schoff, Philadelphia, Pa. Filed Feb. 9, 1901. Serial No. 46,688. (No model.)



Claim.—1. The combination in a power-hammer, of a casing, a crank-shaft mounted in bearings therein, a tool carried by the opposite end of the casing, a hammer within the casing, a connecting-rod on the crank of the shaft and loosely connected to the hammer whereby the blow of the hammer depends entirely upon momentum, substantially as described.

2. The combination in a power-hammer, of a casing, a tool carried by said casing, means in the casing for striking said tool, a shaft for operating said means, an electric motor, a flexible shaft connecting the motor with the operating-shaft, means on the tool for making and breaking an electric circuit, and wires extending from the said means on the tool to the electric motor, substantially as described.

3. The combination in a power-hammer, of a casing, a hammer within the casing, a crank-shaft, means for connecting the crank-shaft to the hammer, a handle for the tool, a device carried by the handle for making and breaking an electric circuit, an electric motor, a flexible shaft connecting the electric motor with the crank-shaft of the tool, and wires extending from the circuit making and breaking device on the handle of the tool to the electric motor, substantially as described.

4. The combination in a power-hammer, of a casing, a handle flexibly connected thereto, a hammer within the casing, a crank-shaft extending through the casing, a rod connecting the crank-shaft to the hammer, a flexible shaft coupled to the crank-shaft, an electric motor coupled to the flexible shaft, a circuit-breaker carried by the handle, and wires extending from the circuit-breaker to the electric motor, substantially as described.

5. The combination in a power-hammer, of a casing, a tool carried by said casing, a floating hammer within the casing and arranged to strike the tool, a crank-shaft mounted in bearings in the casing, a rod connecting the crank-shaft to the hammer, a plunger mounted within the hammer and bearing against the end of the rod, and a spring mounted between the plunger and the hammer, substantially as described.

6. The combination of a casing, a crank-shaft mounted in said casing, a floating hammer in the casing, a plunger within the hammer, a flexible connection between the plunger and the hammer, a rod connected to the crank of the shaft and slotted at the opposite end, and a pin on the hammer passing through the slot in the rod, substantially as described.

7. The combination of a casing, a crank-shaft mounted therein, a floating hammer within the casing, a plunger, a spring between the plunger and the hammer, a rod connecting the plunger and the crank of the shaft, a tool extending through the end of the casing, and a spring tending to force the tool out, the end of said tool being in position to be struck by the hammer, substantially as described.

8. The combination of a casing, a crank-shaft, a floating hammer, a plunger, a rod connecting the plunger with the crank of the shaft, a spring mounted between the plunger and the hammer, a tool projecting into the casing into position to be struck by the hammer, and a handled cap at the rear of the casing, substantially as described.

9. The combination of a casing, a crank-shaft, a floating hammer, a plunger, a rod connecting the plunger with the crank of the shaft, a spring mounted between the plunger and the hammer, a tool projecting into the casing in position to be struck by the hammer, a handled cap at the rear of the casing, and a spring mounted between the rear of the casing and the cap, substantially as described.

10. The combination of a slotted casing, bushings in the slot, blocks back of the bushings, means for securing the blocks to the casing, a crank-shaft mounted in the bushings, a floating hammer, means for connecting the hammer to the crank-shaft, and a tool carried by the opposite end of the casing, substantially as described.

11. The combination of a casing, a tool in one end of the casing, a floating hammer, a crank-shaft, a plunger within the floating hammer and connected to the crank of the shaft, an electric motor coupled to the said crank-shaft, a handle attached to the casing, a device in the handle for making or breaking the motor-circuit, and wires extending from the handle to the motor, substantially as described.

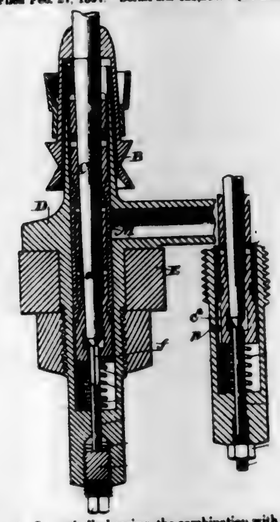
12. The combination of a casing, a crank-shaft mounted in the casing, a floating hammer, a plunger within the hammer, a spring mounted between the end of the plunger and the hammer, a tool projecting into the casing in position to be struck by the hammer, a rod connecting the crank-shaft with the plunger, a handled cap at the rear of the casing, a spring between the cap and the rear of the casing, a tube mounted in the handle, and a push-button device for making and breaking the electric circuit to start and stop the driving mechanism of the hammer, substantially as described.

13. The combination of a casing, a tool carried by one end of the casing, a handle secured to the opposite end of the casing, a fly-wheel mounted on one end of the crank-shaft, the opposite end of the crank-shaft being arranged to be coupled to a flexible shaft, a hammer within the casing arranged to strike the tool, and a connecting-rod mounted on the crank of the shaft and loosely connected to the hammer, substantially as described.

14. The combination in a power-hammer, of a casing, a tool mounted in one end of the casing, a handle yieldingly connected to the opposite end of the casing, an electric circuit-breaker within the handle, a crank-shaft mounted in bearings in the casing, a fly-wheel on said crank-shaft, a hammer mounted within the casing and arranged to strike the tool, a rod mounted on the crank of the shaft and connected loosely to the hammer, and a spring between the end of the rod and the hammer, substantially as described.

15. In a power-hammer, the combination, of the flexible shaft connecting the motor with the tool having wires extending from the handle of the tool to the motor; with the tool, consisting of the casing, the hammer operating within the casing, the shaft, means for connecting the shaft to the hammer, the handle for the tool, the controlling device provided in the handle for connecting and breaking the electric circuit, substantially as specified.

709,821. **SPINDLE-BEARING.** JOHN KILBURN, Belmont, Mass., assignor to the Sawyer Spindle Company, of Maine, a Corporation of Maine. Filed Feb. 27, 1897. Serial No. 626,287. (No model.)



Claim.—1. In a spindle-bearing, the combination with a bolster-case having an interiorly smooth aperture in its base, of a step-pintle tightly fitted in said aperture, a tapered spindle-pintle, a bolster provided with a tapered bearing for the spindle-pintle, and with an aperture in its base to receive the step-pintle, and means for yieldingly supporting said bolster in said bolster-case independently of, and so as to be capable of freely moving vertically with relation to, the step-pintle, substantially as described.

2. In a spindle-bearing, the combination with a bolster-case having an interiorly smooth aperture in its base, of a step-pintle tightly fitted in said aperture and projected through the bottom of the bolster-case, a tapered spindle-pintle, a bolster provided with a tapered bearing for the spindle-pintle and with an aperture in its base to receive the step-pintle, and means for yieldingly supporting said bolster independently of, and so as to be capable of freely moving vertically with relation to, the step-pintle, substantially as described.

3. In a spindle-bearing, the combination with a spring-supported bolster having an aperture in its lower end, of a step-pintle free to reciprocate in said aperture, and means to adjust said step-pintle extending below and outside of the bolster-case, substantially as described.

4. In a spindle-bearing the combination with a spring-supported bolster provided with an aperture in its lower end, of a step-pintle projecting into said aperture, and means engaging said step-pintle to guide said bolster as it moves downwardly thereon against the tension of its spring-support, substantially as described.

5. In a spindle-bearing, the combination with a tapered spindle-pintle, a bolster provided with a tapered bearing therefor and a bolster-case, of a step-pintle fitted with a driving-fit in the lower end of the bolster-case to prevent the escape of oil therethrough and to hold said pintle in adjusted position, said step-pintle being projected beyond the end of the bolster-case, an adjusting device carried by said projecting end and means for yieldingly supporting said bolster independently of the step-pintle, substantially as described.

6. In a spindle-bearing the combination with the bolster, step-pintle and stop carried by said step-pintle, of a spring surrounding said step-pintle, and a flanged tube free to move along said step-pintle and interposed between said spring and bolster, substantially as described

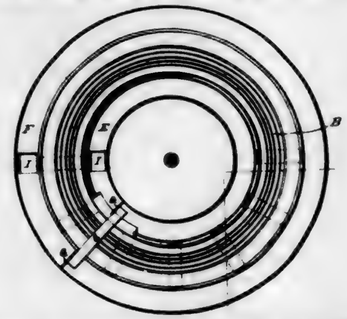
7. In a spindle-bearing, the combination with the bolster-case, spring, bolster supported by said spring, and step, of means projected through the bottom of the bolster-case to adjust the relative longitudinal positions of the bolster and step, to adjust the tension of the spring, substantially as described.

8. In a spindle-bearing, the combination with a bolster-case having an interiorly smooth aperture in its base, of a step-pintle tightly fitted in said aperture capable of vertical movement therein, and having a polygonal upper end, a bolster loosely supported in said case, said bolster having a polygonal aperture in its lower end loosely engaging the upper end of said pintle and capable of vertical movement thereon, substantially as described.

9. In a spindle-bearing, the combination with a bolster-case, of a tapered spindle-pintle, a step-pintle supported by the bolster-case, a bolster provided with a tapered bearing for the spindle-pintle having an aperture in its lower end to receive the step-pintle, and means for yieldingly supporting said bolster independently of the step-pintle and so as to be capable of freely moving vertically with relation to said step-pintle, substantially as described.

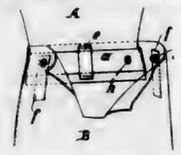
10. In a spindle-bearing, the combination with a bolster-case having an interiorly smooth aperture in its base, of a step-pintle tightly fitted in said aperture, a loosely-supported bolster located in the bolster-case provided with an aperture in its base to loosely receive the upper end of the step-pintle, a yielding support for the bolster independent of the step-pintle capable of freely moving vertically in the bolster-case and permitting the bolster freely to move vertically with relation to the step-pintle, substantially as described.

709,822. **ORE-CRUSHING MACHINE.** CHARLES C. LANE, Los Angeles, Cal. Filed Nov. 18, 1899. Serial No. 737,518. (No model.)



Claim.—An ore-crusher comprising a revolving frame; revolving crushing-rolls mounted in said frame; a tread for said rolls composed of a plurality of concentric rings, having spaces therebetween; supports for said rings; screens below the tread, adapted to deflect the crushed ore into the troughs at the side of and below the tread; arms affixed to the revolving frame, having scrapers on the bottom thereof adapted to work in said troughs.

709,828. **SKIRT-HOLDER OR SKIRT-SUSPENDER.** WILHELMINE MEHLFELD, Barmen, Germany, assignor to Philipp Barthels, Barmen, Germany. Filed Mar. 11, 1902. Serial No. 97,751. (No model.)



Claim.—A belt *a* provided with eyelets *h* and with detachable strips *i* parallel with said belt, each strip being divided into sections adapted to form respectively loops *c* and straps *f* having studs *g*, the said studs serving in the first instance to hold the said strips to the belt and the said loops and straps being adapted to hold respectively an upper and a lower garment to said belt after they have been sewed on the said garments and the belt has been passed through the loops and the studs have been pressed into the eyelets substantially as described.

709,824. **EYEGLASSES.** EDWARD H. SCHELD, Baltimore, Md. Filed Apr. 9, 1902. Serial No. 102,054. (Model.)

Claim.—1. In combination with a pair of lenses and a bridge connecting the same, of a pair of nose-guards, each being supported at one

end and having its other end free and provided with a nose-engaging part extending inward past the bridge, a portion of the body of the guard lying in front of the bridge and forming a spring to normally press said nose-engaging part toward the nose-engaging part carried by the other guard.

2. In combination with a pair of lenses and a bridge connecting the same, of a pair of nose-guards, each being supported at one end and having its other end free and provided with a nose-engaging part extending inward past the bridge, a portion of the body of the guard lying in front of the bridge and forming a spring to normally press said arms toward the pair carried by the other guard, and a handle attached to each guard in front of the bridge.

3. In combination with a pair of lenses and a connecting nose-bridge, of a pair of nose-guards, each being rigidly supported at one end adjacent to the lens-mounting and having its other end free said provided with diverging arms straddling the bridge and extending inward and provided with bearing-tips, the body portion of each guard between its point of attachment and said arms being resilient and serving to normally press the bearing-tips of one guard toward those of the other guard, and a handle or finger-piece carried by each guard in front of the lenses and bridge.

4. In combination with a pair of lenses and a connecting nose-bridge, of a pair of nose-guards each constructed of a single piece of metal having one end formed into two diverging arms and its other end into an eye, the body portion between the eye and the arms being formed into a spring and each guard being provided with a handle.

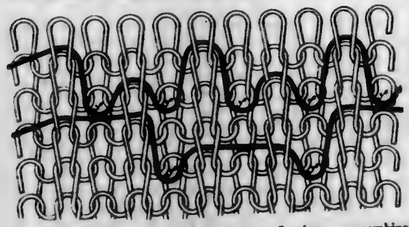
5. In combination, a pair of lenses, a connecting nose-bridge, a nose-guard attached rigidly at each end of the bridge and provided with a pair of arms diverging and extending inward and straddling the bridge, the body portion of the guard between its point of attachment and the arms being coiled into a spring, a handle or finger-piece attached to each guard in front of the bridge and lenses.

6. In combination with a pair of lenses and a connecting nose-bridge, of a nose-guard attached at each end of the bridge and having its free end provided with a nose-engaging part extending beyond the bridge, the body of the guard in front of the bridge being coiled into a spring, and a finger-piece attached to the inner end of the spring and working through a slot in the body of the coil.

7. The combination with a pair of lenses and a connecting nose-bridge, of a pair of nose-guards, each being rigidly supported at one end adjacent to the lens-mounting and having its other end free and provided with a nose-engaging part extending inward past the bridge, the body portion of each guard between its point of attachment and the bearing-tips of the nose-engaging part being resilient and serving to normally press the bearing-tips of one guard toward those of the other guard, and a handle or finger-piece carried by each guard in front of the lenses and bridge.

8. The combination with a pair of lenses and a connecting nose-bridge, of a pair of nose-guards, each being supported at one end adjacent to the lens-mounting and having its other end free and provided with a nose-engaging part, the body portion of each guard between its point of attachment and the bearing-tips of the nose-engaging part being coiled into a convolute spring the tendency of which is to normally press one nose-engaging part toward the other, and a handle or finger-piece carried by each guard in front of the lenses and bridge.

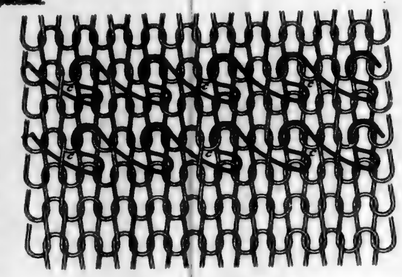
709,825. **KNITTED FABRIC.** ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Feb. 10, 1902. Serial No. 93,231. (No specimens.)



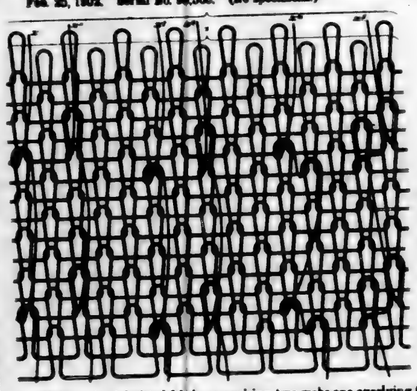
Claim.—A ribbed knitted fabric having a fleecing-yarn combined therewith and engaging first a wale, or wales, in one course, and then a wale or wales, in another course of the fabric, thereby providing a zig-zag disposition of the points of attachment of said fleecing-yarn, substantially as specified.

709,826. **RIBBED KNITTED FABRIC.** ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Feb. 19, 1902. Serial No. 94,761. (No specimens.)

Claim.—A ribbed knitted fabric having a fleecing-yarn laid in between stitches of one course of the fabric and projected so as to form loops between the stitches of an adjoining course of the fabric, whereby it is caused to pass around the sinker-wales of the fabric, substantially as specified.



709,827. **KNITTED FABRIC.** ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Feb. 25, 1902. Serial No. 96,505. (No specimens.)



Claim.—1. A knitted fabric comprising two webs one overlying the other, said webs being held together by a knitting yarn or yarns independent of those of which the webs are composed, substantially as specified.

2. A knitted fabric comprising two webs one overlying the other, said webs being held together by yarn or yarns independent of those of which the webs are composed, and engaging with wales of the two webs alternately, substantially as specified.

3. A knitted fabric comprising two webs one overlying the other said webs being held together by yarn or yarns independent of those composing the webs and forming loops or stitches in wales of the webs alternately, substantially as specified.

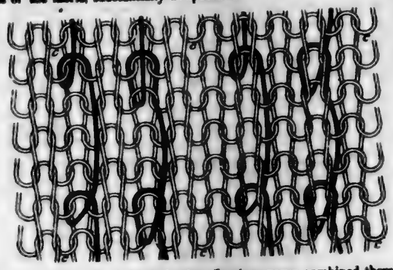
4. A knitted fabric comprising two webs one overlying the other, said webs being held together by yarn or yarns independent of those composing the webs, forming loops or stitches in wales of the webs alternately, and floating from each group of loops or stitches to the next, substantially as specified.

5. A knitted fabric comprising two webs, one overlying the other, said webs being held together by yarn or yarns independent of those of which the webs are composed, the tying yarn or yarns extending in the direction of the courses of stitches of the knitted webs, and engaging with wales of the two webs alternately, substantially as specified.

6. A knitted fabric comprising two webs, one overlying the other, said webs being held together by yarn or yarns independent of those composing the webs, said tying yarn or yarns extending in the direction of the courses of stitches of the knitted webs, forming loops or stitches in wales of the webs alternately, and floating from each group of loops or stitches to the next, substantially as specified.

709,828. **RIBBED KNITTED FABRIC.** ROBERT W. SCOTT, Philadelphia, Pa., assignor of one half to Louis H. D. Williams, Ashbourne, Pa. Filed Feb. 26, 1902. Serial No. 95,786. (No specimens.)

Claim.—1. A knitted fabric having fleecing-yarns combined therewith, each of said fleecing-yarns engaging first a wale in one course of the fabric and then a wale in another course of the fabric above or below the said first course, and forming between said points of attachment a loop projecting above the surface of the fabric, and floating over a plurality of courses of the fabric, substantially as specified.



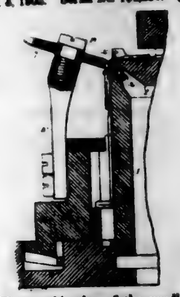
2. A ribbed knitted fabric having fleecing-yarns combined therewith, each of said fleecing-yarns engaging first a wale in one course of the fabric and then a wale in another course of the fabric above or below the said first course, the yarn floating in the form of a projecting loop over a plurality of courses of the fabric between its successive points of engagement with the fabric, substantially as specified.

3. A knitted fabric having fleecing-yarns combined therewith said fleecing-yarns extending in a direction parallel with the wales of the fabric, engaging with wales in separate courses of the fabric, and forming between successive points of attachment loops projecting above the surface of the fabric, and floating over a plurality of courses of the fabric, substantially as specified.

4. A ribbed knitted fabric having fleecing-yarns combined therewith, said yarns extending in a direction parallel with the wales of the fabric, engaging with wales in separated courses of the fabric, and forming projecting loops between their points of engagement, said loops floating over a plurality of courses of the fabric, substantially as specified.

5. A ribbed knitted fabric having fleecing-yarns combined therewith, each of said yarns engaging wales of both faces of the fabric, first in one course of said fabric, and then in a course above or below said first course, and forming projecting loops between successive points of engagement, which loops float over a plurality of courses of the fabric, substantially as specified.

709,829. **RIB-KNITTING MACHINE.** ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Apr. 3, 1902. Serial No. 101,267. (No model.)



Claim.—1. The combination of the needle-carriers, needles, cam-carriers, cams, and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide, and a toothed wheel acting upon said fleecing-yarn to loop the same and cause it to project beyond the face of the fabric, substantially as specified.

2. The combination of the needle-carriers, needles, cam-carriers, cams, and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide and a pair of toothed wheels acting on said fleecing-yarn to loop the same said wheels being so disposed that one looping action precedes the formation of the knitting-stitches and the other follows the same, substantially as specified.

3. The combination of the needle-carriers, needles, cam-carriers, cams, and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide and a rotating toothed wheel engaging the fleecing-yarn and mounted so that its teeth project between the sinker-wales of the fabric, substantially as specified.

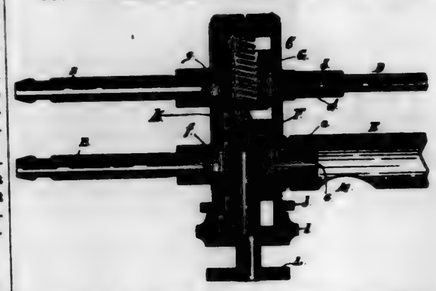
4. The combination of the needle-carriers, needles, cam-carriers, cams and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide, hooked sinkers carried by one of the needle-carriers and constructed to engage with the fleecing-yarn, and a rotating toothed wheel for acting upon the fleecing-yarn so as to cause such engagement, substantially as specified.

5. The combination of the needle-carriers, needles, cam-carriers, cams and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide, longitudinally-adjustable hooked sinkers carried by one of the needle-carriers and constructed to engage with the fleecing-yarn, and a rotating toothed wheel for acting upon the fleecing-yarn so as to cause such engagement, substantially as specified.

6. The combination of the needle-carriers, needles, cam-carriers, cams and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide, laterally-resilient hooked sinkers carried by one of the needle-carriers and constructed to engage with the fleecing-yarn, and a rotating toothed wheel for acting upon the fleecing-yarn so as to cause such engagement, substantially as specified.

7. The combination of the needle-carriers, needles, cam-carriers, cams and knitting-yarn guide or guides of a rib-knitting machine, with a fleecing-yarn guide, longitudinally-adjustable and laterally-resilient hooked sinkers carried by one of the needle-carriers and constructed to engage with the fleecing-yarn, and a rotating toothed wheel for acting upon the fleecing-yarn so as to cause such engagement, substantially as specified.

709,880. **GAS-BLOWPIPE.** GEORGE B. SNOW, Buffalo, N. Y., assignor to the Snow Dental Company, Buffalo, N. Y., a Corporation of New York. Filed July 27, 1899. Serial No. 24,960. (No model.)



Claim.—1. A gas-blowpipe having a valve-casing, a gas-valve and an air-valve located therein and adapted to be opened by pressure of the finger, a spring for closing said valves, and a screw-cap, threaded upon one end of the casing, whereby said valves are confined therein and suitably adjusted; substantially as described.

2. A gas-blowpipe having a valve-casing, a gas-valve and an air-valve located therein and adapted to be opened by pressure of the finger, an adjusting-screw, whereby the distance between the two valves may be varied, and a spring for closing said valves; substantially as described.

3. A gas-blowpipe having a valve-casing, an air-valve and a gas-valve having a stem located therein and adapted to be opened by pressure of the finger, an adjusting-screw located in a central longitudinal hole in the gas-valve, a spring for closing said valves, and a screw-cap, threaded upon one end of the valve-casing, whereby said valves are confined therein and suitably adjusted; substantially as described.

4. A gas-blowpipe having a valve-casing, a gas-valve and an air-valve located therein and adapted to be opened by pressure of the finger, a spring for closing said valves, a screw-cap threaded upon one end of said casing, whereby said valves are confined therein and suitably adjusted, and a mixing-tube attached to the gas-nozzle on the exit side of the valve-casing and having an air-inlet arranged to be conveniently opened or closed; substantially as described.

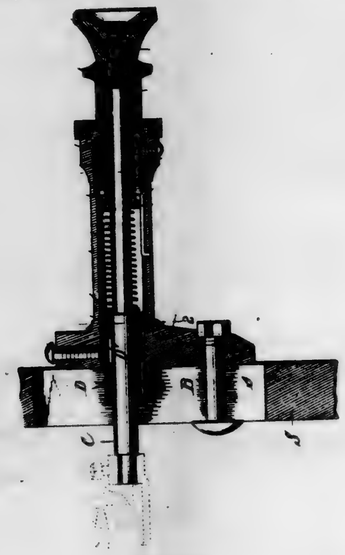
5. A gas-blowpipe having a valve-casing, a gas-valve and an air-valve located therein and adapted to be opened by pressure of the finger, an adjusting-screw whereby the distance between the two valves may be varied, a spring for closing said valves, and a mixing-tube, attached to the gas-nozzle on the exit side of the valve-casing and having an air-inlet arranged to be conveniently opened or closed; substantially as described.

6. A gas-blowpipe having a valve-casing, a gas-valve and an air-valve located therein, said gas-valve having a projecting stem by means of which it may be opened by pressure of the finger, an adjusting-screw located in a central longitudinal hole in the gas-valve, a spring for closing said valves, a screw-cap, threaded upon one end of the valve-casing, and a mixing-tube attached to the gas-nozzle on the exit side of the valve-

casing and having an air-inlet arranged to be conveniently opened or closed; substantially as described.

7. A gas-blowpipe having a valve-casing, an air-tube and a gas-tube joined together at or near the flame end of said gas-tube; one of said tubes being united to the casing by a screw-thread, the other by a butt-joint; substantially as described.

709,831. **BUR-WHEEL SUPPORT FOR KNITTING-MACHINES.** BURTON A. STEWART, Troy, N. Y., assignor of one-half to Ira Albert Tompkins, Troy, N. Y. Filed Apr. 7, 1902. Serial No. 101,823. (No model.)



Claim.—1. In a bur-holder for knitting-machines, the combination of the body, the bur-holding shaft extending therethrough, a rotatable sleeve surrounding the shaft, a threaded cylinder engaging said sleeve, and a spring interposed between a step on the shaft and the said cylinder, substantially as specified.

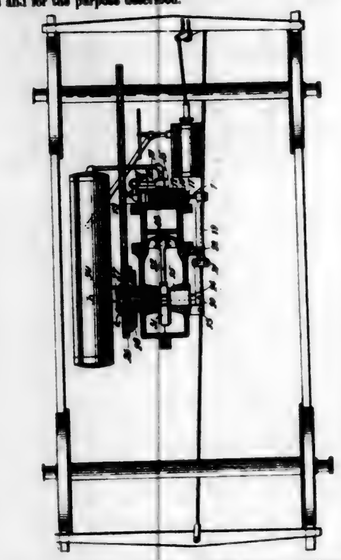
2. In a bur-holder for knitting-machines, the combination of the body, the bur-supporting shaft extending therethrough, a rotatable internally-threaded sleeve in the end of the body, a threaded cylinder within said sleeve, and a spring interposed between a step on the shaft and the said cylinder; with means for rotatively adjusting and locking said shaft, and devices for regulating the forward projection of said shaft, substantially as described.

3. In a bur-holder for knitting-machines, the combination of the body, rotatable sleeves journaled in the front and rear ends thereof, a bur-holding shaft extending through and supported in said sleeves, the front sleeve being non-rotatable on the shaft, but the rear sleeve rotatable thereon, and means for locking the front sleeve; with a threaded cylinder on the shaft engaging a threaded portion of the rear sleeve, a spring interposed between said cylinder and a step on the shaft, and means for adjusting the forward projection of the shaft, substantially as described.

4. In a bur-holder for knitting-machines, the combination of the standard, the body adjustably secured thereto, rotatable sleeves journaled in the front and rear ends of the body, and means for preventing longitudinal movement of said sleeves; with a bur-holding shaft extending through and supported in said sleeves, and rotatable with the front sleeve, a setting-bolt for locking the front sleeve; a threaded cylinder on the shaft within the body engaging a threaded portion of the rear sleeve, a spring interposed between said cylinder and a step on the shaft, and means for adjusting the forward projection of the shaft, substantially as described.

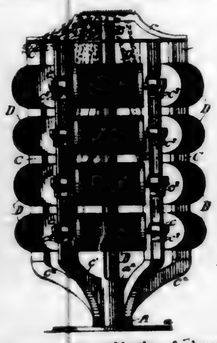
709,832. **AIR-COMPRESSOR.** WELLS J. STEVENS, Shawhegan, Me., assignor to the Stevens Air Brake Company, Shawhegan, Me., a Corporation. Filed Jan. 3, 1902. Serial No. 88,207. (No model.)

Claim.—1. In a compressor, the combination of cylinder, a piston therein, a hollow shaft suitably mounted, a clutch member on the hollow shaft, a pin slidable in the hollow shaft, a second clutch member moved by the pin into engagement with the clutch member on the hollow shaft, an eccentric on the hollow shaft, a piston-rod and eccentric-strap, a controlling-cylinder on the cylinder-head of the first-named cylinder, a piston therein, a spring engaging the piston, a reservoir, a valve between the reservoir and controlling-cylinder, a piston-rod extending through one head of the controlling-cylinder, and levers connecting the piston-rod and pin, as and for the purpose described.



2. In a compressor, a cylinder, a piston therein, a hollow shaft suitably supported, an eccentric on the shaft, a connection between the eccentric and piston, a clutch member on the shaft, a pin in the shaft, a clutch member carried by the pin, means for turning the last-named clutch member, a lever pivoted to a stud of a frame and to the pin, a second lever pivoted to a stud, a link connecting the levers, a controlling-cylinder, a piston and piston-rod therein, the last-named lever being pivoted to the piston-rod, a spring in the controlling-cylinder holding the piston back, a reservoir and connections whereby excess pressure in the reservoir moves the piston against the spring in the controlling-cylinder as and for the purpose described.

709,833. **CREEL FOR SELVAGE-SPOOLS ON SLASHERS.** DAVID M. SULLIVAN, Greensboro, N. C., assignor of one-half to Cesnar Cone, Greensboro, N. C. Filed Jan. 24, 1902. Serial No. 91,050. (No model.)

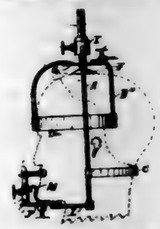


Claim.—1. In a creel, the combination of a base, vertical standards carried thereby, a piece connecting the upper ends of said standards, a yoke-piece extending between two sections of said connecting-piece, means on the standards for supporting shafts for a number of spools, and means on the yoke-piece for guiding threads from spools carried by said shafts, substantially as described.

2. The combination in a creel, of a base, standards supported by the same, shafts carried by said standards, spools on the shafts, each standard supporting the ends of two of said shafts in the same horizontal plane, a central standard carried by the base, a yoke-piece supported by said central standard and by the shaft-carrying standards and means upon said yoke-piece for guiding the threads from the spools, substantially as described.

3. The combination of a base-piece, a number of radiating arms thereon, standards carried by the arms having a headpiece in engagement with their upper portions, spools and means on the standards for supporting the same, a central standard projecting upwardly from the base and a yoke-piece resting upon said central standard and the headpiece and carrying means for guiding the threads from the spools, substantially as described.

709,834. **DENTAL GAGE.** CLARENCE R. VANDERPOOL, Grand Rapids, Mich. Filed Mar. 4, 1902. Serial No. 96,707. (No model.)



Claim.—1. In a dental gage, a vertically-adjustable head-plate, a laterally-adjustable spring-band for the forehead, a forwardly and backwardly adjustable chin-gage and a spring for the back of the neck, substantially as and for the purpose set forth.

2. In a dental gage, a supporting-frame, a vertically-adjustable head-plate therein, a permanent arm secured to said plate and to a spring-gage for the forehead, two auxiliary arms secured to said plate by the links D, an adjusting-rod and thumb-screw attached to said arms, a spring-gage for the forehead supported by said arms and made adjustable thereby, and an adjustable chin support and gage, substantially as and for the purpose set forth.

3. In a dental gage, a supporting-frame, an adjustable head-plate, an adjustable gage for the forehead, an adjustable chin-gage and a back support for the neck, with an adjustable mouth-gage composed of two plates upon vertically-adjustable posts supported upon the chin-gage, substantially as shown and described.

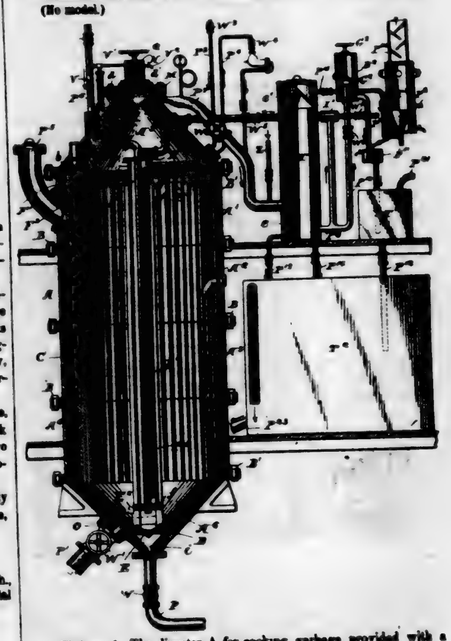
4. In combination with a dental gage, a forwardly and backwardly adjustable chin-gage, and a vertically-adjustable two-plated mouth-gage, substantially as and for the purpose set forth.

709,835. **FENCE-POST.** ISAAC M. WARNER, Union City, Mich., assignor to Frank C. Boise, Union City, Mich. Filed Oct. 1, 1901. Serial No. 77,237. (No model.)

Claim.—1. The combination of a buried anchor, a base-plate above the anchor, anchor-rods attached to the anchor and to the base-plate at diverging points on the latter, means to adjust the base-plate on the respective anchor-rods, a post having its lower end tiltably connected to and secured against lateral movement on the base-plate at a point intermediate the anchor-rods, and brace-rods connected to and extended radially from the post and detachably and adjustably connected to the base-plate at diverging points, whereby the base-plate and post may be adjusted independently of each other, to accommodate the base-plate to the surface of the ground and preserve the perpendicular disposition of the post, substantially as described.

2. The combination of a buried anchor, a rod extending upwardly therefrom to a point above the surface, a base-plate resting on the surface and having an opening near one side through which the upper portion of the said rod extends, the latter being screw-threaded and provided with an adjusting-nut which bears on said base-plate, a post having its lower end tiltably connected to and secured against lateral movement on the base-plate, and a brace-rod secured to said post and detachably and adjustably secured to the base-plate at a point near the anchor-rod, whereby the base-plate and post may be adjusted independently of each other, substantially as described.

709,836. **APPARATUS FOR COOKING GARBAGE.** CHARLES S. WHEELWRIGHT, Bristol, R. I. Filed Apr. 24, 1902. Serial No. 104,451. (No model.)



Claim.—1. The digester A for cooking garbage provided with a central heating apparatus, consisting of the steam-tight cylinder D' extending from the bottom to near the top of said digester, a steam-pipe P^s for providing direct steam to said cylinder and a steam-relief pipe P^r leading from near the bottom of said cylinder, in combination with a live-steam pipe P^s passing through the said cylinder which is provided with suitable packing-boxes at the ends thereof, the heat in said pipe P^s being adapted to be maintained by steam from said pipe P^s, substantially as described.

2. The digester A for cooking garbage provided with a central heating apparatus consisting of the steam-tight cylinder D', extending from the bottom to near the top of said digester, live-steam pipe P^s and steam-relief pipe P^r, in combination with live-steam pipe P^s passing through said cylinder, suitable packing-boxes being provided in the ends of said cylinder and the deflector K, for turning hot steam upward through the mass of garbage, substantially as described.

3. The digester A for cooking garbage provided with a water-pipe P entering at the bottom, and a central heating apparatus, consisting of the steam-tight cylinder D' extending from the bottom to near the top of said digester, live-steam pipe P^s passing through said cylinder, suitable packing-boxes being provided in the ends of said cylinder, and furnishing

direct steam to the contents of said digester, and live-steam pipe P^4 whereby said cylinder is heated and heat is maintained in said pipe P^3, substantially as described.

4. A digester for cooking garbage provided with a steam-pipe adapted to deliver its steam at the bottom of the digester, a valve in said steam-pipe, an exit-pipe for liquid near the top of said digester, a pipe communicating with said steam-pipe inside of the valve therein, and a steam-injector adapted to return a portion of the contents of said exit-pipe through said communicating pipe and said steam-pipe, to the bottom of the digester after the valve in said steam-pipe is closed, substantially as described.

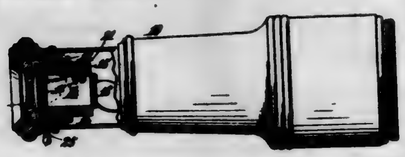
5. A digester for cooking garbage formed in sections with conical ends, and provided with means for causing steam to permeate the contents of the digester from bottom to top, in combination with a filtering or clarifying apparatus having large tanks below the upper conical section of said digester, substantially as described.

6. The combination with the digester A of live-steam pipe P^4 delivering its steam at the bottom of said digester, valve W^2 in said pipe P^3, exit-pipe P^7 for the escape of steam and hot water from said digester, valve W^6 in said pipe P^7, receiving-tank T provided with compartment *c* for receiving steam and hot water from said exit-pipe P^7, pipe P^8 communicating with tank T, pipe I entering pipe P^3, valve W^3 in said pipe I, live-steam pipe P^9, valve W^7 in said pipe P^8, and injector I', whereby when said valve W^2 in said pipe P^3 is closed and the other said valves are open, a circulation of hot water saturated with steam may be maintained, substantially as described.

7. The combination with the digester A, of water-pipe P and valve W therein for furnishing a supply of water, and live-steam pipe P^4, delivering its steam at the bottom of said digester, valve W^2 in said pipe P^3, exit-pipe P^7 for the escape of steam and hot water from said digester, valve W^6 in said pipe P^7, receiving-tank T provided with compartment *c* for receiving steam and hot water from said exit-pipe P^7, pipe P^8 communicating with tank T, pipe I entering pipe P^3, valve W^3 in said pipe I, live-steam pipe P^9, valve W^7 in said pipe P^8, and injector I', whereby when said valves W and W^2 are closed and the other said valves are open, a circulation of hot water saturated with steam may be maintained, substantially as described.

8. The combination with digester A provided with central heating apparatus, cylinder D', and pipes P^5 and P^6, of steam-pipe P^9, valve W^7 pipe P^8, valve W^6, pipe I, valve W^3, receiving-tank T provided with compartment *c*, pipe P^8, and injector I', substantially as described.

709,837. **ELECTRICALLY-CONTROLLED OPTICAL APPLIANCE.** WEBSTER B. WHEELER, Fullerton, Nebr. Filed May 9, 1902. Serial No. 106,699. (No model.)



Claim.—1. In an electrically-controlled optical appliance, a barrel having a shutter carrying a core, and a solenoid, the core being attracted by said solenoid when the latter is energized to thereby operate said shutter.

2. In an electrically-controlled optical appliance, a barrel having a shutter, and a solenoid, a core for said solenoid, carried by said shutter, and an iron strip connected with and adapted to be magnetized by said solenoid and being adapted to be engaged by said core when the same is attracted by the solenoid.

3. In an electrically-controlled optical appliance, a barrel having a shutter controlling the bore of said barrel, and a solenoid, a core for the solenoid carried by the shutter, and means independent of said shutter for also controlling the bore.

4. In an electrically-controlled optical appliance, a barrel having an auxiliary shutter controlling the bore of said barrel, and a pair of auxiliary shutters movable about axes diagonal to the axis of the other shutter, the axes of the two shutters converging toward each other.

5. In an electrically-controlled optical appliance, a barrel having an auxiliary shutter controlling the bore of said barrel, a pair of auxiliary shutters movable about axes diagonal to the axis of the other shutter the axes of the two shutters converging toward each other, and means for positively operating the first-mentioned shutter.

6. In an electrically-controlled optical appliance, a barrel having an auxiliary shutter controlling the bore of said barrel, a pair of auxiliary shutters movable about axes diagonal to the axis of the other shutter, the axes of the two shutters converging toward each other, and a solenoid and its core, the latter being carried by the first-mentioned shutter.

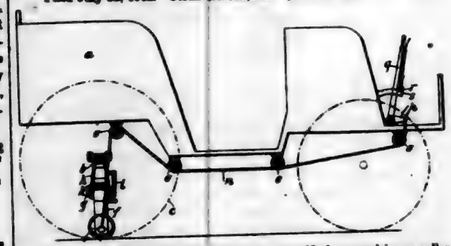
7. In an electrically-controlled optical appliance, a barrel, a shutter for controlling the same, a solenoid inclosing said shutter, and a core for the solenoid carried by said shutter.

8. In an electrically-controlled optical appliance, a barrel, a solenoid in the barrel, a shutter controlling the bore of the barrel and carrying a core for said solenoid, and an iron strip extending longitudinally of the solenoid interiorly of the same, said strip being adapted to be magnetized when the solenoid is energized and serving to hold the core when the same is attracted by said solenoid.

9. In an electrically-controlled optical appliance, a barrel, a shutter for controlling the bore of the barrel, an apertured disk carrying said shutter, a circular plate provided with a flange to receive said apertured disk, also having an aperture in registration with that of the disk, a solenoid into which said flange is fitted, and a core for the solenoid carried by the shutter.

10. In an electrically-controlled optical appliance, a barrel having a solenoid provided exteriorly with a spring-finger adapted to engage the barrel, an apertured plate fitted against one end of the solenoid, and having a circular flange fitted in said solenoid, a disk fitted in said circular plate, a shutter pivotally supported by said disk, carrying a core for the solenoid, a binding-post embedded in the coil of the solenoid and insulated from the barrel, and an iron strip in the solenoid adapted to be engaged by the core of said shutter.

709,838. **MEANS FOR PREVENTING ROAD-VEHICLES FROM SLIPPING SIDEWISE.** RICHARD T. L. WILLIAMS, London, England. Filed July 22, 1902. Serial No. 116,570. (No model.)



Claim.—1. A device for the purpose specified, comprising a roller having a conical running-surface, a sharp edge at the end of said conical surface, a bearing for said roller, and a swing-arm carrying said bearing, substantially as described.

2. The combination, with a road-vehicle, of two arms pivoted thereto so as to be free to swing inwardly, one arm being adjacent to each wheel, stops to limit the outward swing of said arms, conical rollers rotatably carried by said arms, the axes of the rollers being inclined inwardly and rearwardly, substantially as described.

3. A device for the purpose specified, comprising rollers having conical running-surfaces, sharp edges at the ends of said conical surfaces, bearing-surfaces on said rollers, bearing-pins to receive said rollers, swinging arms to support said pins, brackets pivotally attached to said arms, stops for limiting the outward motion of said arms, and springs connecting said arms and said brackets, substantially as described.

4. The combination, with a road-vehicle, of brackets, arms pivotally attached to said brackets, stops for said arms, conical rollers rotatably mounted on said arms, and means for raising said rollers out of contact with the ground, substantially as described.

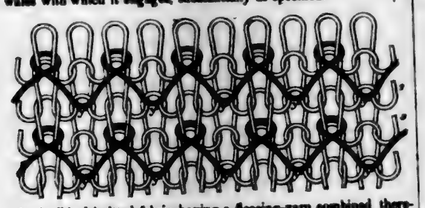
5. The combination, with a road-vehicle, of arms pivotally mounted on said vehicle, stops for said arms, conical rollers rotatably mounted on said arms and having their axes inclined backward at their inner ends, and sharp edges on the inner ends of said rollers, substantially as described.

6. The combination, with a road vehicle, of arms pivotally mounted thereon, stops for said arms, and rollers having projecting edges and rotatably mounted on said arms, the axes of said rollers being inclined backward at their inner ends, substantially as described.

7. The combination, with the rear wheels of a road-vehicle, of arms pivotally mounted on the inner sides of said wheels, means for limiting the movement of said arms in an outward direction, conical rollers having projecting edges and rotatably mounted on said arms, and means for raising said rollers out of contact with the ground, substantially as described.

709,839. **KNITTED FABRIC.** LOUIS H. D. WILLIAMS, Ashbourne, Pa., assignor of one-half to Robert W. Scott, Philadelphia, Pa. Filed Feb. 19, 1902. Serial No. 94,861. (No specimens.)

Claim.—1. A knitted fabric having a flooring-yarn combined therewith, and forming projecting loops, said flooring-yarn being independent of the knitting-yarn and being wrapped or twisted around the stitches of the wales with which it engages, substantially as specified.

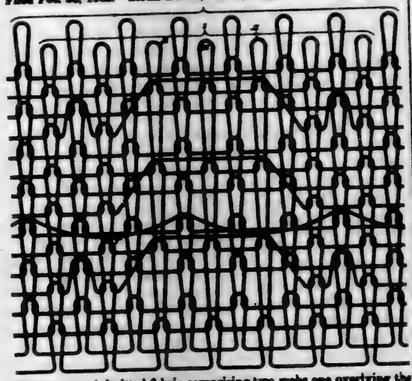


2. A ribbed knitted fabric having a flooring-yarn combined therewith and forming projecting loops, said flooring-yarn being independent of the knitting-yarn and being wrapped or twisted around the knitting-yarn or wale whereby its hold will be tightened by a pull upon the loop tending to lengthen the same, substantially as specified.

3. A ribbed knitted fabric having a flooring-yarn combined therewith and forming projecting loops, said flooring-yarn being independent of the knitting-yarn and being wrapped or twisted around the stitches of the wales with which it engages, substantially as specified.

4. A ribbed knitted fabric having a flooring-yarn combined therewith and forming projecting loops, said flooring-yarn being independent of the knitting-yarn and being wrapped around the knitting-yarn where the same crosses from a wale of one face of the fabric to a wale of the other face of the same, substantially as specified.

709,840. **KNITTED FABRIC.** LOUIS H. D. WILLIAMS, Philadelphia, Pa., assignor of one-half to Robert W. Scott, Philadelphia, Pa. Filed Feb. 22, 1902. Serial No. 95,021. (No specimens.)



Claim.—1. A knitted fabric comprising two webs one overlying the other and the webs being united at intervals, the face web having open-work portions and the back web having closely-knitted portions behind said open-work portions, substantially as specified.

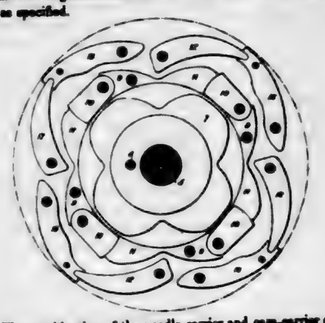
2. A knitted fabric comprising two webs one overlying the other, said webs being united at intervals and one web being composed of yarn differing from that of the other web, the face web having open-work portions and the back web having closely-knitted portions behind said open-work portions of the face web, substantially as specified.

3. A knitted fabric comprising two webs one overlying the other, said webs being united at intervals, one web being composed of yarn having a greater degree of shrinkage than the yarn composing the other web, and the web composed of said first-mentioned yarn having longer stitches than those of the other web, substantially as specified.

4. A knitted fabric comprising two webs one overlying the other, said webs being united at intervals and one face of the fabric having projecting loops of flooring-yarn which yarn is confined to the fabric by engagement with wales of that face web only, substantially as specified.

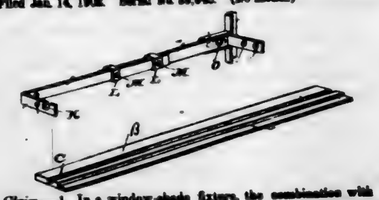
709,841. **KNITTING-MACHINE.** LOUIS H. D. WILLIAMS, Ashbourne, Pa., assignor of one-half to Robert W. Scott, Philadelphia, Pa. Filed May 20, 1902. Serial No. 108,187. (No model.)

Claim.—1. The combination of the needle-carrier and cam-carrier of a knitting-machine, with a templet whereby the needles may be adjusted to such position that their butts will register with the cam-path of the cam-carrier or segment thereof which normally receives said butts, substantially as specified.



2. The combination of the needle-carrier and cam-carrier of a knitting-machine, with a templet serving by contact with the ends of the needle-stems, to so adjust the latter that their butts are in register with the cam-path of the cam-carrier or segment thereof, substantially as specified.

709,842. **WINDOW-SHADE FIXTURE.** CHARLES I. WIENER, Columbus, Ohio, assignor of one-third to Jennie Moore, Columbus, Ohio. Filed Jan. 14, 1902. Serial No. 89,643. (No model.)



Claim.—1. In a window-shade fixture, the combination with the window-frame, the guide-strips secured to the frame, the brackets having the vertical flange fitting in and guided by said strips, the slotted arm formed at a right angle to and on the brackets and having lips, the plates each having their inner ends overlapping and adjustable in the slotted lipped arms of the brackets, angled portions on the plates to receive the shade, and means for raising and lowering the fixture.

2. In a window-shade fixture, the combination with the frame, the vertical strips having the guide groove or channel, the brackets having the flange fitting in and adjustable in the channels, the inward-extending lipped portion formed on the opposite side of the brackets, the plates having the angle-arm adjustably connected with the lipped portion of the brackets, the shade-roller mounted in the angle-arms, and the raising and lowering means secured to the arms.

709,843. **LOCKING MECHANISM FOR CARD-INDEX SYSTEMS OR THE LIKE.** DARWIN R. WRIGHT, Washington, D. C. Filed May 22, 1902. Serial No. 108,564. (No model.)

Claim.—1. A filing-receptacle having means for holding and locking the papers or cards to be filed, means for locking the receptacle, operative connections between the receptacle-lock and the paper or card lock, whereby the operation of one will operate the other; substantially as described.

2. A filing drawer or receptacle, a card rod or support therein, a locking-bolt for the drawer or receptacle, and means for locking the card rod or support, with connections between the locking-bolt and the card rod or support locking devices, whereby in the operation of one of said locking devices, the other is also operated; substantially as described.

3. In a filing-receptacle, a card rod or support, a locking-bolt for the receptacle, a locking-lever for the rod, and devices brought into action by the movement of the bolt in one direction to unlock the card-rod, means for holding the bolt in its retracted position, and means for actuating the card-rod-locking lever, when the locking-bolt is released; substantially as described.

4. In a filing-receptacle, a card rod or support, a locking-bolt for the receptacle, a locking-lever for the bolt, a locking-lever for the rod normally engaging the latter, means for releasing the card-rod-locking lever when the locking-bolt is retracted, a catch for holding the bolt in retracted position, and means for releasing the catch to allow the bolt and card-lock to operate; substantially as described.

5. In a filing-receptacle of the character described, a locking-bolt for the receptacle, and means for operating it, a card-rod, a locking-lever engaging therewith and having a portion arranged in the path of movement of the locking-bolt, whereby the retraction of the bolt releases the lever from the rod, and means for returning the parts to normal position; substantially as described.

6. In a filing-receptacle of the character described, a locking-bolt for the receptacle, and means for retracting it, a card-rod, a locking-lever engaging therewith, and having a portion arranged in the path of movement of the locking-bolt, whereby the retraction of the bolt releases the lever from the rod, a catch for holding the bolt in retracted position, and means for releasing the same to allow the return of the parts to normal position; substantially as described.

7. In a filing-receptacle of the character described, a locking-bolt, means for retracting it, a spring-catch to hold it in retracted position, a card-rod, a swinging arm normally spring-pressed to engage the rod, and arranged to be operated to release the rod, by the retraction of the bolt a predetermined distance; substantially as described.

8. In a filing-receptacle of the character described, a locking-bolt, means for retracting it, a spring-catch to hold it in retracted position, a card-rod, a swinging arm normally engaging the rod, and having a projection adapted to be engaged by the bolt when the latter has been retracted a predetermined distance, and means for releasing the spring-catch to allow the parts to return to normal position; substantially as described.

9. In a filing-receptacle of the character described, a locking-bolt for the receptacle, a key-lever engaging the same to retract it under the action of the key, a catch for holding the bolt in retracted position, means extending within reach of the operator for releasing the catch, a card-rod, a locking-lever therefor brought into inoperative position by the retraction of the bolt and released to operate when the spring-catch is released; substantially as described.

10. In a card-index system or similar filing apparatus, a locking device for the receptacle, a card rod or support, and means for locking the same, with suitable connections between the locking device for the receptacle and the card-rod-locking device, whereby the operation of one will effect the operation of the other either to lock or unlock; substantially as described.

11. In a card-index system or similar filing apparatus, a locking device for the receptacle, a plurality of card-rods, a single locking-lever for said card-rods, and means for unlocking in one operation both the receptacle and the card-rods, and means for returning the devices to locking position; substantially as described.

12. In a card-index system or similar file apparatus, a locking device for the receptacle, a card rod or support and means for locking the same, means for unlocking in one operation both the receptacle and the card rod or support and means for returning the devices to locking position; substantially as described.

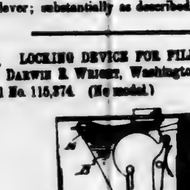
13. In a card-index system or similar file apparatus, a locking device for the receptacle, a card rod or support and means for locking the same, means for unlocking in one operation both the receptacle and the card rod or support and means for successively returning at one operation the devices to locking position; substantially as described.

14. A card-index system or similar file apparatus, a locking device for the receptacle, a card rod or support and means for locking the same, means for unlocking successively at one operation both the receptacle and the card rod or support and means for returning the devices to locking position; substantially as described.

709,844. LOCKING DEVICE FOR FILING-RECEPTACLES OR THE LIKE. DARWIN R. WRIGHT, Washington, D. C. Filed May 28, 1902. Serial No. 109,202. (No model.)

Claim.—1. In a card-indexing system or similar filing apparatus, a locking device for the receptacle, a card rod or support, and means for locking the same, means for unlocking at one operation both the receptacle and the card rod or support, and means for returning the devices to locking position independently of each other; substantially as described.

2. In a card-indexing system or similar filing apparatus, a locking device for the receptacle, a card rod or support, and means for locking the same, means for simultaneously unlocking both the receptacle and the card rod or support, and means for returning the devices to locking position; substantially as described.



3. In a card-indexing system or similar filing apparatus, a locking device for the receptacle, a card rod or support, and means for locking the same, means for simultaneously unlocking both the receptacle and the card rod or support, and independently-operated means for returning the devices to locking position; substantially as described.

4. In a card-indexing system or similar filing apparatus, a locking-bolt for the receptacle, a card rod or support, and a locking-lever therefor, means for retracting the bolt and locking-lever, means for holding them in retracted position, and means for releasing them independently; substantially as described.

5. In a card-indexing system or similar filing apparatus, a locking-bolt for the receptacle, a card rod or support, and a locking-lever therefor, means for retracting the bolt and locking-lever, catches for holding the same in retracted position, and means for releasing the catches independently; substantially as described.

6. In a card-indexing system or similar filing apparatus, a locking-bolt for the receptacle, a card rod or support, and a locking-lever therefor, means for simultaneously retracting the bolt and locking-lever, catches for holding the same in retracted position, and means for releasing the catches independently; substantially as described.

7. In a card index system or similar filing apparatus, a locking device for the receptacle, a card rod or support, and means for locking the same, means for unlocking the receptacle and card rod or support in one operation, catches for holding the parts in unlocked position, and means for releasing the catches independently of each other; substantially as described.

8. A filing-receptacle having a locking-bolt, a card rod or support, and a locking-lever therefor; a pivoted lever connecting the locking-bolt and locking-lever, means for operating the pivoted lever to retract the locking-lever in one operation with the bolt, and means for releasing the bolt and locking-lever; substantially as described.

9. A filing-receptacle having a locking-bolt, a card rod or support, and a locking-lever therefor, a pivoted lever normally engaging the locking-bolt and locking-lever, means for operating the same to retract the bolt and locking-lever, and means for releasing the bolt and locking-lever; substantially as described.

10. A filing-receptacle having a locking-bolt, a card rod or support, and a locking-lever therefor, a pivoted lever normally engaging the locking-bolt and locking-lever, means for operating the same to retract the bolt and locking-lever, catches for holding the bolt and locking-lever retracted, and means for operating the catches to cause them to release the bolt and locking-lever; substantially as described.

709,845. LOCKING DEVICE FOR FILING-RECEPTACLES OR THE LIKE. DARWIN R. WRIGHT, Washington, D. C. Filed July 12, 1902. Serial No. 115,374. (No model.)

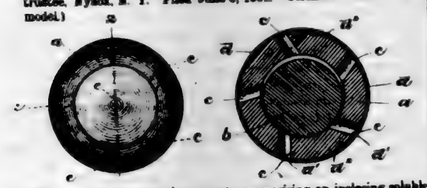
Claim.—1. In a card-index system or similar filing apparatus, a card rod or support, a locking device therefor, a locking device for the receptacle, and a movable support carrying both locking devices, and means for unlocking and locking them in one operation; substantially as described.

2. In a card-index system or similar filing apparatus, a card rod or support, a locking device therefor, a locking device for the receptacle, and a movable support carrying both locking devices, and means for unlocking them, a catch for holding the movable support in retracted position, and means for releasing the catch to allow the return of the support; substantially as described.

3. In a card-index system or similar filing apparatus, a card rod or support, a locking device therefor, a locking device for the receptacle, and a movable support carrying both locking devices, and means for unlocking them, said movable support having a series of notches, a catch respectively engaging said notches as the support is moved to successively unlock the receptacle and card-rod, and means for releasing the catch; substantially as described.

4. In a card-index system or similar filing apparatus, a locking device therefor, a card rod or support, a locking device therefor, and a single pivoted lever carrying the locking device for the receptacle and for the card rod or support, and means for operating it; substantially as described.

709,846. AMMONIA-GENERATOR. JAMES A. YOUNG, Nyack, N. Y., assignor, by direct and mesne assignments, to Conrad Doerrsch, trustee, Nyack, N. Y. Filed June 3, 1901. Serial No. 62,582. (No model.)



Claim.—1. An ammonia-generator comprising an inclosing soluble member, and an inner soluble member or core, the inclosing member having orifices which receive liquid and conduct it to the inner member.

2. An ammonia-generator comprising an inclosing soluble member, and an inner soluble member or core, the inclosing member having orifices which receive liquid and conduct it to the inner member and are sealed at their outer ends by penetrable and relatively insoluble caps.

3. An ammonia-generator comprising an inclosing soluble member, and an inner soluble member or core, the inclosing member having a shell which is relatively insoluble, and orifices which extend to the inner member.

4. An ammonia-generator comprising an inclosing soluble member, and an inner soluble member or core, the inclosing member having a shell which is relatively insoluble, and orifices which extend to the inner member and are closed at their outer ends by parts of said shell.

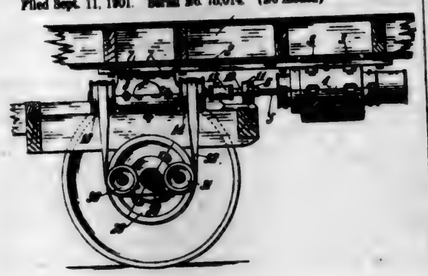
5. An ammonia-generator comprising an inclosing soluble member, and an inner soluble member or core, the inner member being loose within the outer member, so that a space exists between the two members, while the outer member has orifices extending to said space.

6. A soluble ammonia-generator comprising a rotatable inclosing member, and an inner member or core, the inclosing member having orifices which are tangentially arranged, whereby the gases generated by the entrance of water into said orifices are caused to rotate the generator.

7. A soluble ammonia-generator comprising a spherical hollow outer member, and a spherical inner member or core within the outer member, the outer member having tangential orifices.

8. A soluble ammonia-generator comprising an inclosing member, and an inner member or core, the inclosing member having a shell which is relatively insoluble, and orifices which extend to the inner member, said shell being composed of an inner layer d^2 and an outer layer d.

709,847. MEANS FOR DRIVING GENERATORS BY POWER TAKEN FROM CAR-AXLES. JOHN L. CREVELING, New York, N. Y. Filed Sept. 11, 1901. Serial No. 75,014. (No model.)



Claim.—1. The combination of a movable vehicle and bed-plate or frame secured thereto, a generator and a driving-gear, embodying a pulley intermediate the generator and the support for the driving-gear, means for securing the generator and driving-gear to the bed-plate in operative positions fixed with respect to each other, and a shaft and disengageable coupling or connection 11 intervening between the generator and the driving-gear, and an endless belt, whereby either the generator or the driving-gear may be removed from the structure and replaced by a duplicate without the necessity of readjustment of the parts, and the coupling may be separated in order that the belt may be placed around the pulley without disturbing the relations of the parts.

2. The combination of a bed-plate or frame secured to a car, a generator and its driving-gear and means for supporting the generator and driving-gear from the car in fixed operative relation to each other from the common bed-plate or frame, an endless belt, a separable coupling intervening between the generator and driving-gear and a pulley driven from the car-axle, the said endless belt connecting the said pulley and driving-gear.

3. The combination of a car and generator supported thereby, an endless belt receiving motion from the motion of the car and a driving-gear also supported by the car, and a freely-disengageable coupling or connection intervening between the driving-gear and the generator which when separated affords an opening for the passage of the endless belt.

4. The combination of a source of power liable to reversals in direction of movement, a direct-connected generator and a driving-gear therefor driven from the source of power aforesaid and connected by a separable clutch and a single endless belt whose direction of movement follows the direction of movement of the reversible source of power, and which may be passed through the separable clutch, the said driving-gear being organized to drive the generator in a single direction, notwithstanding reversals in direction of movement of the belt.

5. The combination of a generator, a source of power whose direction of motion is liable to reversals, a driving-gear intervening between the source of power and the generator, and embodying in its structure a plurality of clutches adapted to communicate motion in one direction only to the generator, irrespective of the reversals of the direction of movement of the source of power, one of the said clutches by its engagement causing complete disengagement of the other.

6. The combination of a car, a generator, and belt deriving its movement from the rotation of the axle of the car, and a suitable shaft provided with a plurality of clutches each comprising separable parts and means for separating the parts of one clutch by the engagement of the parts of the other clutch.

7. The combination of a generator and a driving-gear comprising in its structure a plurality of automatic clutches deriving motion from a single belt, one of the clutches being entirely disengaged and the other engaged during the entire time that it is in service or until a reversal of movement of the belt takes place.

8. The combination of a generator and a driving-gear comprising in its structure a plurality of connected clutch members only one of which is in driving engagement at a time, the other being entirely disengaged, and a spring device forming part of the connection between the clutches and acting upon the said clutch members to permit either to yield.

9. In a driving-gear the combination of a shaft and a plurality of clutches coöperating therewith, and adapted to be driven in opposite directions and each subject to reversals of motion and means whereby disengagement of one clutch causes the engagement of the other.

10. The combination of a generator having a rotary shaft, a driving-gear having a rotary shaft adapted to be driven in one direction only irrespective of reversals of the driving power, and a clutch or coupling serving to transmit motion from one of the shafts to the other in one direction only whereby the generator may be rotated in one direction without affecting the driving-gear clutch mechanism.

11. The combination of a generator and driving-gear and a clutch or coupling intervening between the said generator and driving-gear having means adapted to be engaged or disengaged by the relative direction of rotation of the respective shafts of the generator and driving-gear.

12. The combination of a generator and a driving-gear therefor, comprising in its structure a shaft, a plurality of separable clutches coöperating therewith and means whereby one clutch entirely disengages the other clutch by motion derived from its own engagement.

13. The combination of a generator and a driving-gear therefor comprising in its structure driving clutch members, a shaft, clutch mechanism fixed upon the shaft to revolve therewith and having a lateral motion thereon to engage the driving clutch members.

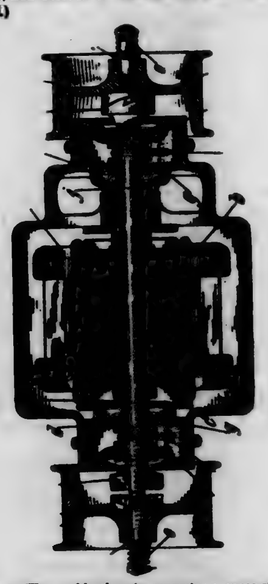
14. The combination of a generator and a driving-gear therefor, comprising in its structure a shaft, a plurality of separable clutches and a plurality of coöperating pulleys rotatable in opposite directions, and means whereby the rotation of one pulley will cause lateral movement and en-

gagement of a laterally-movable member of the clutches with the other pulley.

15. The combination of a generator having a rotary shaft, a driving-gear having a rotary shaft adapted to be driven in one direction only irrespective of reversals of the driving power and a clutch or coupling serving to transmit motion from one of the shafts to the other in one direction only whereby the driving-gear may be rotated in one direction without rotating the armature.

16. The combination of a generator and driving-gear arranged in fixed operative relation to each other, and a driving-pulley and an endless belt transmitting motion from the driving-pulley to the driving-gear, of a disengageable coupling 17 connecting the generator and driving-gear and permitting the application of an endless belt, substantially as described.

709,848. COMBINED DYNAMO AND DRIVING-GEAR. JOHN L. CHEVELIER, New York, N. Y. Filed Nov. 18, 1901. Serial No. 82,717. (No model.)



Claim.—1. The combination of a generator, a source of power whose motion is liable to reversals, a driving-gear intervening between the source of power and the generator and embodying in its structure clutch mechanism and coöperating pulleys placed on opposite sides of the armature adapted to communicate motion in one direction only to the generator, irrespective of the reversals of the direction of movement of the source of power.

2. The combination of a generator, a source of power whose direction of motion is liable to reversals and clutch mechanism and coöperating pulleys placed at opposite ends of the armature, adapted to communicate motion in one direction only to the generator, irrespective of the reversals in direction of movement of the source of power.

3. In a car system of distribution, the combination of a generator, a hanger therefor, pulleys and coöperating clutch members on each side of the hanger, a pulley driven from the axle of the car and an endless belt engaging all of said pulleys.

4. In a system of distribution for railway-cars, the combination of a generator, a hanger therefor, pulleys on either side of the car-axle and hanger and clutch members and coöperating means intervening between the pulleys, the clutch members of one pulley being entirely out of engagement when the clutch members of the other pulley are engaged.

5. The combination of a generator, provided with a shaft, a plurality of pulleys, a hollow shaft concentric with said shaft adapted to communicate motion to a movable part of the generator and clutch mechanism intervening between the pulleys and the hollow shaft.

6. The combination of a generator having a shaft, a plurality of clutches upon the said shaft, one on each side of the generator, and means whereby one of the clutches is entirely disengaged and the other is entirely engaged during the entire time it is in service or until a reversal of movement of the driving force.

7. The combination in a car-lighting system of a generator having a reversible source of power, a movable part, a plurality of shafts concentric with each other, a plurality of clutches each clutch having a member carried by one shaft and a plurality of pulleys each carrying a clutch member, said clutch mechanism being so connected to the generator as to communicate motion thereto in one direction only irrespective of the reversals of movement of the source of power.

8. The combination in a car-lighting system of a variable source of power, a generator comprising in its structure a rotary part and a shaft for driving the same, the said shaft being provided with pulleys one on each side of the said rotary part and clutches intervening between the said pulleys and the said rotary part, whereby the said rotary part is driven in one direction only.

9. The combination of a generator driven from a reversible source of power, a shaft, a plurality of pulleys concentric with the said shaft on opposite sides of the generator and a plurality of positively-engaging clutches adapted to communicate motion to the generator in one direction only irrespective of the reversals of direction of movement of the source of power.

10. A generator provided with a shaft combined with a plurality of pulleys concentric with said shaft one on each side of the generator and clutch members each clutch member coöperating with a part forming a part of the driving-gear of the generator, the said clutch members being engaged one from the other by reciprocal action and one clutch member being entirely disengaged when the other is engaged.

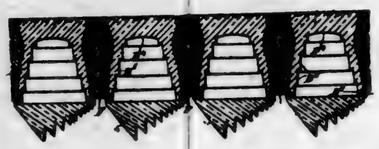
11. The combination of a dynamo-frame constituting a shaft hanger or support and a shaft and a plurality of pulleys, one on each side of the dynamo-frame each adapted to drive the dynamo and means intervening between the pulleys whereby the pulleys may be driven in opposite direction.

12. In a system of distribution for railway-cars, the combination of a generator, a casing therefor serving as a hanger or support for the generator, and pulleys and coöperating clutches on either side of the same, each pulley open at one side to permit the application thereto of an endless belt passing around other pulleys without the necessity of opening or splicing the belt.

13. The combination of a generator, a dynamo-frame serving as a hanger or support therefor, driving-pulleys for the said generator on opposite sides thereof, and revolving in opposite directions, and a plurality of clutches, one clutch coöperating with each pulley and means whereby the movement of engagement of one clutch serves to effect the complete disengagement of the other clutch.

14. The combination with a car of a pulley deriving rotation from motion of the car of a generator having an armature and pulleys in proximity to the ends of the armature and clutch members transmitting motion from the pulleys to the armature in one direction only and an endless belt engaging all the above-named pulleys.

709,849. VAULT-LIGHT. ALPHONSE DU MAS, New York, N. Y. Filed Oct. 19, 1901. Serial No. 79,258. (No model.)



Claim.—1. A vault-light, comprising a self-sustaining concrete slab and diverging lenses embedded therein, and each having a hollow extension at its under side, the opening of the extension increasing in size toward the bottom, the top of the lens being so constructed relative to the extension-opening that the downward rays emerging from the inner face of the top will pass in diverging beams through the extension-opening, the extension having prismatic ribs running crosswise of the axis of the lens at the inner surface of the extension-walls, as set forth.

2. A vault-light having a diverging lens provided with an integral hollow extension at its under side, the opening of the extension increasing in size toward the bottom, the top of the lens being so arranged relative to the extension-opening that the downward rays emerging from the inner face of the top will pass in diverging beams through the extension-opening, the said inner face of the extension being provided with prismatic ribs extending crosswise of the axis of the lens and arranged to intercept and refract through the prisms downward rays of light entering into the mass of the wall of the extension, the outer side of said extension being contracted between the top and the bottom as set forth.

3. A vault-light having a diverging lens, and a hollow extension at the under side of the lens, the opening of the extension increasing toward the bottom, the inner face of the top of the diverging lens being concave, the curvature of said surface corresponding to the size of the extension-opening, so that the downward rays emerging from the said inner face of the top of the lens will pass through the extension-opening in a direction approximately parallel with the inner face of the wall thereof, the inner wall of the extension having a series of prismatic ribs extending crosswise of the axis of the lens and arranged in step form to intercept and refract through the prisms the downward rays entering into the mass of the wall of the extension, the outer side of the wall of said extension having a curved constructed portion between the top and bottom, as set forth.

4. A vault-light having a diverging lens with a hollow extension therefor, the opening of the extension increasing toward the bottom of the extension so as to bring the inner face of the wall of the extension parallel with the rays emerging from the inner surface of the lens above, the said inner face of the wall of the extension having prismatic ribs running crosswise of the axis of the lens and arranged in step form to intercept and refract through the prisms, the downward rays entering into the mass of the wall of the extension, as set forth.

5. A vault-light, comprising a concrete slab, reinforce members embedded therein, and lenses embedded in the said slab and extending from the top to the bottom thereof, the lenses each having a hollow extension the opening of which increases in size toward the bottom, the inner side of the wall of the extension having prismatic ribs crosswise of the axis of the lens and arranged in step form and deflecting the rays of light sidewise through the prisms, the reinforce members extending in the slab material between adjacent lenses, as set forth.

6. A vault-light having lenses with hollow extensions and pendants secured thereto, the lenses and the extensions serving to send the rays of light in a downward direction, and the said pendants closing up the lower part of the hollow extension, the under part of each pendant being provided with graduated prism-ribs, the lower projecting edges of the prism-ribs extending in a slanting line whereby the horizontal refracted rays will not be intercepted by adjoining prism-ribs, as set forth.

7. A lens for vault-lights, comprising a top having its under side concave and a hollow extension for the top, the opening in the said extension increasing in size from the top to the bottom, the curvature of the under face of the top corresponding to the size of the opening to cause the downward rays emerging from the inner face of the top to pass through the extension-opening parallel with the inner surface thereof, the said inner surface of the extension having prismatic cross-ribs arranged one above the other in different vertical planes, to intercept and refract through the prisms the downward rays entering into the mass of the wall of the extension, a pendant closing the bottom opening of the hollow extension and having graduated prismatic ribs, and a transparent material in the joint of said extension and bottom pendant, as set forth.

8. A vault-light, comprising a concrete slab and lenses embedded therein, each lens having a contracted outer surface and comprising a top having its under surface concave to diverge the rays of light, and a hollow extension for the top having its opening increasing in size toward the bottom, the curvature of the under surface of the top corresponding to the size of the extension-opening to cause the downward rays emerging from the inner concave surface of the top to pass through the extension-opening approximately parallel with the inner surface of the wall thereof, the inner face of the extension having prismatic ribs, and a waterproof and elastic material interposed between the slab material and the lens and forming with the latter a mirror-surface to reflect the rays passing into the extension-body, as set forth.

9. A vault-light, comprising a top and a hollow integral extension on the under side of the said top, the said top having its upper and under surfaces arched, and the inside of the said extension being provided with prism-ribs extending crosswise of the axis of the lens, and a pendant having a flange for attachment to a flange on the said extension, the said pendant also having graduated prism-ribs at its under side and arranged in step form, as set forth.

10. A lens for a vault-light, comprising a top, a depending hollow extension therefor, the opening in the extension increasing in size from the top to the bottom, the inner wall of said extension being provided at its opposite sides with undercuts forming prism-ribs, the ribs of each side being arranged one above the other but in different vertical planes, and a pendant closing the said hollow extension at the lower end, the pendant having a series of prism-ribs at its under side, the ribs of the pendant being graduated in size and arranged in step form, as set forth.

11. A vault-light comprising a concrete slab, lenses embedded therein, each lens being rectangular in shape and comprising a top and a depending hollow extension for the top, the lenses each having a contracted outer surface, a coating for the said outer surface to form a reflecting mirror-surface thereof, the opening of the said hollow extension increasing in size from the top to the bottom and the inner surface of said extension being provided at opposite sides with undercuts forming prism-ribs, the ribs of each side being in different vertical planes, and a pendant closing the hollow extension at the lower end and having a series of prism-ribs at its under side, the ribs being graduated in size and arranged in step form, as set forth.

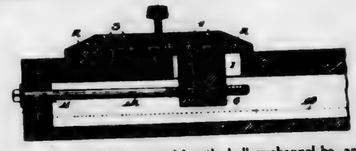
12. A vault-light provided with a lens comprising a top, concave on its under side for diverging the rays passing through the top, and a depending hollow extension for said top, the opening in the extension increasing in size from the top to the bottom, the inner face of the wall of said extension being so arranged relative to the concave top that the diverging rays extend parallel therewith, the lens having a contracted outer surface and a coating for said outer surface to form a reflecting mirror-surface thereafter, the said inner wall of the extension being provided at opposite sides with a series of undercuts forming prism-ribs arranged one above the other in different vertical planes, the said prism-ribs being arranged to intercept and refract the downward rays entering the mass of the wall of the extension as set forth.

13. In vault-lights having prismatic-ribbed surfaces for deflecting the rays of light, a series of graduated prismatic ribs running parallel side by side and having their projecting edges on a slanting line to allow the emerging rays to pass clear of the projecting edges of adjoining prismatic ribs, the opposite sides of each prismatic rib being inclined at different angles to a vertical plane passing through the projecting edge or apex of the rib, whereby one side of each prism deflects the downward rays and the other side allows the deflected rays to pass through and emerge in a lateral direction, as set forth.

14. A lens for vault-lights rectangular in shape and comprising a top and a depending hollow extension, the inner surface of said extension being provided at opposite sides with parallel prismatic ribs extending crosswise of the axis of the lens, the ribs of each side being arranged one above the other but in different vertical planes, as set forth.

15. A lens for vault-lights comprising a top concave on the under surface for diverging the downward rays passing through the top, and a depending hollow extension for said top, the opening in the extension increasing in size from the top to the bottom, and so arranged relative to the curvature of the concave top that the rays emerging from the inner surface of the top will pass through the extension-opening approximately parallel with the inner face thereof, the said inner face of the extension being provided at opposite sides with parallel prism-ribs, the ribs of each side running crosswise of the axis of the lens, and arranged one above the other in different vertical planes, as set forth.

709,850. METALLIC TIE. WILLIAM W. PIKE, Garrett county, Md. Filed Oct. 16, 1901. Renewed Aug. 16, 1902. Serial No. 119,915. (No model.)



Claim.—A metallic tie comprising the hollow channel-be. apertured as at 7 in its upper wall, the plates 2, one of which is fixedly held to the top of said tie, a block 6 movable in said aperture, to which block the second of said plates is secured, a block 8 in the end of the tie, a bolt passing through said block 8 and having threaded connection with block 6, substantially as shown and described.

709,851. ARTIFICIAL FUEL. CHARLES B. HARRIS, New York, N. Y., assignor to S. I. Atwater, trustee, New York, N. Y. Filed Jan. 7, 1902. Serial No. 88,783. (No specimens.)

Claim.—1. The herein-described artificial fuel, consisting of petroleum-coke, Texas asphalt, rosin, glutinous matter, water and coal-dust.

2. The herein-described artificial fuel, consisting of petroleum-coke, rosin, glutinous matter, water and coal-dust.

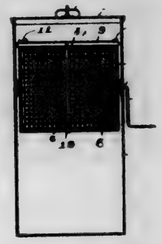
3. The herein-described artificial fuel, consisting of weight of five pounds of petroleum-coke, three and one-half pounds of Texas asphalt, one and one-half pounds of glutinous matter, ten pounds of water and eighty pounds of coal-dust.

4. The herein-described artificial fuel, consisting of petroleum-coke, glutinous matter, water and coal-dust.

709,852. CINDER-SIFTER. HORSEMAN MAYNARD, Montreal, Canada. Filed Dec. 14, 1900. Serial No. 39,996. (No model.)

Claim.—1. In a device of the class described the combination with an inclosing case and a portable screening-box, of a skeleton frame con-

sisting of two rectangular sections centrally secured together substantially at right angles to each other and journaled in said case, means for revolving said frame, and a cover over said frame to hold said screening-box in the frame and to close the screening-box when revolved by the frame.

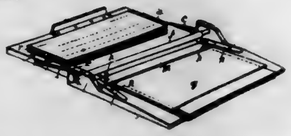


2. A cinder-sifter, consisting of a frame formed by two rectangular sections centrally secured together at right angles to each other and journaled in a support, a crank attached to said frame for rotating the same, a case surrounding the frame, locking mechanism for holding the skeleton frame in normal position, a portable screening-box adapted to be carried by the frame, a cover over the frame and screening-box, and means for locking the cover; said screening-box consisting of a pair of side walls with wire screening extending across three of its sides and fastened to said walls.

3. A cinder-sifter, consisting of a case A, a skeleton frame B journaled in said case and consisting of two rectangular sections centrally secured together at right angles to each other, a crank for revolving said frame, a screening-box C, and a cover over the skeleton frame adapted to close and hold the screening-box in said frame.

4. A cinder-sifter, consisting of a casing A, a screening-box C, a skeleton frame B formed by two rectangular sections centrally secured together at right angles to each other and adapted to receive the screening-box, a crank carried by said frame for rotating the same in the casing, a cover over the frame adapted to close and hold the screening-box within the frame, a lip 10 for receiving the edge of the cover, a jaw 13 carried by the frame and a lever 11 pivoted on the cover to engage the jaw and lock the cover over the screening-box, and the hook 15 for holding the frame in normal position.

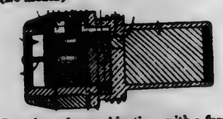
709,853. MANIFOLD DUPLICATING DEVICE. HENRY H. NORRINGTON, West Bay City, Mich. Filed Mar. 31, 1902. Serial No. 100,794. (No model.)



Claim.—1. In a duplicating device, a base, provided with a revoluble carbon-roller, means to secure a series of blanks upon the base, a pressure-plate, and springs having a removable engagement upon said plate.

2. In a duplicating device, a base, brackets upon said base, a revoluble carbon-roller carried by said brackets, means for holding a block of blanks upon said base, a reversible cover provided with arms pivotally engaged at their extremities with said brackets, and with the cover intermediate the longitudinal marginal edges thereof whereby the cover may fold either side uppermost when opened or closed, and means to hold a separate block of blanks upon said cover.

709,854. EXPLOSIVE PROJECTILE OR SHELL FOR ORDNANCE. CARL PUPP, Spandau, Germany. Filed Dec. 9, 1901. Serial No. 85,199. (No model.)



Claim.—1. In a fuse, the combination, with a fuse-case, a fulminate and a firing-pin within said case and a plunger arranged to bring said fulminate and firing-pin together upon impact, of a delay-action device, a carrier mounted on the plunger and supporting the delay-action device, said carrier having an open bore through which the fulminate may communicate with the shell charge, and means for rotating said carrier whereby either the open bore or the delay-action device may be alined with the fulminate.

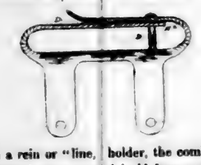
2. In a fuse, the combination, with the fuse-case, a fulminate and a firing-pin within said case, and a plunger arranged to bring said fulminate and firing-pin together upon impact, of a carrier journaled upon the plunger and provided with an open bore, a delay-action device mounted on said carrier, and means for adjusting the delay-action device or the open bore into alinement with the fulminate.

3. In a fuse, the combination, with a fuse-case, a fulminate and a firing-pin within said case, and a plunger arranged to bring the firing-pin and the fulminate together, said plunger having a central standard, of a carrier rotatable on said standard and provided with an open bore, a delay-action device mounted in said carrier, and means for rotating said carrier from the exterior of the fuse-case.

4. In a fuse, the combination, with a fuse-case, a fulminate and a firing-pin within the same, and a plunger arranged to bring said fulminate and firing-pin together upon impact, of a carrier movably mounted on the plunger and provided with a tongue and an open bore, a delay-action device mounted in said carrier, and a ring movably mounted on the exterior of the fuse-case and arranged to engage the tongue of the carrier, whereby the same may be rotated.

5. In a fuse, the combination with a fuse-case having a longitudinal slot, a cap-ring threaded onto said fuse-case, and an adjusting-ring movable about the fuse-case below the cap-ring, said adjusting-ring having an internal recess opposite the slot in the fuse-case, of a fulminate and a firing-pin within the fuse-case, a plunger arranged to bring said fulminate and firing-pin together upon impact, a delay-action device, and a carrier upon which said device is mounted, said carrier having an open bore through which the ignition device may communicate with the shell charge, and also having a tongue extending through the slot in the fuse-case and into the recess in the adjusting-ring.

709,855. REIN-HOLDER. WILLIAM P. SAMPSON, Kansas City, Mo., assignor of one half to Pierre S. Brown, Kansas City, Mo. Filed May 22, 1902. Serial No. 108,568. (No model.)



Claim.—1. In a rein or "line, holder, the combination of a base-plate with four U-shaped arms curved in U form equidistant from each other with holes near their outer ends in combination with two narrow spring-arms formed from a portion of the base-plate and extending from the ends of said base-plate and curved outwardly and back until one overlaps the other, the end of the outer lapped spring-arm being curved slightly upward or outward, a hole through both of said spring-arms and a bolt or pin passing through both, the hole in the lower or inner spring-arm being slotted or made oblong for free movement of said arm on the bolt or pin which passes through it, all substantially as set forth.

2. In a rein-holder the combination of two spring-arms formed from a portion of the base-plate and curved oppositely from the four U-shaped arms, returning until one overlaps the other and when held by a securing-pin causing a strong spring-pressure between the two surfaces in contact.

3. In a rein-holder the combination of a base-plate with four U-shaped arms curved in U form equidistant from each other with holes near their outer ends in combination with two spring-arms having corrugated or milled faces on their contact-surfaces, they being held firmly together by a pin or bolt, said bolt also preventing the reins from passing over and beyond the spring-surfaces.

709,856. POWER-TRANSMITTING MACHINERY. EDWIN WILSON, New York, N. Y. Filed June 10, 1902. Serial No. 111,012. (No model.)

Claim.—1. In a power-transmitting device or clutch, the combination with the driving and driven members thereof, of a crank connecting with one of said members; a grip-lever connecting with the other; and a slot-and-pin connection between said crank and lever substantially as and for the purposes set forth.

2. In a power-transmitting device or clutch, the combination with the driving and driven members thereof, of a crank connecting with one of said members; a grip-lever connecting with the other; a slot-and-pin connection between said crank and lever; and a spring-operated pawl

pressing upon the grip end of said grip-lever, substantially as and for the purposes set forth.

REISSUES.

12,084. THILL-COUPLING. CHRISTOPHER C. BRADLEY, Syracuse, N. Y. Filed June 7, 1902. Serial No. 110,691. Original No. 697,603, dated Apr. 15, 1902. (Division A.)

Claim.—1. In a thill-coupling, the combination of a fixed jaw and a movable jaw, a lever, and a longitudinally-movable bar actuated by the lever and provided with means to open and close the movable jaw, said bar being enabled to change its position lengthwise with reference to the movable jaw.

2. In a thill-coupling, the combination of a fixed jaw, a movable jaw provided with a transverse slot, a lever, and a tightening-bar operated by said lever and arranged with its free end in the slot and capable of lengthwise movement therein for the purpose set forth.

3. In a thill-coupling, the combination of a fixed jaw, a movable jaw provided with a transverse slot, a lever, and a tightening-bar attached to said lever and arranged with its free end in the slot and capable of lengthwise movement therein, said free end having a projection for opening the jaw.

4. A thill-coupling comprising fixed and movable jaws, a lever having a fixed fulcrum, and means actuated by the lever and having a sliding engagement with and independently of the movable jaw to close the same for the purpose described.

5. A thill-coupling comprising fixed and movable jaws, a sliding bar engaging the jaw to close and open the same and having one end movable relatively to the jaw beyond its pivot when the jaw is closed, and means for operating the bar.

6. A thill-coupling comprising a fixed jaw and a movable jaw having a slot, a sliding member having one end movable in the slot relatively to the movable jaw and a lever having a fixed fulcrum and connected to slide said member for the purpose described.

7. A thill-coupling comprising a fixed jaw and a movable jaw having a slot, a lever having a fixed fulcrum, a bar having one end pivoted to the lever and its other end provided with a hook and movable in said slot independently of the movable jaw, the free end of the bar having a sliding contact with one of the walls of the slot to close the jaw as the lever is moved in one direction and the hook engaging the other wall of the slot to open the jaw as the lever is moved in the opposite direction.

12,085. THILL-COUPLING. CHRISTOPHER C. BRADLEY, Syracuse, N. Y. Filed June 7, 1902. Serial No. 110,692. Original No. 697,603, dated Apr. 15, 1902. (Division B.)

Claim.—1. A thill-coupling comprising a fixed jaw and a movable jaw having a slot, a spring having one end inserted in the slot, the movable jaw having a lengthwise-sliding engagement with the spring, and a lever to act on the spring to close the movable jaw.

2. In a thill-coupling, a fixed jaw and a movable jaw, a spring having one end fixed and its other end free and bearing with a sliding engagement against the movable jaw, and a movable cam acting on the spring to close the jaw.

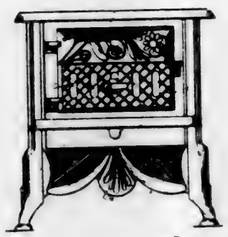
3. A thill-coupling comprising two jaws, one being movable and provided with separated bearing-faces, a spring having one end fixed and its other end in sliding contact with said bearing-faces and tensioned to separate the jaws, and a lever acting upon and against the tension of the spring to close the jaws.

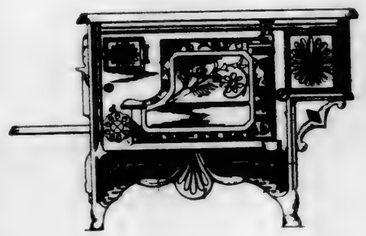
4. A thill-coupling comprising two jaws, one being movable and provided with separated bearing-faces, a spring having one end fixed and its other end in sliding contact with said bearing-faces and tensioned to separate the jaws and a movable cam engaging the spring between its fixed end and the bearing-faces to close the jaws.

5. A thill-coupling comprising a fixed jaw, a movable jaw having separated bearing-faces, a spring fixed at one end and having its other end inserted between the bearings in sliding contact therewith, and a lever provided with a cam to control the operation of the movable jaw.

DESIGNS.

36,081. TOY STOVE. CHARLES A. BAILEY, Cromwell, Conn., assignor to the J. and E. Stevens Co., Cromwell, Conn. Filed June 11, 1902. Serial No. 111,211. Term of patent 7 years.

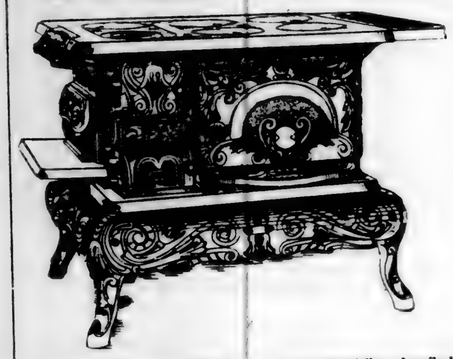




38,081.

Claim.—The ornamental design for a toy stove, as herein shown and described.

38,082. STOVE. MORRIS MAGEE, Philadelphia, Pa. Filed Aug. 26, 1902. Serial No. 121,154. Term of patent 7 years.



Claim.—The ornamental design for a stove, substantially as described and as shown in the accompanying drawing.

TRADE-MARKS

REGISTERED SEPTEMBER 23, 1902.

38,901. PENS. C. HOWARD HUNT PEN CO., Camden, N. J. Filed Aug. 9, 1902.

A symbol representing the point of a writing-pen in a field inclosed by a circular line. Used since July 19, 1902.

38,902. PENCIL-SHARPENERS. EAGLE PENCIL CO., New York, N. Y. Filed Aug. 6, 1902.

EAGLE

The word "EAGLE." Used since 1870.

38,903. SHIRTS, COLLARS, AND CUFFS. HENRY DOBSON, Paterson, N. J. Filed July 30, 1902.

Metropolitan.

The word "METROPOLITAN." Used since July 1, 1902.

38,904. SHIRT-WAISTS AND SKIRTS. GOTTLIEB & BIRK, New York, N. Y. Filed June 30, 1902.

DEFENDER

The word "DEFENDER." Used since January 1, 1900.

38,905. OVERALLS AND SHIRTS AND JUMPERS TO BE WORN IN CONNECTION WITH OVERALLS. JAMES E. ADAMS, Quincy, Ill. Filed June 10, 1902.

The letters "A I" upon a black ground surrounded by a border of concentric rectangular lines. Used since May 1, 1902.

38,906. SILKS. CONSUMERS SILK MILLS AND COUPON EXCHANGE CO., Newark, N. J. Filed July 14, 1902.

The pictorial representation of mills at one hand, women working at sewing-machines at the other hand, and, between, a horn of plenty supplying a stream of coupons flowing from the mills toward the women. Used since June, 1902.

38,907. BOOTS AND SHOES. JOHN W. CARROLL, Lynchburg, Va. Filed May 26, 1902.

The words "LONE JACK" and the representation of the bust of a man smoking a pipe. Used since May, 1900.

38,908. BOOTS AND SHOES. JOHN W. CARROLL, Lynchburg, Va. Filed May 26, 1902.

Brown Dick

The words "BROWN DICK." Used since May, 1900.

38,909. BOOTS AND SHOES. SANGER BROS., Dallas, Tex. Filed July 25, 1902.

The representation of an ox's head surmounting a ribbed shield, with scrollwork forming a semicircle about the ox's neck and the word "HEREFORD" printed on the shield. Used since April 1, 1902.

38,910. MISSES' AND CHILDREN'S BOOTS AND SHOES. DONGOLA DONG SHOE CO., Montclair, N. J., and Boston, Mass. Filed July 31, 1902.

The representation of a young woman standing by a table upon which are various models of boots and shoes, sketches, papers, and designing and drawing appliances. Used since June 1, 1902.

38,911. CERTAIN NAMED BOOTS AND SHOES. DOROTHY DODD SHOE CO., Boston, Mass. Filed July 31, 1902.

Dorothy Dodd

The words "DOROTHY DODD." Used since January 1, 1902.

38,912. MEN'S, BOYS', AND YOUTHS' SHOES. R. A. CORBIN & SON CO., Webster, Mass. Filed July 22, 1901.

OWL

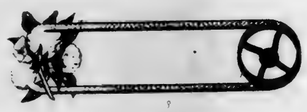
The representation of an owl or the word "OWL," either or both. Used since August 9, 1888.

38,913. FELT AND CERTAIN NAMED FELT GOODS. BINGHAMTON FELTING CO., Binghamton, N. Y. Filed July 15, 1902.

MONOGRAM

The word "MONOGRAM." Used since February 1, 1902.

38,914. COTTON BELTING. THE WHITEHURST BELTING CO., Baltimore, Md. Filed May 23, 1902.



The pictorial representation of flowers or blooms, leaves, and bolls of the cotton-plant. From the cotton bolls the fiber thereof is extended in the form of a belt, which passes over a pulley, shown in perspective. Used since May 3, 1902.

38,915. SOAP. GOODHAIR REMEDY COMPANY, Newark, Ohio. Filed June 9, 1902.

The word "GOODHAIR" and the bust portrait of Fred Johnson, of Newark, Ohio. Used since October, 1900.

38,916. TONIC MEDICINAL COMPOUND. WALTER B. KREHER, Chicago, Ill. Filed July 23, 1902.

38,916.

The figure of a nude athletic muscular man in an upright position, with hands crossed in front and well-developed muscles clearly shown. Used since August 1, 1901.

38,917. TONIC FOR THE BLADDER AND KIDNEYS. THE A. STRIEGL CO., Milwaukee, Wis. Filed July 14, 1902.

JUNIBUCHU

The word "JUNIBUCHU." Used since May 15, 1902.

38,918. CERTAIN NAMED REMEDIAL AGENT. MAIRSDEN & KNAPPE, Sharon Springs, N. Y. Filed July 15, 1902.

PHANGO

The word "PHANGO." Used since June 24, 1902.

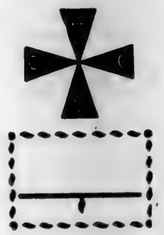
38,919. REMEDIES IN TABLET FORM FOR CERTAIN NAMED DISEASES. BERNARD HOYES ROSCHMONT, Centreeoit, Canada. Filed June 19, 1902.

The representation of two circles, within which are Japanese characters, a stork standing on each side, and the words "YASAI ZUTOO" appearing between the circles. Used since May 1, 1902.

38,920. MEDICINE FOR CERTAIN NAMED AILMENTS. WILLIAM JOHN BAILEY, Cowes, England, executor of the estate of Alfred Fennings, deceased. Filed Oct. 7, 1901.

The representation of a child lying in a cradle. Used since January 12, 1857.

38,921. MEDICINES FOR THE CURE OF PULMONARY TROUBLES AND DISEASES OF THE BLOOD. HALLS CREOSOTE COUGH CURE CO., Cordele, Ga. Filed Aug. 24, 1902.



A cross-shaped figure having the letters "HCCC" on the respective arms of the cross and a rectangular-shaped figure formed of broken lines inclosing a straight line and having a dot below the central portion thereof. Used since April 18, 1901.

38,922. MEDICINAL PREPARATIONS HAVING DIGESTIVE AND NUTRITIVE PROPERTIES. REED & CARNRICK, Jersey City, N. J. Filed Mar. 14, 1902.

The representation of a diamond-shaped figure having ornamental projections at and near the ends of its long axis and near each end a circle, one containing the monogram composed of the letters "R C" and the other the letters "P B," and having between said circles the letters and word "R. and C." Used since December 10, 1901.

38,923. LINIMENTS. ROLLAND R. SHAFER, Hamilton, N. J. Filed July 21, 1902.

The representation of a padlock and two crossed keys. Used since May, 1902.

38,924. PORT AND SHERRY WINES. GEO. G. SANDEMAN SONS & CO., London, England. Filed May 27, 1902.

The representation of rocks appearing on a crest-roll and below a ribbon which bears the words "STAT VERITAS," the said representation, with the ribbon, appearing in a circle. Below the circle and inclining upwardly is the facsimile signature, "GEO. G. SANDEMAN SONS & CO." Below and to the right of the facsimile signature is the representation of rocks on a crest-roll, above which appears a ribbon bearing the words "Stat Veritas." Used since December, 1880.

38,925. CIGARS. JOSEPH H. EDWARDS, Kansas City, Mo. Filed Jan. 21, 1902.

38,925.

The pictorial representation of Charles Darwin; Congo, the African cannibal, and Joe, the famous orang-outang, seated in chairs, appropriately costumed and smoking cigars, the words "CHARLES DARWIN, AUTHOR OF THE THEORY OF EVOLUTION," below the representation of Darwin; the words "CONGO, THE AFRICAN CANNIBAL," below the representation of the cannibal, and the words "JOE, THE FAMOUS ORANG-OUTANG," below the representation of the orang-outang, a chain formed of three links and a broken link above said representations, and the words "THE MISSING LINK" below the said words descriptive of said representations. Used since September 15, 1901.

38,926. FLOUR. DEITZ & ORSHER, Cleveland, Ohio. Filed Aug. 5, 1902.

BOZENA

The word "BOZENA." Used since April, 1900.

38,927. CEREAL FOOD PRODUCT. THE FAIR HAVEN FOOD COMPANY, INC., New Haven, Conn. Filed Aug. 2, 1902.

READY BITS

The words "READY BITS." Used since March 15, 1902.

38,928. CEREAL FOOD PRODUCT. THE FAIR HAVEN FOOD COMPANY, INC., New Haven, Conn. Filed Aug. 2, 1902.

A picture of a grain field and the figure of a man in the foreground cutting the grain. Used since March 15, 1902.

38,929. CERTAIN NAMED PACKING-HOUSE PRODUCTS. SCHWARZSCHILD & SULZBERGER COMPANY, Kansas City, Kans., Chicago, Ill., and New York, N. Y. Filed June 24, 1902.

CENTURY

The word "CENTURY." Used since May 1, 1901.

88,930. CERTAIN NAMED PACKING-HOUSE PRODUCTS. SCHWARZSCHILD & SULZBERGER COMPANY, Kansas City, Kans.; Chicago, Ill., and New York, N. Y. Filed June 24, 1902.

AMERICAN BEAUTY

The words "AMERICAN BEAUTY." Used since July 1, 1898.

88,931. CERTAIN NAMED PACKING-HOUSE PRODUCTS. SCHWARZSCHILD & SULZBERGER COMPANY, Kansas City, Kans.; Chicago, Ill., and New York, N. Y. Filed June 24, 1902.

MAJESTIC

The word "MAJESTIC." Used since May 1, 1901.

88,932. CERTAIN NAMED PACKING-HOUSE PRODUCTS. SCHWARZSCHILD & SULZBERGER COMPANY, Kansas City, Kans.; Chicago, Ill., and New York, N. Y. Filed June 24, 1902.

LAUREL

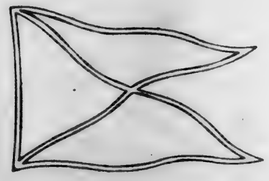
The word "LAUREL." Used since May 1, 1901.

88,933. LARD. THOMAS L. BOYD, Chicago, Ill. Filed July 5, 1902.

WHITE CREST

The words "WHITE CREST." Used since May 7, 1902.

88,934. CANNED SALMON. ALASKA PACKERS ASSOCIATION, San Francisco, Cal. Filed June 16, 1902.



The representation of a divided or fish-tailed flag. Used since November 1, 1893.

88,935. LIQUID-COOLERS. OTTO ROSENWALD, Chicago, Ill. Filed July 26, 1902.

The representation of a spirally-grooved cylindrical shell held on a support with one hand and a scrubbing-brush in the other or right hand applied in the direction of the said grooves. Used since May 16, 1902.

88,936. CERTAIN NAMED PAINTERS' SUPPLIES. THE UNIVERSAL PAINT-SOLVENT COMPANY, San Francisco, Cal. Filed July 7, 1902.

PINXOL

The word "PINXOL." Used since June 24, 1902.

88,937. LAMPS FOR BURNING ACETYLENE GAS. ELECTRO LAMP CO., New York, N. Y. Filed Nov. 8, 1901.

Electrolite

The word "ELECTROLITE." Used since December, 1900.

88,938. PORTABLE ACETYLENE-GAS GENERATORS. JOHN J. HEISLER, Chicago, Ill. Filed Aug. 2, 1902.

"PATHFINDER"

The word "PATHFINDER." Used since May 13, 1902.

88,939. WALL FINISHING AND DECORATING MATERIAL. THE MURALO COMPANY, New Brighton, N. Y. Filed July 26, 1902.

The figure of a double five-pointed star, upon the face of which is represented the sun peeping over the upper part and side of a mutilated pyramid, the latter being partly shown as upon the face of the star-like figure. Used since December 1, 1901.

88,940. ASPHALT AND CERTAIN NAMED PRODUCTS. WEST INDIES COMPANY, New York, N. Y. Filed July 2, 1902.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE EICKELBERG.

Decided September 4, 1902.

PETITION—APPEAL TO EXAMINERS-IN-CHIEF—REJECTION OF CLAIMS.

Where the Examiner has finally rejected the claims on the ground that they are not patentable, *Held* that his action will not be reviewed upon petition, but only upon appeal to the Examiners-in-Chief.

ON petition.

BUCKSAW-FRAMES.

Application of Louis N. Eickelberg filed September 18, 1900, No. 30,389.

Mr. Eickelberg pro se.

ALLEN, *Commissioner:*

This is a petition asking that the Primary Examiner be instructed to reconsider the claims presented in the above-entitled case.

The record shows that the Examiner has given the case careful consideration and after numerous actions has finally rejected the claims as unpatentable. There is no allegation that the final rejection was premature or that there has been irregularity in the Examiner's action. It appears from the brief filed by the petitioner that he is of the opinion that the Examiner erred in reaching the conclusion that the claims are not patentable. His remedy in such case is an appeal to the Examiners-in-Chief from the rejection of the claims. The propriety of that rejection will not be considered upon a petition taken directly to the Commissioner.

The petition is dismissed.

EX PARTE SEITZINGER.

Decided September 5, 1902.

DRAWINGS—CLEAR DISCLOSURE NECESSARY.

The requirement for additional illustration is proper when the drawing does not disclose with certainty what the invention is.

ON petition.

SHAFT-SUPPORT.

Application of Monroe W. Seitzinger filed May 13, 1902, No. 107,065.

Mr. Ed. A. Kelly for the applicant.

ALLEN, *Commissioner.*

This is a petition from the action of the Primary Examiner requiring additional illustration.

The invention consists in means for supporting a pair of shafts at any desired height or angle, and in his first letter in the case the Examiner said that—

it is not clear whether the part D is a draw-bar connected with each one of a pair of shafts or thills, or whether it is an auxiliary device, whose purpose is to support the thills in any desired position.

An examination of the case shows that the Examiner's objection is well founded. The disclosure is not such that a mechanic could with certainty from it make and use the device which the inventor has in mind, since, as stated by the Examiner, it is not clear whether the parts shown are to constitute a separate attachment for supporting the shafts or are to form a part of the shafts themselves and constitute the means of attaching them to the vehicle. Additional illustration is necessary, and therefore this petition is denied.

EX PARTE BRYANT.

Decided September 8, 1902.

1. ALLOWANCE OF APPLICATION—WITHDRAWAL FROM ISSUE.

After an application has been allowed and the notice of allowance sent to the applicant or his agent the act of allowance is complete and the application can be returned to the jurisdiction of the Examiner only by a formal withdrawal from the issue files by the Commissioner.

2. SAME—REGULARITY AND IMPROPRIETY DISTINCT QUESTIONS.

Where the Examiner allows an application and the notice of allowance is properly sent, *Held* that the allowance cannot be set aside after a forfeiture of the case for failure to pay the final fee upon the allegation that it was an error for the Examiner to have allowed it.

3. SAME—NOTICE REGULAR—FORFEITED CASE.

Where a notice of allowance is sent to the attorney who has been prosecuting the case and he afterward raises the question as to his right to prosecute the case and the final decision is in favor of his right, *Held* that the case was regularly allowed and that the final fee not having been paid within six months it is forfeited.

ON petition.

GAS-BURNERS.

Application of Henry Bryant filed December 18, 1896, No. 616,154.

Mr. Vernon M. Dorsey for the applicant.

ALLEN, *Commissioner:*

This is a petition that a new and proper notice of allowance be sent in the above-entitled application.

The records show that the application was prosecuted by an attorney appointed by the inventor and that on the death of said attorney the present attorney was appointed on July 30, 1901, by the

United Acetylene Companies as assignees of the entire interest.

Acting under this appointment, an amendment was filed on October 1, 1901.

On October 21, 1901, the application was examined and forwarded by the Examiner to the Issue Division, and on October 23, 1901, the notice of allowance was mailed to the care of the present attorney.

The records further show that on November 27, 1901, a communication was received by this Office from the attorney for the United Acetylene Companies requesting that the right of said companies to appoint an attorney to prosecute this application be formally recognized by the Office.

Upon consideration of the assignment records the Office replied that, in its opinion, the alleged assignees had no authority to appoint an attorney to prosecute the case and that "the acceptance of the power of attorney seems to have been an oversight."

The power of attorney was consequently returned to the alleged assignees.

Upon a rehearing, however, the power of attorney given by the said United Acetylene Companies was accepted on June 10, 1902.

The petitioner states that—

> the undersigned is aware that a notice of allowance was mailed to him on October 23rd, 1901, and that this case is now placed in the forfeited files, but this notice of allowance was issued on an amendment made by the undersigned in virtue of a power of attorney, which the Office on December 4th, 1901, returned to the undersigned, with a statement that its acceptance "seems to have been an oversight."
>
> The undersigned submits that this return of the power of attorney rendered nugatory the said amendment made by him on October 1st, 1901, and likewise set aside the allowance granted on this amendment, so that the application now awaits action in response to the Office letter of July 3, 1900.

If this reasoning is to be accepted, the present petition would have to be denied.

If, as contended by the petitioner, the action of the Office in returning the power of attorney "set aside the allowance," the subsequent acceptance of the power of attorney must, by following the same reasoning, affirm the allowance.

Under the practice of the Office after an application has been allowed and the notice of the allowance sent to the applicant or his agent the act of allowance is complete and the application can only be returned to the jurisdiction of the Examiner by a formal withdrawal of the application from the issue files.

There can be no question but that the application was examined and sent to the issue files by the Examiner on October 21, 1901. It remained, therefore, to complete the act of allowance by sending to the applicant or his agent formal notice thereof. This was done on October 23, 1901, and the receipt thereof is acknowledged.

The only question, therefore, for determination, in view of all the facts, is whether or not the notice was properly sent. The propriety of the Examiner's action in forwarding the application to issue cannot now be questioned. If a mistake is made by an Examiner in sending an application to issue, the mistake cannot be cured after the notice of allowance has been formally sent except by formally withdrawing the application from issue.

In this case the notice of allowance was sent to the agent, and at that time the authority of the agent to receive said notice had not been questioned. He was, therefore, at the time of the receipt of the notice, both in fact and in law, the agent and was under the provisions of section 4885 the proper person to send the notice of allowance to.

Having reached this conclusion, the application must be held under the provisions of the same section (No. 4885) to be a forfeited application for failure to pay the final fee within six months from the time that the application was passed and allowed "and notice thereof was sent to the applicant or his agent."

The petition is denied.

IN RE MACWILLIAM.

Decided September 9, 1902.

REQUEST FOR COPY OF APPLICATION—IDENTIFICATION OF CASE.

Where a party asks for a copy of an application for use in court and as authority for the request alleges that the applicant testified in the case that such an application was on file, *Held* that the request should identify the application.

IN the matter of the petition of Hugh G. Macwilliam to inspect and be furnished copies of abandoned application of Louis Neuberger for suspender-ends, filed in the year 1899.

Messrs. Collamer & Co. for Macwilliam.

Mr. Herbert Knight for Neuberger.

ALLEN, *Commissioner:*

This is a petition for permission—

> to inspect and make copies of the file in an alleged abandoned application for patent by Louis Neuberger.

It appears from an affidavit filed by the petitioner that on February 19, 1901, Letters Patent No. 668,261 were issued to him and that he has brought suit in the Circuit Court of the United States for the Southern District of New York against the Connecticut Web Company *et al.* for infringement of said Letters Patent and that the Connecticut Web Company in answer to the complaint pleaded prior use of said invention.

It is further stated that one Louis Neuberger was called as a witness on behalf of the defendants and on cross-examination stated that he had abandoned a certain application for Letters Patent which he had filed in the Patent Office in the early part of the year 1899 and that when said application was pending he had marked certain exhibits referred to in evidence with the words "Patent applied for."

The verified statements have not been denied, and therefore are to be accepted as true. (*Metropolitan West Side Elevator Railroad Company* v. *Siemens*, 85 O. G., 290.)

This case differs from one in which the request is made by a defendant for copies of an abandoned application belonging to the complainant, the abandoned application being referred to in the patent upon which the suit is brought. This request is made by the party who has instituted the suit, and the copies of the alleged abandoned application, which is supposed to belong to the defendant, are desired in order to rebut the testi-

mony of the defendant upon the question of prior public use.

The request is defective in that it is not sufficiently explicit. The particular application, copies of which it is desired to obtain, is not specified. In these respects this case differs from that considered in the *Metropolitan West Side Elevator Railroad Company* v. *Siemens*, *supra*.

The petition as now presented is denied.

EX PARTE ROYAL MEDICINE COMPANY.

Decided September 12, 1902.

1. PRINTS—MUST BE DESCRIPTIVE.

A print in order to be registrable must be descriptive of the article which it is intended to advertise.

2. PRINTS AND LABELS—DESCRIPTIVE.

Prints and labels are made registrable by the same section of the copyright law, and the requirement that they indicate the article to which they refer applies to both.

ON appeal.

PRINT FOR PROPRIETARY MEDICINES.

Application filed July 29, 1902, No. 3,195.

Mr. F. W. Smith, Jr., for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the decision of the Examiner refusing to register a print entitled "Bisque Doll" to be used for advertising purposes for proprietary medicines.

As stated in the specification—

> * * * the said print consists of the words and figures, to wit: The representation of a richly-dressed French doll with hat on and standing erect, and the words "Bisque Doll" printed at the bottom about on a level with the feet of the doll.

The Examiner has refused registration on the ground that the copies of the print filed are not descriptive of medicine and cites in support of this holding the decision *ex parte Regina Music Box Company*, (100 O. G., 1112.)

The appellant admits that this print is not descriptive of any medicine, but insists that it is not necessary in order to warrant the registration of a print for said print to be descriptive of the articles advertised.

The decision relied upon by the Examiner is approved by the appellant; but it is argued that said decision does not here apply, as the registration of a label was there considered.

Prints differ from labels only in name and use. Provision is made in the same section of the statute (section 3 of the act approved July 18, 1874, 18 Stat. L., p. 78) for the registration in the Patent Office of both prints and labels. A label is used on the article referred to and of which it is descriptive, and a print though descriptive of the article to which it refers must not be borne on the said article. These being the only differences between the two, the doctrine announced in *ex parte Regina Music Box Company* applies to this case. In fact, said decision did not make a distinction between prints and labels, for it was therein stated—

> the indication must be in the print or label itself and not merely in a statment made by the applicant accompanying it.

In support of the doctrine announced in said decision the decision *ex parte Barnhart Bros. and Spindler* (87 O. G., 2118) was referred to with approval, in which latter decision a "print" alone was considered.

The decision of the Examiner is affirmed.

EX PARTE HOWLETT.

Decided September 15, 1902.

AMENDMENTS—NEW MATTER—PRACTICE.

Where the Examiner is of the opinion that certain descriptive matter inserted by amendment and included in a claim is not warranted by the original disclosure, *Held* that he should reject the claim.

ON petition.

GAS-BURNERS.

Application of Charles A. S. Howlett filed July 29, 1901, No. 70,070.

Messrs. Offield, Towle & Linthicum for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner objecting to certain descriptive matter which has been inserted by amendment in the specification and in claim 2.

It appears that the Examiner is of the opinion that this descriptive matter is not warranted by the original disclosure. Being of this opinion, he should reject the claims on the ground that these amendments involve a departure from the invention originally presented. (Rule 133.)

From such rejection an appeal lies in the first instance to the Examiners-in-Chief.

The petition is dismissed.

EX PARTE SCHÜPPHAUS.

Decided September 13, 1902.

1. APPEAL TO EXAMINERS-IN-CHIEF—REJECTION AFTER INTERFERENCE—RULE 132.

Where a final decision on priority has been rendered against a party in an interference and his claims involved have been finally rejected under Rule 132, *Held* that he has the right of appeal to the Examiners-in-Chief from the rejection.

2. DECISION IN INTERFERENCE—RIGHT TO A PATENT.

Held that a final decision on priority in an interference is not a decision that the defeated party is not entitled to a patent upon the claims, although it may furnish a basis for such a decision.

3. SUBSTITUTE APPLICATION—REFUSAL TO CONSIDER—RIGHTS OF APPLICANT.

Where after a decision against him in an interference a party files a new application as a substitute for the one involved, *Held* that he is entitled to take any action in the new case which he could have taken in the old and that the Office cannot refuse to consider the new case.

ON petition.

IMPROVEMENTS IN MANUFACTURE OF PYROXYLIN COMPOUNDS AND IN PYROXYLIN COMPOUNDS.

Application of Robert C. Schüpphaus filed July 23, 1901, No. 69,455.

Mr. Harold Binney for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner refusing to consider the claims of the above-entitled application on the ground that the question as to their patentability is *res adjudicata*.

This application was filed as a substitute for an earlier one, No. 594,006, covering the same inven-

tion. That earlier case was involved in interference with one Stevens, and in that interference the final award of priority was in favor of Stevens. (95 O. G., 1452.) The petitioner has in the present case reproduced his claims which were included in the declaration of that interference, and the Examiner takes the position that it is *res adjudicata*, that Schüpphaus is not the first inventor and is not entitled to a patent.

The history of Schüpphaus's original application up to the final decision on priority and the contentions made on his behalf are fully stated in the decision of the court of appeals above cited. In the interference Schüpphaus contended that the invention made by Stevens and disclosed in Stevens's application although prior in point of time was not the same as the invention claimed by him. He still makes that contention and upon it bases his present claim that he is entitled to a patent. In other words, considering Stevens's invention as a part of the prior art, he still insists that he is entitled to a patent. The Examiner makes the point that the interference might have been dissolved on motion under Rule 122 if the inventions were not the same, and since it was not, that the question of identity is *res adjudicata*.

The question presented by this petition is not whether Schüpphaus is entitled to a patent upon his claims, but whether the Examiner has authority to refuse to consider those claims. The petitioner contends that he should either reject them upon the proceedings in the interference, and thus give him the right of appeal, or should allow them.

Rule 132 provides that when a final decision on priority has been rendered in an interference the Examiner shall notify the defeated party that his claims involved stand finally rejected. It would seem that the applicant would under the rules have the right of appeal from such a rejection as well as from any other, notwithstanding the improbability in most cases of obtaining any advantage by such an appeal. The decision on priority settles some of the most important questions bearing upon his right to a patent; but it is not a direct decision that he is not entitled to one.

The present application was filed to take the place of that involved in the interference and is therefore a continuation of it. The applicant is entitled to take any action in this case which he could have taken in the original if this had not been substituted for it. He is not attempting to commence the prosecution of the case over again, but is attempting to take the matter up on these new papers where it was left off in the prior case. He was entitled to an appeal in the prior case and should not be deprived of that right in this substitute application.

The petition is granted.

Prohibiting Changes in Office Papers.

It is hereby ordered that no erasures be made or any note, interlineation, or other mark in pencil or otherwise, except by formal amendment duly signed, in the body or written portions of the specification or of any other paper filed in an application for patent.

It is further directed that no change be made by any person in any record of this Office without the written approval of the Commissioner of Patents.

Attorneys, employees of the Patent Office, and all others will be held to strict accountability for any violation of this order.

Indexes to Periodicals.

The following journals containing indexes to periodical literature may be found on file in the reading-room of the Scientific Library:

Electrical World and Engineer, a weekly digest of electrical articles.

Engineering Magazine, a monthly title-index of engineering articles.

Journal of the United States Artillery, a bimonthly title-index of current artillery literature.

Railroad Digest, a monthly synopsis of universal railroad literature.

School of Mines Quarterly, a quarterly synoptical index of articles on analytical chemistry and title-index of metallurgical literature.

Science Abstracts, physics and electrical engineering. Monthly abstracts of the principal articles on physics published in the American and foreign journals.

Oaths of Applicants in Foreign Countries.

It is hereby directed that oaths accompanying applications for patents made within the following-named foreign countries must be taken before a minister, chargé d'affaires, consul, or commercial agent holding commission under the Government of the United States:

Austria-Hungary.
Argentine Republic.
Belgium.
Brazil.
Costa Rica.
Denmark.
Haiti.
Honduras.
Italy.
Mexico.
Netherlands.
Norway.
Peru.
Portugal.
Russia.
San Salvador.
Servia.
Sweden.
Switzerland.

Applications filed in this Office presenting oaths not executed in compliance with this order will be treated as incomplete.

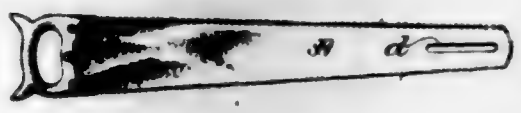
Patents to Assignees.

RULE 201. In every case where it is desired that the patents shall issue to an assignee the assignment must be recorded in the Patent Office at a date not later than the day on which the final fee is paid. (See Rule 26.) The date of the record is the date of the receipt of the assignment at the Office.

PATENTS

GRANTED SEPTEMBER 30, 1902.

709,857. SAW. WILLIAM S. ANDERSON, Boston, Mass., assignor of one-half to Prescott Bigelow, Boston, Mass. Filed Feb. 17, 1902. Serial No. 94,350. (No model.)



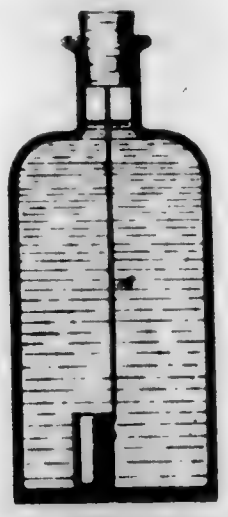
Claim.—1. A handsaw having a cutting edge across its end opposite the handle.

2. A handsaw having a cutting edge across its end opposite the handle and substantially at right angles to the longitudinal axis of the saw.

3. A handsaw having a cutting edge across its end opposite the handle and provided with an aperture adjacent said end, for receiving a pivot.

4. A handsaw having cutting edges upon two sides and across the end opposite the handle and provided with an aperture adjacent said end for receiving a pivot.

709,858. MEASURING AND EMPTYING DEVICE FOR BOTTLES. RUDOLF ARTHUR, Pittsburg, Pa. Filed Dec. 27, 1901. Serial No. 87,444. (No model.)



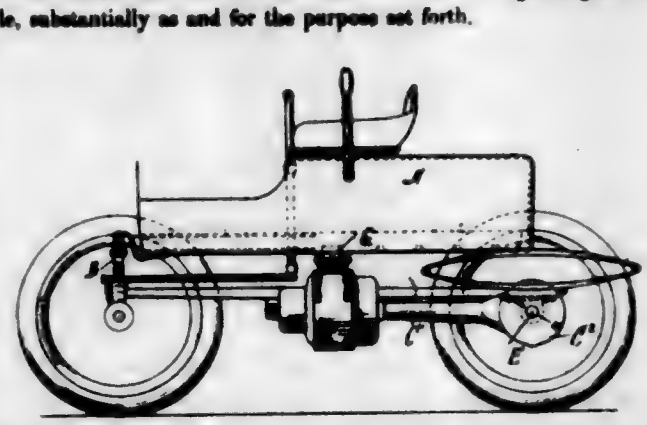
Claim.—1. A measuring-cup for bottles, &c., consisting of a cylindrical metallic shell, a wire secured thereto and constituting a stem adapted to be inserted in a cork, a coating of enamel covering the stem and the inner and outer surfaces of the shell, and a bottom inserted in the lower end of the shell.

2. A measuring-cup for bottles, &c., consisting of a cylindrical metallic shell, a wire secured thereto and constituting a stem adapted to be inserted in a cork, a coating of enamel covering the stem and the inner and outer surfaces of the shell, and a bottom of cork inserted in the lower end of the shell.

709,859. MOTOR-VEHICLE. WALTER C. BAKER, Cleveland, Ohio. Filed Feb. 14, 1902. Serial No. 94,021. (No model.)

Claim.—1. The combination in a motor-vehicle, of the body, the running-gear including the rear axle; and a motor, said motor being supported mainly from the rear axle and means for attaching the motor to the body of the vehicle, said means comprising a rocking bar pivotally secured to the under side of the vehicle-body, and hangers pivotally secured to the opposite ends of the said rocking bar and pivotally connected to the motor, substantially as set forth.

2. In a motor-vehicle, the combination with the rear axle, of a casing, surrounding said rear axle, a receiving-gear casing fixed to the said axle-casing, a transmitting-shaft casing communicating with the receiving-gear casing, and the motor, braces connected to said axle-casing, at or near its outer ends, said braces converging toward and connected to the transmitting-shaft casing, whereby the motor is braced laterally in relation to the rear axle, and allowed free vertical movement at right angles to said axle, substantially as and for the purpose set forth.



3. In a motor-vehicle, a motor and its casing, transversely-arranged rock-shafts pivotally secured to the vehicle-body, hangers pivotally secured to the opposite ends of said rock-shafts and having their opposite ends in pivotal engagement with the motor-casing, whereby a forward as well as lateral movement of the motor is permitted independent of the vehicle-body, and means for supporting and bracing said motor in relation to the rear axle of the vehicle.

4. In a motor-vehicle, the combination with the rear axle, of an axle-casing loosely mounted on said axle, a receiving-gear casing fixed to the said axle-casing, a motor-casing rigidly secured to said receiving-gear casing, and hangers in pivotal engagement with the vehicle-body and the motor-casing, whereby the motor will be permitted to move laterally and longitudinally of the vehicle-body, substantially as described.

5. In a motor-vehicle, the combination with the rear axle, of a motor in fixed relation thereto, and means for permitting the motor to move laterally as one end of the axle is raised or lowered, the said motor pivotally secured to the vehicle-body, and capable of movement independent thereof.

709,860. SAFETY-PIN. WILLIAM F. BALDWIN, Boston, Mass. Filed Apr. 15, 1901. Serial No. 55,840. (No model.)

Claim.—In a safety-pin, the combination of a body member terminating at one end in a spring and at the other end in a pointed return-curve, and an arm extending from the spring and carrying upon its outer terminal a shield to receive and guide the curved point of the body member.

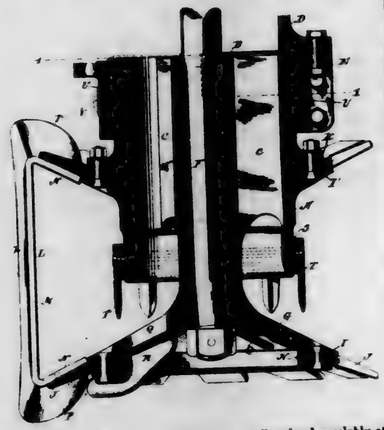
709,861. CUTTER-HEAD FOR HYDRAULIC DREDGERS. LIBBEUS W. BATES, Chicago, Ill. Filed Jan. 14, 1900. Serial No. 1,906. (No model.)

Claim.—1. In combination with a suction-pipe, a substantially vertically disposed cutter-head revolubly attached to the lower end thereof; knives carried by said head; and a unitary means for imparting power directly to said head, alike at both ends thereof, substantially as described.

2. In combination with a suction-pipe, a vertically-disposed hollow cutter-head revolubly connected thereto; knives carried by said head; a unitary means for imparting power directly to said head throughout its entire length, whereby power is applied to both ends of the knives alike, substantially as described.

3. In combination with a suction-pipe, a hollow head revolubly attached thereto; a shaft directly connected to the head for imparting mo-

tion thereto; a disk carried at the lower end of said shaft beneath the head; and a series of knives attached to the head and disk, substantially as described.



4. In combination with a suction-pipe, a hollow head revolubly attached thereto; a shaft extending through said head and securely fastened thereto; a disk G secured to the lower end of said shaft, said disk being provided with a downwardly-inclined upper face; and a series of knives connected to said head and disk respectively.

5. In combination with a suction-pipe, a hollow cutter-head revolubly connected thereto; a unitary means for applying power throughout the length of said head for imparting rotary motion thereto; and knives connected to the upper and lower ends of said head, substantially as described, whereby the power may be applied to both ends of the knives alike.

6. In combination with a suction-pipe, a hollow cutter-head revolubly connected thereto; a driving-shaft extending through said hollow head and securely fastened thereto; a conical disk G secured to the lower end of said shaft; and a series of knives attached at their ends to the head and disk respectively.

7. In combination with a hollow cutter-head A, a shaft secured to said head and extending therethrough for driving the same; a disk secured to the lower end of said shaft; rings connected to said head and disk respectively; and a series of cutters connected at their ends to said rings, substantially as described.

8. In combination with a hollow cutter-head, a driving-shaft secured to and extending therethrough; a disk G secured to the lower end of said shaft, said disk being provided with a downwardly-inclined face; rings attached to said head and disk respectively; and a series of cutters connected to said rings, substantially as described.

9. In combination with a hollow cutter-head, provided with an outwardly-extending rim or flange; a driving-shaft extending therethrough and secured to said head; a conical disk G secured to the lower end of said shaft; rings I', I attached to said cutter-head and disk respectively, said rings being provided with outwardly-extending lugs; and a series of cutters attached to said lugs, substantially as described.

10. In combination with a hollow cutter-head, a shaft secured to said head and extending therethrough for operating the same; a conical disk attached to and carried by the lower end of said shaft; a pair of reversible rings carried by said head and disk; and a series of cutters attached to said rings, substantially as described.

11. In combination with a hollow cutter-head, a shaft extending therethrough for driving the same; a disk G secured to the lower end of said shaft and provided with a downwardly-inclined upper face; rings attached to said head and disk respectively; a series of cutters attached to said rings; and a second series of cutters attached to the lower end of the head and extending down toward the upper face of the disk, substantially as and for the purpose described.

12. In combination with a hollow cutter-head, a shaft extending through the same for imparting rotary motion thereto; a conical-shaped disk G attached to the lower end of said shaft; rings attached to said head and disk respectively; cutters carried by said rings; a second series of cutters carried by the lower end of said cutter-head and extending down toward the upper face of said disk G; and a third series of cutters secured upon the under face of the disk in line with a series of openings formed therein, substantially as described.

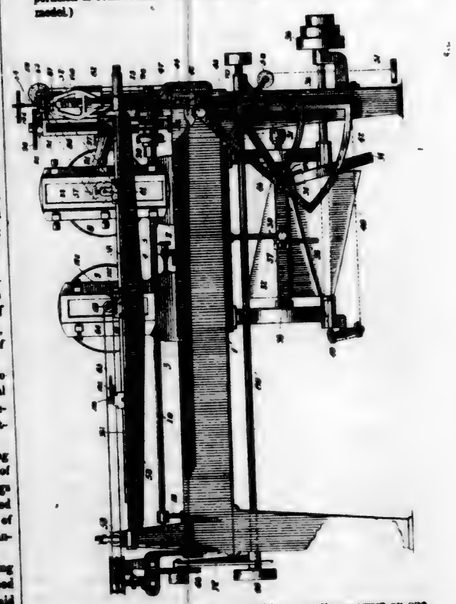
13. In combination with a suction-pipe, a hollow cutter-head, a ring or band E secured to the lower end of said suction-pipe around the upper portion of the cutter-head; a groove or channel intermediate said band or collar and cutter-head; and means for forcing water under pressure into said groove or channel.

14. In combination with a hollow cutter-head, a shaft secured to said head and extending therethrough for driving the same; a conical disk G secured to the lower end of said shaft; rings I, I' carried by said disk and head respectively; and a series of cutter-blades attached to said rings, said blades comprising a straight body-section M, flanges N adapted to bear upon the rings, and inclined cutting-sections O, P, substantially as described.

709,862. **SKIRT-HOLDER.** CHARLES W. BAUSEMAN, Baltimore, Md. Filed Dec. 1, 1900. Serial No. 38,361. (No model.)

Claim.—As an article of manufacture, a skirt-elevator comprising an integral strip of fabric, a series of depending rings carried thereby, said strip adapted to be sewed to the inside of a skirt, said strip also having a perforation at its upper end adapted to register with a similar perforation in the waistband of a skirt, and a cord, one end of which is adapted to be secured to the inner side of a skirt at or near the lower end of said strip and its opposite end to pass upward through the depending rings and the registering perforations and adjustably secured to the holding device on the outer side of the waistband of the skirt, substantially as described.

709,868. **ENGRAVING-MACHINE.** CHARLES B. BISHOP, New Britain, Conn., assignor to P. & F. Corbin, New Britain, Conn., a Corporation of Connecticut. Filed Nov. 7, 1901. Serial No. 81,461. (No model.)



Claim.—1. In a metal-working machine, a pattern-carrier on one side thereof, a die-carrier on each side thereof, means for rotating the pattern-carrier and die-carriers at the same angular speed, a beam on each side of the machine said beams being universally mounted and engaged with each other, and styles and cutting tools carried by said beams.

2. In a metal-working machine, a pattern-carrier on one side thereof, a die-carrier on each side thereof, means for rotating said carriers at the same angular speed, a beam on each side of the machine one end of each of said beams being pivotally mounted, the said beams being engaged with each other at the other ends, and styles and cutting tools carried by said beams.

3. In a metal-working machine, a pattern-carrier, and die-carrier, means for rotating the same at like angular speed, a stylus adapted to follow the irregularities of the pattern as the pattern is revolved, a cutting-tool adapted to engage with and work into the die-block, means for rotating the pattern and die carriers, at a variable speed, said means including a pair of cone-pulleys and a belt connecting same, and a means for shifting said belt including a cam and a device coacting with said cam to move the same,

4. In a metal-working machine, a cutting-tool, means to guide the same, a die-carrier, and means to revolve the same, and means to reduce the speed of rotation of said die-carrier as the cutter works away from the center of the die or increase the speed of rotation of said carrier as said cutter works toward the center of the die, said means including a swinging cam-bar, a driver therefor, and a variable-speed-changing device controlled by said cam-bar.

5. In an engraving-machine, a cutter, a stylus, means for supporting said cutter and stylus and causing the same to move correspondingly, pattern and die carriers, means for rotating the same, means for shifting the position of said cutter and stylus, and means to reduce the speed of rotation of said die-carrier as the cutter works away from the center of the die and vice versa, said means including a swinging cam, a driver therefor, and a variable-speed-changing device controlled by said cam.

6. In an engraving-machine, a cutter, a die-carrier, means for rotating the die-carrier, means for controlling the position of the cutter, a speed-controller for said die-carrier including a variable-speed mechanism, a swinging member connected thereto, a cam carried by said swinging member, and a driver for engaging with said cam to swing said member.

7. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier, a die-carrier and a shaft for rotating said carriers, a fast pulley and a slow pulley and means for engaging said shaft with either of said pulleys and means for automatically controlling the engagement between said shaft and either of said pulleys.

8. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier, a die-carrier and a shaft for rotating said carriers, a fast pulley, a slow pulley, a clutch member carried by the shaft and adapted to engage either the fast pulley or the slow pulley, and means for automatically controlling the movement of said clutch member whereby the speed of the carriers may be varied.

9. In a metal-working machine, a cutter, a stylus and means for carrying the same, a pattern-carrier, a tripper carried thereby, a die-carrier, a shaft for rotating said carriers, a slow pulley normally in engagement with said shaft, a fast pulley adapted to engage said shaft, but normally disengaged therefrom, means for engaging the shaft with said fast pulley, said means being controlled by said tripper.

10. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier, a die-carrier, and a shaft for rotating said carriers, a fast pulley and a slow pulley, a clutch member free to slide on the shaft and adapted to engage with either of said pulleys, a two-part lever in engagement with said clutch member, means for freeing one of said parts from said clutch member, and means for controlling both parts of the lever to move said clutch member into engagement with either of said pulleys.

11. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier and a die-carrier and a shaft for rotating said carriers, a fast pulley and a slow pulley, means for connecting either of the same with said shaft, and means for blocking out the said cutter and stylus during the period when the fast pulley is in engagement with said shaft.

12. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier and a die-carrier and a shaft for rotating said carriers, a fast pulley and a slow pulley, means for connecting either of the same with said shaft, and means for blocking out the said cutter and stylus during the period when the fast pulley is in engagement with said shaft, said means comprising a tilting latch located in the path of movement of the means for carrying said cutter and stylus.

13. In a metal-working machine, a cutter, a stylus, means for carrying the same, a pattern and a die-block, means for driving the same, means for causing the cutter and stylus to bear against and follow the design of the pattern and a controlling means for varying the speed of rotation of the pattern and die-block said controlling means comprising a swinging member, a cam controlling the same, connections between said member and the said pattern and die-block driving means, cone-pulleys, an endless belt movably mounted between said cone-pulleys and in connection with said member whereby by the position of said member the position of the belt is determined and the transmitted speed varied.

14. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier and a die-carrier and a shaft for rotating said carriers, a fast pulley and a slow pulley and a clutch member for engaging either of the same with said shaft, a sector and means for gradually swinging said sector, a pair of cone-pulleys, one of the same being in connection with the slow pulley, a transmitting-belt between said cone-pulleys, the position of said belt being determined by said sector, a second shaft rotated by the shaft driving said carriers, a cross-head carried thereby, a cam on said sector, said cross-head being in engagement with said cam through an extension, tripper-bars carried by said pattern-carrier, and means intermediate of said tripper-bars and said clutch member for transmitting movement from the former to the latter.

15. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier, a die-carrier, and a shaft for rotating said carriers simultaneously and at the same speed, a fast pulley, a slow pulley, and means for engaging said shaft with either of said pulleys whereby the speed of rotation of said carriers may be increased or diminished, a tripper-bar mounted on one of said carriers and controlling said means.

16. In a metal-working machine, a cutter and a stylus and a beam for carrying the same, a pattern-carrier and a die-carrier and means for rotating said carriers, a fast pulley and a slow pulley and means for transmitting power and speed of one of said pulleys or the other to the pattern and die carrier, and means for engaging with the beam to hold the cutter and stylus away from their work while the parts are being rotated by the fast pulley.

17. In a metal-working machine, a cutter and a stylus and a beam for carrying the same, a pattern-carrier and a die-carrier and means for rotating said carriers and means for abruptly accelerating or diminishing the speed of rotation of said carriers, and means for engaging the beam to hold the cutter and stylus away from their work while the rotation of the carrier is accelerated.

18. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier and a die-block carrier and means for rotating said carriers, means for moving the cutter and the stylus-carrying means simultaneously, means for varying the working speed of rotation of the cutter and the die-carrier relatively to each other, and means for automatically increasing the speed of rotation of the pattern and die carriers said means being operative when the cutter is performing no work.

19. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier and die-carrier and means for rotating said carriers, means for moving the cutter and stylus-carrying means simultaneously, and automatic means for abruptly increasing the speed of rotation of the die-carrier said means being operative when the cutter is performing no work.

20. In a metal-working machine, a cutter and a stylus and means for carrying the same, a pattern-carrier, a die-carrier, a shaft for rotating said carriers, means for gradually varying the speed of rotation of said shaft and other means including a shifting device for automatically and abruptly varying the speed of rotation of said shaft whereby the speed of rotation of the pattern and die carriers may be correspondingly varied either gradually or abruptly without interrupting the operation of the cutter.

21. In an engraving-machine, a plurality of oppositely-arranged rotatable cutters in axial alinement with movable means supporting said cutters, a stylus carried by said means for controlling the position thereof, said cutters working in opposite directions to simultaneously produce a force and a die.

22. In an engraving-machine, a pattern, a stylus, a universally-movable beam carrying said stylus, a cutter carried by said beam, a second universally-movable beam and a cutter carried thereby and a connection between said beams whereby motion from one beam is imparted to the other, said cutters being arranged in axial alinement and working in opposite directions to simultaneously produce a die and a force.

23. In a metal-working machine, a pattern-carrier, a plurality of cutter-carrying beams mounted on opposite sides of the machine, one end of each beam being mounted in a universal joint, the other end of each beam being supported by a suitable arm-head or the like, a cutter carried by each of said beams, and a stylus carried by one of said beams and means to cause both cutters to move in harmony with the stylus.

24. In a metal-working machine, a cutter and a stylus carried by a suitable beam, a rotatable die-carrying member and a rotatable pattern-carrying member, means to normally cause the stylus to bear against the pattern and the cutter to bear against the die-block, tripper-bars carried by the pattern-carrier, a lever controlled thereby and in turn controlling a clutch member feathered upon a shaft in turn connected with the pat-

tern-carrier and the die-carrier, a fast and a slow pulley located in the path of movement of the clutch member and adapted to be engaged thereby, a latch for blocking out the cutter-carrying device, said latch being controlled by said tripper-bars.

25. In a machine of the character described, a rotatable pattern-carrier and a rotatable die-carrier, a stylus and cutter, a pivotally-mounted beam supporting said stylus and a cutter, curved tripper-bars carried by one of said carriers the curve of said bars being substantially concentric with the pivotal center of said beam.

26. In a machine of the character described, a pattern-carrier and a die-carrier, a stylus and a cutter, a pivotally-mounted beam supporting said stylus and cutter, adjustably-mounted tripper-bars carried by one of said carriers, the curve of said bars being substantially concentric with the pivotal center of said beam.

27. In an engraving-machine, a cutter, a stylus, and means for carrying the same, a pattern-carrier, a die-carrier, a tripping device carried by one of said carriers, a shaft for rotating said carriers, a slow pulley normally in engagement with said shaft, a fast pulley, adapted to engage said shaft but normally disengaged therefrom, means for engaging the shaft with said fast pulley, said means being controlled by said tripping device.

28. In an engraving-machine in combination, a cutter and a stylus and means for carrying the pattern and die carriers and means for rotating the carriers, automatic means for abruptly accelerating or diminishing the speed of rotation of said carriers and means to automatically and positively hold the cutter away from the block on the die-carrier during the period of accelerated rotation.

29. In an engraving-machine, a cutter and a stylus and means for carrying the same, pattern and die carriers and means for abruptly accelerating the speed of rotation of said carriers, means for positively elevating said cutter and stylus and means for blocking out the cutter to hold it away from its work during the period of accelerated rotation of said carriers.

30. In a metal-working machine, a pattern-carrier and a die-carrier, a stylus and a cutter, means for raising said stylus and cutter and means holding them to their work respectively, means for varying the speed of rotation of the pattern and die carriers, said means comprising a pair of cone-pulleys, a belt for transmitting speed from one pulley to the other, a belt-shifter and a hinged member, a cam-bar carried thereby, said cam-bar and hinged member being movable by the rotation of the pattern or die carrier, the said member being connected to said belt-shifting device through a suitable flexible medium.

31. In a machine of the character described, a rotatable pattern and die carrier, a beam pivotally mounted at one end and mounted upon anti-friction-bearings at the outer end in a device whereby said outer end can be elevated or depressed, means for elevating or depressing said device controlled by the rotation of the pattern or die carrier, a cam-actuator carried by said beam-supporting device, a speed-controller, a cam constituting one of the parts of said controller and engaged by said actuator.

32. In a machine of the character described, a pattern and die carrier, a stylus and cutter, a beam supporting the same, cross-head supporting one end of said beam, a threaded shaft for elevating or depressing said cross-head, and a worm-wheel on said shaft, a shaft having an endless screw meshing with said worm-gear, a latch for holding the same in operative position, said latch being controlled by the position of said cross-head, and means to disengage said endless screw from said gear when said latch is tripped.

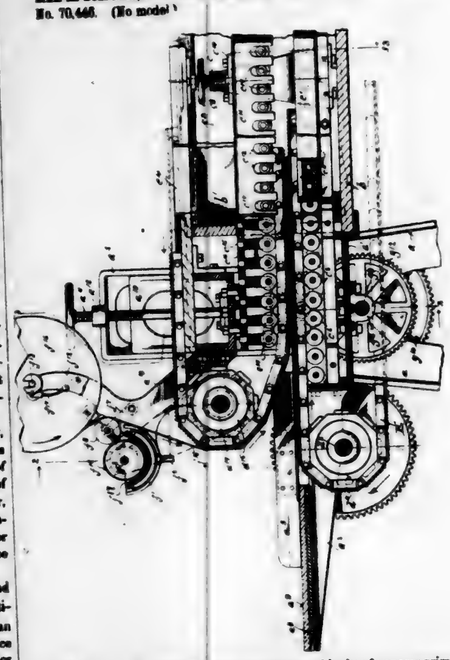
33. In a machine of the character described, means for carrying a pattern and a block in which a reproduction of the pattern is to be formed, a cutter, means for varying the speed of rotation of the pattern and block relatively to the speed of rotation of the cutter, said means comprising a hinged arm carrying a cam and means for bearing against the cam to swing said arm which in turn operates the variable-speed mechanism.

34. In a machine of the character described, a revolvable pattern-carrier, and a revolvable die-block carrier, and means for abruptly varying the speed of said carriers comprising a pulley and means for rotating the same, said pulley being connected by means of a pawl and ratchet with the shaft for driving said carriers, a clutch member feathered upon said shaft and means for shifting the same, a second pulley being in the line of action of said clutch member and adapted to be engaged thereby, and means for rotating said second pulley at a higher speed than said first-mentioned pulley engaging the same, and thereby increasing the speed of said shaft.

35. In an engraving-machine, pattern and die carriers, a stylus and cutter, means for carrying the same comprising a beam hinged at one end and supported at the other end by a yoke or bracket, a vertically-movable cross-head supporting said yoke and adjustable connections between said beam and yoke to vary the center height of the cutter and stylus independent of any adjustment of the cross-head.

36. In a metal-working machine, pattern and die carriers, a stylus and a cutter, means for supporting said stylus and cutter comprising a beam supported at one end so as to swing universally and supported at the other end by a vertically-moving yoke, and a blocking-out device comprising a lever one end of which is adapted to project into the path of movement of the swinging end of the beam, and means for controlling said blocking-out lever.

709,864. APPARATUS FOR EDGE-UNITING VENEERS. WILLIAM M. BOEHRINGE, Fort Washington, Wis. Filed Aug. 1, 1901. Serial No. 70,468. (No model.)



Claim.—1. In a device for edge-uniting two blanks of veneer or similar material, a two-part endless conveyer for carrying said blanks through said device, rollers tending to force one of said blanks at an angle to the line of travel of said conveyer and means adapted to act in conjunction with said conveyer for placing a strip of adhesive material above the joint between said blanks, substantially as described.

2. In a device for edge-uniting two blanks of veneer or similar material, a conveyer comprising two endless portions between which said blanks will be placed and by means of which they will be carried through said device, rollers arranged to force one of said blanks toward the other at an angle to the line of travel of said conveyer, mechanism for driving said conveyer and said rollers in unison, in combination with a supply of paper or fabric, and a glue-distributing device, substantially as described.

3. In a device for edge-uniting two blanks of veneer or similar material, a conveyer comprising two endless portions, a roller-way adapted to support one of said portions throughout a portion of its length, rollers mounted so as to yieldingly bear on the other portion throughout a portion of its length, said rollers tending to keep the adjacent faces of said portions in contact one with the other, said conveyer adapted when two blanks of veneer are placed in said device to grip said blanks adjacent to their abutting edges, means tending to force one of said blanks in close contact with the other at an angle to the line of travel of said conveyer, a glue-distributing roller, a source of supply of paper or fabric arranged so that said fabric may contact with said glue-distributing roller and be guided and placed over the joint between said blanks by means of one portion of said conveyer, substantially as described.

4. In a device for edge-uniting two blanks of veneer or similar material, means for carrying said blanks in one direction, mechanism tending to force one of said blanks at an angle to the line of travel of said means and a distributer for placing a strip of adhesive material above the joint between said blanks.

5. In a device for edge-uniting two blanks of veneer or similar material, a conveyer adapted to grip said blanks adjacent to their abutting edges and to carry the same through said device, means tending to force one of said blanks toward the other or at an angle to the line of travel of the conveyer, and mechanism acting in conjunction with said conveyer for placing a strip of adhesive material on said blanks over their abutting edges.

6. In a device for edge-uniting two blanks of veneer or similar material, a conveyer comprising two endless portions between which the two blanks to be joined will be fed and by which they will be carried through said device, rollers arranged so as to force one of said blanks toward the other or at an angle to the line of travel of said conveyer and a source of supply of adhesive material situated so that said material will be carried by one of the portions of said conveyer and placed on said blanks above the joint between them, substantially as described.

7. In a device for edge-uniting two blanks of veneer or similar material, means tending to force said blanks in close contact with each other, a housing and mechanism moving in the direction of the length of the joint between said blanks adapted to hold said blanks in close contact and convey the same through said housing, substantially as described.

8. In a device for edge-uniting two blanks of veneer or similar material, means tending to force said blanks together, a housing and a conveyer moving longitudinally of the abutting edges of said blanks adapted to hold said blanks in close contact and convey the same through said housing, substantially as described.

9. In a device for edge-uniting two blanks of veneer or similar material, rollers tending to force one of said blanks toward the other, mechanism moving in the direction of the length of the joint between said blanks adapted to hold the same in close contact and convey them through said housing in combination with mechanism working in conjunction with said conveying means for placing a strip of adhesive material on said blanks above their abutting edges, substantially as described.

10. In a device for edge-uniting two blanks of veneer or similar material, a table on which said blanks are placed, means for gripping said blanks simultaneously and imparting movement thereto, mechanism tending to force one of said blanks toward the other or out of the line of movement given by said means, a supply of adhesive material and a distributer acting in conjunction with said means for placing said adhesive material on said blanks above the joint between them, substantially as described.

11. In a device for edge-uniting two blanks of veneer or similar material, a table or support upon which said blanks are placed side by side, a moving bed or conveyer, a press adapted to move in unison with said bed, said press and said bed each adapted to grip both of said blanks simultaneously and to carry the same along said bed, means located at one side of said bed adapted to contact with one of said blanks and force the same toward the other, said bed and said press being formed so as to hold said blanks in close contact, one with the other, a source of supply of narrow paper or other suitable material, a device for distributing glue to said paper or other material, said material being adapted after the end thereof has been placed on said blanks above their abutting edges being distributed on the succeeding blanks to be fed into said device by means of said press, and mechanism for moving said bed, substantially as described.

12. In a device for edge-uniting two blanks of veneer or similar material, a conveyer comprising an endless bed, and means for holding the blanks on said bed, a table on which said blanks are placed, said table being provided with an opening through which said bed moves, rollers arranged back of said table at one side of said bed with which said blanks in the movement given to them by said bed are adapted to contact, said rollers being arranged so as to force said blank toward other blanks, means operating in conjunction with said conveyer for placing a strip of adhesive material on the succeeding blanks over their abutting edges after said adhesive material has been placed on said first-mentioned blanks above their abutting edges, and means for moving said conveyer, substantially as described.

13. In a device for edge-uniting two blanks of veneer or similar material, a conveyer for said blanks, rollers standing at right angles to the line of travel of said conveyer between which one of said blanks is adapted to pass, rollers standing at acute angles to the line of travel of said conveyer between which the other of said blanks is adapted to pass, a housing through which said conveyer passes and means for heating said housing.

14. In a device for edge-uniting two blanks of veneer or similar material, a conveyer for said blanks, upper and lower rollers standing at right angles to the line of travel of said conveyer between which one of said blanks is adapted to pass, means tending to yieldingly hold the upper rollers in contact with said blank, upper and lower rollers standing at acute angles to the line of travel of said conveyer between which the other of said blanks is adapted to pass, means yieldingly holding the upper of said last-mentioned rollers in contact with said last-mentioned blank and mechanism for driving said conveyer and the lower of said rollers at the same speed.

15. In a device for edge-uniting two blanks of veneer or similar material, a conveyer moving longitudinally of the abutting edges of said blanks, means tending to force said blanks together and a distributer acting in conjunction with said conveyer for placing a strip of adhesive material above the abutting edges of said blanks.

16. In a device for edge-uniting two blanks of veneer or similar material, a two-part endless-chain conveyer for conveying said blanks through the device, one chain adapted to support said blanks and one chain adapted to bear on the upper surfaces of said blanks; the veneer-contacting faces of one of said chains formed with sharp projections for penetrating said veneer to hold said veneer from movement laterally of said chain; the other of said chains being formed with recesses to accommodate said projections when no veneer lies between said chains.

17. In a device for edge-uniting two blanks of veneer or similar material, a two-part endless conveyer moving in the direction of the length of the joint between said blanks adapted to grip said blanks and convey them through said device and rollers arranged at one side of said conveyer to force one of said blanks toward the other.

18. In a device for edge-uniting two blanks of veneer or similar material, a conveyer moving in the direction of the length of the joint between said blanks for carrying said blanks through said device, a roller arranged at one side of the conveyer adapted to contact with one of said blanks and force it toward the other blank and protruding members on said conveyer for holding said blanks in close contact one with the other.

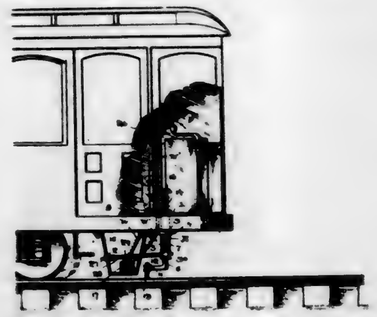
19. In a device for edge-uniting two blanks of veneer or similar material, a two-part endless conveyer moving longitudinally of the abutting edges of said blanks, moving means tending to force said blanks together and mechanism acting in conjunction with said conveyer for placing a strip of adhesive material above the abutting edges of said blanks.

20. In a device for edge-uniting two blanks of veneer or similar material, rollers tending to force said blanks together, a conveyer moving longitudinally of the abutting edges of said blanks for carrying the same through said device and means on said conveyer for preventing said blanks after they have been forced together from separating.

21. In a device for edge-uniting two blanks of veneer or similar material, means tending to force said blanks together, a conveyer moving longitudinally of the abutting edges of said blanks for carrying the same through said device and protruding members on said conveyer adapted to hold said blanks in close contact one with the other.

22. In a device for edge-uniting two blanks of veneer or similar material, rollers arranged to force said blanks together, two endless chains forming a conveyer and having their adjacent faces moving longitudinally of the abutting edges of said blanks, a rigid roller-way for one of said chains and a yielding roller-way for the other of said chains for yieldingly forcing said last-mentioned chain toward the other.

709,865. RAILWAY-SWITCH-OPERATING DEVICE. JAMES C BOOTH, Monessen, Pa. Filed May 14, 1902. Serial No. 107,210. (No model.)



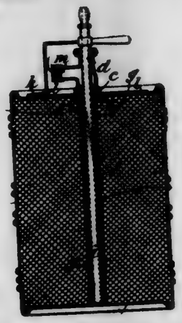
Claim.—1. In a switch-operating device, the combination with a laterally-movable switch-point, a vertically-movable shaft on the car, a plow carried by the shaft to engage the switch-point on either side, an electric circuit, magnets interposed in the circuit, an armature-lever actuated by the magnets and connected to the said shaft, and means on the car to make and break the circuit.

2. In a switch-operating device, the combination with the switch-rails, of a cross-bar uniting their free ends, a flanged bed-plate arranged and secured in the road-bed, a tapering switch-point movably arranged on said bed-plate and pivotally secured to said cross-bar, a hanger secured to the car, an electric circuit, electromagnets in the circuit and supported on the hanger, a vertically-movable shaft, a plow carried by the shaft and adapted to engage between the switch-point and the flanges of the bed-

plate, an armature-lever pivotally supported by the hanger and connected to the vertically-movable shaft, and means to make and break the circuit.

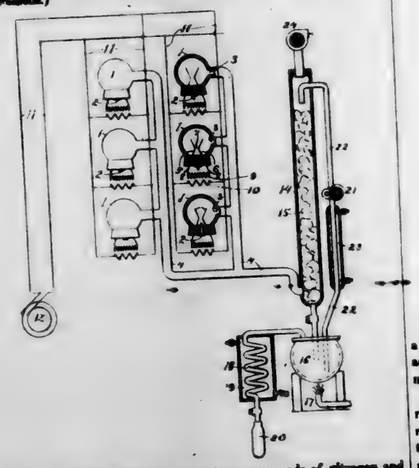
3. A device for throwing a switch from a car, comprising a vertically-movable shaft, a plow carried by the shaft, means to lift the shaft after its downward movement, a hanger fastened to the car, an electric circuit, magnets in the circuit, an armature-lever pivotally supported by the hanger, an insulated sleeve on said shaft and connected to the armature, and means on the car to make and break the circuit.

709,866. CARBURETER. EDOUARD BOURLARD-PEAUCHE, Angoulême, France. Filed Mar. 28, 1901. Renewed Aug. 26, 1902. Serial No. 121,095. (No model.)



Claim.—A carbureter comprising a receptacle completely filled with porous material adapted to retain hydrocarbons and which is pervious to the passage of air to form a combustible mixture, and a cock consisting of two concentric tubes, the outer one being stationary and having a helicoidal opening and the inner one forming the rotating plug and having a straight groove, the crossing of which with the helicoidal opening determines the level of the orifice, whereby said level can be varied by the turning of one tube relatively to the other.

709,867. PROCESS OF MANUFACTURING NITROGEN COMPOUNDS FROM ATMOSPHERIC NITROGEN. CHARLES S. BRADLEY and DURRETT R. LOVEJOY, New York, N. Y., assignors, by mesne assignments, to Atmospheric Products Company, Niagara Falls, N. Y., a Corporation of New York. Filed Mar. 9, 1900. Serial No. 8,008. (No specimens.)



Claim.—1. The process of procuring compounds of nitrogen and oxygen, consisting in exposing to the action of an electric arc, a mixture of nitrogen and oxygen and forcing the said mixture through the space containing the arc of minimum volume in sufficient volume, and with sufficient rapidity of removal, to carry away the nitrous products from the arc and substantially prevent dissociation.

2. The process of producing compounds of nitrogen and oxygen, consisting in establishing in a mixture of nitrogen and oxygen, an electric current in the form of an arc of minimum volume, and maintaining such arc at the minimum volume sufficient to prevent its breaking.

3. The process of producing compounds of nitrogen and oxygen, consisting in establishing in a mixture of nitrogen and oxygen an electric current in the form of an arc of minimum volume, and repeatedly interrupting and reëstablishing such arc.

4. The process of producing compounds of nitrogen and oxygen consisting in repeatedly establishing in a mixture of nitrogen and oxygen, an electric current in the form of an arc of minimum volume, elongating said arc and interrupting same.

5. The process of producing compounds of nitrogen and oxygen, consisting in removing from atmospheric air substantially all moisture contained therein, then exposing the dried air to the action of the electric arc, separating the resulting nitrous products as anhydrous oxids of nitrogen from the unaltered air, and discharging such unaltered air.

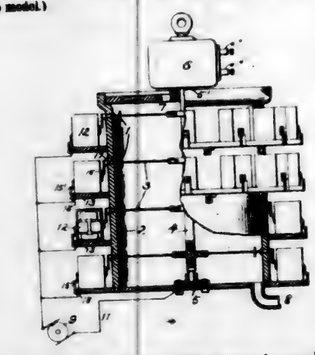
6. The process of producing compounds of nitrogen and oxygen, consisting in removing the moisture from air by cooling, subjecting the dried air to the action of the electric arc, cooling the air to remove by condensation the nitrous products, and separating such condensed products.

7. The process of producing compounds of nitrogen and oxygen, consisting in exposing a mixture of the gases to the action of an interrupted current in an electric circuit, and setting up in such circuit by the inductive effect of such interrupted current, induced counter electromotive forces resisting rapid increase of current.

8. The process of producing compounds of nitrogen and oxygen, consisting in establishing in a mixture of nitrogen and oxygen, an electric current in the form of an arc of minimum volume, elongating such arc with sufficient rapidity to prevent any substantial increase of quantity of current passing, and, by such elongation, breaking such arc before it passes into a spark.

9. The process of producing compounds of nitrogen and oxygen, consisting in exposing air to the action of the electric arc, then cooling the mixed gases sufficiently to condense the resulting nitrogen tetroxid, separating and collecting such nitrogen tetroxid, then further cooling the remaining gases to condense the nitrogen trioxid and separating and collecting the said nitrogen trioxid.

709,868. APPARATUS FOR SUBJECTING GASES TO HIGH-TENSION DISCHARGES. CHARLES S. BRADLEY, New York, and DURRETT R. LOVEJOY, Niagara Falls, N. Y., assignors, by mesne assignments, to Atmospheric Products Company, Niagara Falls, N. Y., a Corporation of New York. Original application filed Mar. 9, 1900, Serial No. 8,008. Divided and this application filed Aug. 29, 1901. Serial No. 73,674. (No model.)



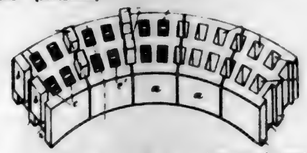
Claim.—1. The combination with a high-tension supply-circuit and a plurality of discharge devices connected thereto in parallel, of inductance devices located in circuit with the respective discharge devices and means for subjecting gases to the action of the discharge devices.

2. The combination with a high-tension supply-circuit and a plurality of discharge devices connected thereto in parallel and comprising relatively movable terminals, of inductance devices located in circuit with the respective discharge devices and means for subjecting gases to the action of the discharge devices.

3. The combination of the containing vessel, fixed terminals arranged therein, the shaft rotatably mounted in said vessel and carrying movable terminals, means for passing gases through the vessel, induction devices connected in circuit with said fixed terminals, means for detachably supporting said induction devices on said vessel, and means for supplying high-tension current connected to the induction devices and the aforesaid shaft.

4. The combination of the containing vessel, fixed terminals arranged therein, the shaft rotatably mounted in said vessel and carrying movable terminals, means for passing gases through the vessel, induction devices connected in circuit with said fixed terminals, means for detachably supporting said induction devices on said vessel, means for detachably placing the induction devices in circuit when they are placed on their supporting means, and means for supplying high-tension current connected to the induction devices and the aforesaid shaft.

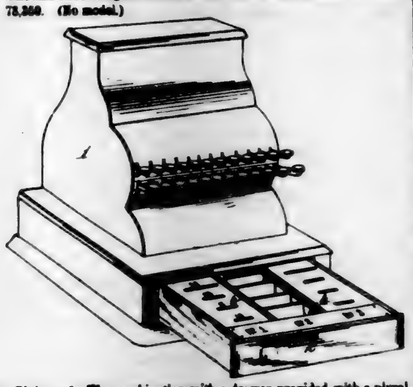
709,869. CHIMNEY OR OTHER CURVED FIREPROOF STRUCTURE. PAUL BRADBURN, Brooklyn, N. Y. Filed Mar. 3, 1902. Serial No. 96,871. (No model.)



Claim.—1. A chimney or similar curved fireproof structure composed of hollow fireproof blocks having arched faces and converging grooved sides, combined with key-bricks engaging the grooves of adjoining blocks, and filling-bricks set within the perforations of the blocks, substantially as specified.

2. The method of constructing a chimney or similar curved fireproof structure which consists in setting a circular course of grooved fireproof blocks, partly filling the grooves with mortar, and then driving key-bricks into the grooves to spread the blocks and to simultaneously fill the opening joints with the displaced mortar, substantially as specified.

709,870. TILL. CORNELIUS S. CLARK and JOSIAH T. JONES, Norfolk, Va.; said Clark assignor to said Jones. Filed Oct. 11, 1901. Serial No. 78,260. (No model.)



Claim.—1. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for independently locking all of said covers as long as said drawer remains closed, and means for independently releasing said covers after the drawer has been opened, substantially as described.

2. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for separately locking all of said covers independently of the movement of the drawer, and means operative only when the drawer is open for independently releasing said covers, substantially as described.

3. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for separately locking all of said covers, means for independently releasing said covers after the drawer has been opened, and means for automatically opening said covers when they are released, substantially as described.

4. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for separately locking all of said covers, and means for separately releasing any number of said covers after the drawer has been opened, substantially as described.

5. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for separately locking all of said covers, means for independently releasing said covers after the drawer has been opened, and means for preventing access to the releasing mechanism while the drawer is closed, substantially as described.

6. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, independent permutation-locks for separately locking said covers, and means for preventing access to said locks until the drawer is opened, substantially as described.

7. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, independent permutation-locks set on different combinations for separately locking said covers, and means for preventing access to said locks until the drawer is opened, substantially as described.

8. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, independent permutation-locks set on different combinations for separately locking said covers, means for locking the locks when the drawer is closed, and means for preventing access to said locks until the drawer is opened, substantially as described.

9. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, independent permutation-locks set on different combinations for separately locking said covers, means for preventing access to said locks until the drawer is opened, and means for closing and locking said covers when the drawer is closed, substantially as described.

10. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for separately locking all of said covers, means for releasing any one of said covers after the drawer has been opened, means for automatically opening the covers when they are released, and means for closing the covers when the drawer is closed, substantially as described.

11. The combination with a drawer provided with a plurality of separate compartments, of independent covers for said compartments, means for independently locking all of said covers, means for releasing any of said covers after the drawer has been opened, means for automatically opening the covers when they are released, means for automatically closing the covers when the drawer is closed, and means for preventing access to said releasing mechanism when the drawer is closed, substantially as described.

12. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments, means for independently locking all of said covers, and means for releasing any of said covers after the drawer has been opened, substantially as described.

13. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments, means for independently locking all of said covers, means for releasing any of said covers after the drawer has been opened, and means for automatically sliding the covers from off the compartments when said covers are released, substantially as described.

14. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments, means for independently locking all of said covers, means for releasing any of said covers after the drawer has been opened, means for automatically sliding the covers from off the compartments when said covers are released, and means for preventing access to the releasing mechanism until the drawer is opened, substantially as described.

15. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments, means for independently locking all of said covers, means for releasing any of said covers after the drawer has been opened, and springs arranged to draw the covers from off the compartments when said covers are released, substantially as described.

16. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments, means for independently locking all of said covers, means for releasing any of said covers after the drawer has been opened, springs arranged to draw the covers from off the compartments when said covers are released, and means for compressing the springs when the drawer is closed, substantially as described.

17. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments, means for independently locking all of said covers, means for releasing any of said covers after the drawer has been opened, springs arranged to draw the covers from off the compartments when said covers are released, and means for yieldingly arresting the movement of the covers

when the latter are retracted from over the compartments, substantially as described.

18. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments each having depending flanges at their opposite ends, longitudinal rods passing through said flanges and on which said covers are arranged to travel, springs interposed between the rear of the drawer and the rear flanges of the covers and operating to retract the covers when the latter are released, means for independently locking said covers, and means for releasing any of the covers after the drawer has been opened, substantially as described.

19. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments each having depending flanges at their opposite ends, longitudinal rods passing through said flanges and on which the covers are arranged to slide, springs interposed between the rear of the drawer and the rear flanges of the covers and operating to retract the covers when the latter are released, fixed stops arranged to arrest the movement of the covers when the latter are retracted, means for independently locking said covers, and means for releasing any of the covers after the drawer has been operated substantially as described.

20. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments each having depending flanges at their opposite ends, longitudinal tubes passing through said flanges and fixed in the opposite ends of the drawer, stationary rods fixed at their rear ends in rear of the drawer and telescoping at their forward ends in said tubes, means for independently locking the covers, means for releasing any of the covers after the drawer has been opened, and springs arranged to retract the sliding covers from over the compartments when said covers are released, substantially as described.

21. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments each having a depending slotted flange, latches carried by the drawer for engaging said slotted flanges and holding the covers closed, and means for independently releasing said latches at will after the drawer has been opened, substantially as described.

22. The combination with a drawer provided with a plurality of separate compartments, of independent sliding covers for said compartments each having depending slotted flanges, latches carried by the drawer arranged to automatically engage said slotted flanges and lock the covers when the drawer is closed, means for independently releasing said catches at will after the drawer has been opened, and means for automatically retracting said covers from over the compartments when the covers are released, substantially as described.

709,871. TRAP. JAMES A. CLEKINS, St. Louis, Mo., assignor to Louis Stoltz and Bertha Clukies, St. Louis, Mo. Filed Nov. 25, 1901. Serial No. 83,498. (No model.)

Claim.—1. In a trap, the combination of a pipe carrying a ring, a bowl provided with a horn, a plate connected to said horn and seated on said ring, said plate held in position on said ring by said pipe, substantially as described.

2. In a device of the character described, a bowl provided with a horn, a plate formed integral with said horn, a pipe carrying a resilient ring, said plate seated on said ring and held in position by said pipe, and means for expanding said ring, substantially as described.

3. In a trap, the combination of a pipe, provided in its upper end with an annular groove, a ring seated in said groove, a bowl provided at its lower end with a horn, a plate connected to said horn, said plate seated on said ring and held in position by the turned edge of said pipe, substantially as described.

4. In a trap, the combination of a pipe, provided with a flange having reduced edges, a ring seated in said pipe, a bowl, a plate having reduced edges connected to said bowl and seated on said ring, said plate being held in position by said flange, and means for expanding said ring, substantially as described.

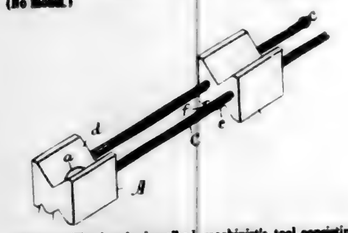
5. In a trap, the combination of a pipe provided with an annular groove, a ring within said groove, a bowl provided at its lower portion with a horn, a plate having reduced downwardly-deflected edges connected to said horn, said plate positioned on said ring, said pipe provided with reduced edges adapted to overlap said plate and hold same in position, and means adapted to force said ring against said plate, substantially as described.

6. In a trap, the combination of a pipe carrying a ring, a bowl provided with a horn, means connected to said horn and seated on said ring, said means held in position on said ring by said pipe, and means connected to said pipe for raising the latter whereby the said ring is compressed by engagement with said first-named means, substantially as described.

709,872. MEANS FOR ATTACHING BOWLS TO THE SLABS OF WASHSTANDS. JAMES A. CLEKINS, St. Louis, Mo., assignor to Louis Stoltz and Bertha Clukies, St. Louis, Mo. Filed Nov. 25, 1901. Serial No. 83,500. (No model.)

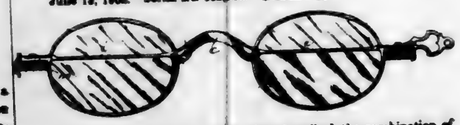
Claim.—The combination of a slab, a bowl having a flange, angle-irons, shells gripping said slab, bolts cooperating with said shells, a collar surrounding the drain-pipe and supporting-straps engaging said collar and fastened to said bolts, substantially as described.

709,873. MACHINIST'S V-BLOCK. ELMER M. COBB and EUGENE A. SPAULDING, Portland, Me. Filed Dec. 19, 1901. Serial No. 86,484. (No model.)



Claim.—The herein-described machinist's tool consisting of a pair of V-blocks having their notches in line with each other, and a pair of guide-rods secured to one of said blocks and passing through the other block and upon which it is adapted to slide.

709,874. SPECTACLES. MOSES H. COHEN, Marseilles, Ill. Filed June 19, 1902. Serial No. 112,208. (No model.)



Claim.—1. In spectacles of the class described, the combination of a pair of main lenses, a nose-bridge connecting such lenses, an outer shoulder for each lens attached thereto and extending outward and backward from the outer end thereof, a detached pair of supplementary lenses provided with a bridge extending over the nose-bridge and connecting such supplementary lenses, and a shoulder attached to the outer ends of such supplementary lenses and extending outward over the outer shoulders of the main lenses, substantially as described.

2. In spectacles of the class described, the combination of a pair of main lenses, a nose-bridge extending upward and backward from the inner ends of such lenses and in operative connection therewith, a shoulder attached to and extending outward and backward from the outer end of each lens, a detached pair of supplementary lenses removably mounted back of the main lenses, a bridge attached to the supplementary lenses connecting them and extending over the nose-bridge of the main lenses, and a shoulder attached to and extending outward from the outer end of each supplementary lens and having a downwardly and inwardly extending portion adapted to yieldingly engage the shoulder on the adjacent main lens, substantially as described.

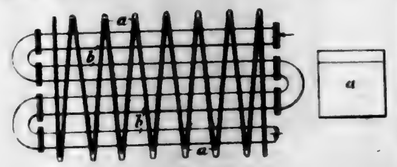
3. In spectacles of the class described, the combination of a pair of oval lenses provided with a nose-bridge operatively connecting the inner ends thereof and extending backwardly and upwardly, a detached pair of semi-oval lenses removably mounted back of the main lenses having their top edge extending horizontally central of the main lenses, a bridge extending over the nose-bridge of the oval lenses and connecting the supplementary lenses, and means for yieldingly and removably connecting the supplementary lenses with the oval lenses, substantially as described.

4. In spectacles of the class described, the combination of a pair of main lenses, a pair of rims in which such lenses are mounted provided with a nose-bridge extending from and connecting the inner ends of such rims and thereby the lenses and forming a main frame, a shoulder on the outer end of each rim extending outwardly and backwardly therefrom, a bow pivotally mounted in each of the shoulders, a supplementary frame consisting of a pair of rims and a connecting-bridge removably mounted back of the main lenses, a detached pair of supplementary lenses in such frame, a connecting-bridge in the supplementary frame extending over the nose-bridge of the main lenses and connecting the rims of the supplementary frame and thereby the supplementary lenses, and a shoulder upon the outer end of each rim of the supplementary frame extending outward over the shoulders of the main frame and resting removably thereon, substantially as described.

5. In spectacles of the class described, the combination of a main frame consisting of a pair of rims and a nose-bridge connecting the inner ends of such rims, a shoulder extending outwardly and backwardly from the outer end of each rim, a bow pivotally mounted in each shoulder, a pair of oval lenses mounted in such main frame, a supplementary frame removably mounted back of the main frame having shoulders extending outward from the outer ends thereof over and resting removably upon the shoulders of the main frame, and a pair of substantially semi-oval lenses mounted in such supplementary frame and having their top edges extending horizontally centrally of the oval lenses, substantially as described.

6. In spectacles of the class described, the combination of a main frame having a nose-bridge extending backward and upward therefrom and provided with end shoulders extending outward and backward from the outer ends thereof, a pair of lenses mounted in such main frame, a detached supplementary frame consisting of a pair of rims having a connecting-bridge adapted to extend over the nose-bridge of the main frame, a pair of shoulders extending outward longitudinally of the supplementary frame over the shoulders of the main frame, each having a downwardly-extending hook portion for engaging a shoulder of the main frame, and a pair of semi-oval lenses mounted in the supplementary frame, substantially as described.

709,875. HEATING OR COOLING PIPE. RUDOLF OSSENKOPP, Magdeburg-Sudenburg, Germany. Filed May 5, 1902. Serial No. 106,044. (No model.)

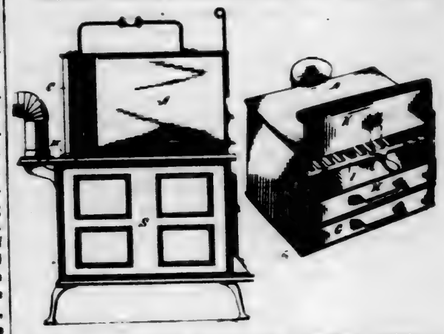


Claim.—1. The combination with a pipe for conveying a heating or cooling medium, of an integral radiating-plate bent or folded in a zigzag manner and having each of its folds provided with an aperture through which said pipe extends, substantially as described.

2. The combination with a pipe for conveying a heating or cooling medium, of an integral radiating-plate bent or folded in a zigzag manner and having each of its folds provided with an aperture through which said pipe extends, the said folds of said radiating-plates being rigidly connected with said pipe by metallic connection, substantially as described.

3. The combination with a plurality of pipes for conducting a heating or cooling medium, of a radiating-plate bent or folded in a zigzag manner, each of the folds of said plate being provided with an aperture for each of said pipes, and each of said pipes extending through all the folds of said plate, substantially as described.

709,876. SUMMER COOK-STOVE. CHARLES E. COOKE, Kansas City, Mo. Filed May 31, 1901. Serial No. 62,589. (No model.)

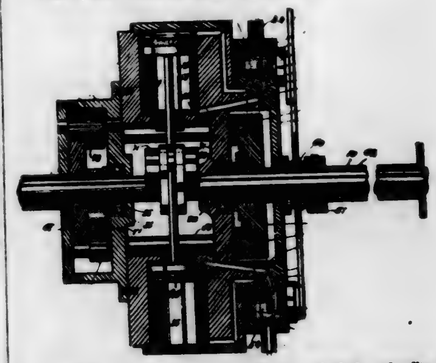


Claim.—1. A portable stove or broiler as described, consisting essentially of the substantially cubical body having drawer-slides, a down-flue outside said body and opening into the same through the rear wall, an ash-pan and a charcoal-pan above the same, and a sliding door extending downward at the front of the stove-body to the top of the upper pan when closed, all substantially as described.

2. In a portable stove, the rectangular body having a rear down-flue, slideways arranged on the inner sides of said body, an ash-pan drawer and a charcoal-drawer arranged to fit and move on the lower slideways having the upper slideways for a gridiron, and a sliding front to close downward in suitable channels at the front of the body, all combined.

3. In a portable auxiliary stove, the sheet-metal casing having a rear down-flue, and a handle-bar attached to the top of the down-flue and to top of the body proper, and serving as a brace and handle, all combined substantially as described.

709,877. MOTOR. CHARLES J. OSBURN, Jersey City, N. J. Filed Nov. 14, 1901. Serial No. 82,330. (No model.)



Claim.—1. A motor comprising a fixed crank-shaft, a plurality of cylinders mounted to rotate around the crank-shaft, pistons in the cylinders having connection with the crank of the crank-shaft, a two-section driving-shaft, and compounding-gear connections between the driving-shaft sections and the cylinders, substantially as specified.

2. A motor, comprising a fixed crank-shaft, a cylinder-body mounted to rotate around the crank-shaft and having a plurality of cylinders arranged one cylinder opposite another, pistons arranged in the cylinders, rod connections between opposite pistons, yoke members arranged in said rods and engaging with the crank, a shaft movable around the crank-shaft, and fixed gear connections between the movable shaft and the motor-body, substantially as specified.

3. A motor, comprising a fixed crank-shaft, a cylinder-body mounted to rotate around said crank-shaft and having a plurality of cylinders arranged one cylinder opposite another, pistons for operating in the cylinders, rod connections between opposite pistons, yokes in said rod connections for engaging with the crank, a driving-shaft comprising tubular sections surrounding the crank-shaft, and driving connections between the motor-body and said tubular shaft-sections, substantially as specified.

4. A motor, comprising a fixed crank-shaft, a motor-body mounted to rotate relatively to the crank-shaft, the said body having a plurality of cylinders, pistons operating in the cylinders, rod connections between opposite pistons, yoke members in said rod connections for engaging with the crank, tubular driving-shaft members mounted to rotate on the crank-shaft, gear-wheels on said tubular shaft members, shafts carried by the body, pinions on said shafts for engaging with the gear-wheel on one of the tubular shaft members, pinions on the opposite ends of said shafts and pinion connections between said last-named pinions and the gear-wheel on the other of said tubular shaft members, substantially as specified.

5. A motor, comprising a fixed crank-shaft, a motor-body mounted to rotate on said shaft and having a series of cylinders, the cylinders being arranged in pairs, one cylinder opposite another, pistons for operating in the cylinders, opposite pistons being connected and having connection with the crank of the crank-shaft, ports leading into the outer and inner ends of the cylinders, a fixed port-plate having channels with which the respective inner and outer ports communicate, means for directing a motive agent into said channels and a driving-shaft having gear connection with the motor-body, substantially as specified.

6. A motor, comprising a fixed crank-shaft, a motor-body mounted to rotate on the shaft and having a series of cylinders, the said cylinders being arranged in pairs one cylinder opposite another, pistons operating in the cylinders, opposite pistons being connected and having connection with the crank of the crank-shaft, a driving-shaft gear connections between the driving-shaft and the motor-body, a fixed port-plate having two channels for communicating with ports leading to the inner and outer ends of the cylinders, a valve for controlling the inlet of steam to said channels, a valve for controlling the exhaust of steam from said channels, and means for simultaneously operating said valves, substantially as specified.

7. A motor, comprising a fixed crank-shaft, a motor-body mounted to rotate on the shaft and having a series of cylinders, the said cylinders being arranged in pairs one cylinder opposite another, pistons operating in the cylinders, opposite pistons being connected and having connection with the crank of the crank-shaft, a driving-shaft, gear connections between the driving-shaft and the motor-body, a fixed port-plate having two channels for communicating with ports leading to the inner and outer ends of the cylinders, a valve for controlling the inlet of steam through said channels, a valve for controlling the exhaust of steam from said channels, means for simultaneously operating said valves, and means for holding the port-plate yieldingly against the body of the motor, substantially as specified.

709,878. **MANUFACTURE OF RAIL-BONDS.** FRED H. DANIELS and HORACE W. WYMAN, Worcester, Mass. Filed Feb 7, 1902. Serial No. 92,958. (No model.)

Claim.—1. The herein-described method of making electrical conductors or bonds, consisting in forming the head with a cup-shaped central recess or depression and an open transverse slot or groove across the end over the recess, placing in said recess a ball or other expander of harder metal than the head, fitting the conducting-strands in the slot over the expander, and uniting said strands to the head and simultaneously closing the recess and causing the metal of the head to close around the expander by forging or welding.

2. The herein-described electrical conductor or bond, consisting of the head *a*, having a spreader or expander of harder metal inclosed in a central recess therein, and the conductor *b* united to the head by being forged or welded into an open groove extending transversely across head.

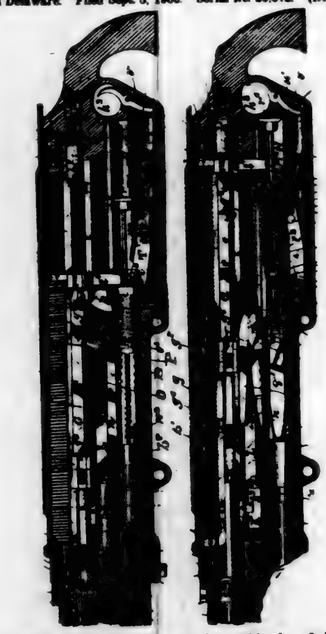
709,879. **GARMENT-SUPPORTER.** CALVIN A. DEARDORFF, Washington, D. C. Filed Oct. 30, 1901. Serial No. 80,857. (No model.)

Claim.—1. A garment-supporter of the class described, comprising a belt-loop member having a closed eye arranged intermediate the ends of the loop, and a safety-pin member having a closed eye in one arm thereof intermediate the ends of the pin, said eyes being interlocked to loosely connect the two members.

2. A garment-supporter of the class described, comprising an elongated belt-loop member formed of a single strand of wire having one bar thereof bent intermediate the ends of the loop to provide a closed eye, and a safety-pin member having one of its arms bent to provide a closed eye intermediate the ends of the pin, said eyes being interlocked to loosely connect the two members.

3. A garment-supporter of the class described, comprising a belt-loop member formed of a single strand of wire and having one of its bars bent intermediate the ends of the loop to provide a closed eye, said loop being split at one point and having reduced overlapping ends, and a safety-pin member provided with a closed eye intermediate the ends of the pin, the eyes of said members being interlocked.

709,880. **AUTOMATIC RAPID-FIRE GUN.** VICTOR P. DE KNIGHT, Washington, D. C., assignor, by direct and mesne assignments, to the Victor P. De Knight Gun Company, Washington, D. C., a Corporation of Delaware. Filed Sept. 5, 1900. Serial No. 29,072. (No model.)



Claim.—1. In a machine-gun, the combination of the receiver or cradle for the breech mechanism, the detachable wedge-block at the rear of the receiver, a top plate or cover hinged at one end and having a pendent lug at the other end thereof engaging a recess in the wedge-block, and a single fastening device securing said receiver, wedge-block and top plate together, substantially as described.

2. In a machine-gun, the combination with the breech mechanism, of the receiver or cradle therefor having the detachable safety or wedge block and the removable top plate hinged at one end and having a projection at the other end thereof occupying a recess in said wedge-block, and a fastening-pin inserted through the receiver-walls and the said wedge-block and projection, whereby the wedge-block and top plate are secured together and to the receiver, substantially as described.

3. In a machine-gun, the receiver or cradle containing the cartridge loading and firing mechanism, and having a longitudinal slot in its bottom, in combination with the trigger mechanism located below said bottom, and a detachable bottom plate inclosing the space occupied by said trigger mechanism outside of the receiver; whereby said trigger mechanism is housed underneath the receiver-bottom and access thereto is readily afforded by removing said bottom plate, substantially as described.

4. In a machine-gun, the combination with the operating mechanism, of the receiver or cradle therefor having the detachable wedge-block adapted to be slid down into place, and the trough-like plate or cover detachably secured to the under side of the receiver for housing a portion of the operative mechanism, said plate having a supporting-lug engaging a support on the under side of the receiver and being held in place by the wedge-block, and a spring constituting a portion of said operative mechanism bearing against said plate so as to actively force out said plate when the wedge-block is lifted and the plate disengaged from its support; substantially as described.

5. In a machine-gun, the combination with the operative mechanism, of the receiver or cradle therefor having the detachable wedge-block adapted to be slid down into place, and the removable top and bottom plates or covers, said bottom plate being secured in place by the wedge-block and adapted to be slid backward and detached from the receiver only when said wedge-block is raised, and said top plate being hinged to the receiver at one end and detachably secured thereto and to said wedge-block at the other end thereof so as to confine the wedge-block and through it the bottom plate in place by a single fastening device; substantially as described.

6. In a machine-gun, the receiver or cradle containing the cartridge loading and firing mechanism, and having a wedge-block adapted to be slid down into place to close its rear end, in combination with the trigger mechanism located below said bottom, and a detachable longitudinally-slidable bottom plate inclosing the space occupied by said trigger mechanism outside of the receiver; said bottom plate and receiver having co-acting engaging means for retaining said plate in a fixed position on the receiver and adapting it to be slid backward and removed only when the wedge-block is raised, substantially as described.

7. In a machine-gun, the combination with the breech portion and the barrel, of the water-jacket inclosing said barrel, and a storage tube or chamber inclosed within the water-jacket and having its open end accessible through an opening in said jacket; substantially as described.

8. In a machine-gun, the combination with the breech portion and barrel, and the water jacket inclosing said barrel, of a storage tube or chamber inclosed within said jacket and having its open end protruding through an opening in the forward end of the latter; said jacket having an interior projection or bracket for supporting the other end of said tube or chamber; substantially as described.

9. In a gas-operated rapid-fire gun, the combination of the barrel having a screw-threaded socket on one side with a port through the bottom thereof, a gas conduit or pipe having a transversely-apertured and screw-threaded head, a longitudinally-bored plug uniting said head and socket to provide communication between said gas-conduit and the bore of the barrel, and a plug or "choker" inserted through an aperture in the jacket and entering the aperture in said head; substantially as described.

10. In a gas-operated rapid-fire gun, the combination of a barrel having a screw-threaded socket on one side with a port through the bottom thereof, a gas-conduit having screw-threaded sockets formed on opposite sides thereof with ports therethrough, a hollow plug or coupling uniting one of the latter sockets with the socket on the barrel, and a plug or "choker" in the form of a set-screw protruding through the socket on the gas-conduit opposite said hollow plug into the bore of the gas-conduit; substantially as described.

11. In a gas-operated rapid-fire gun, the combination with the barrel, the gas-conduit communicating therewith in the rear of its muzzle and extending back to the operating parts of the gun, and the water-jacket inclosing said conduit and barrel, of the valve or choker in the form of a thumb-screw entered through an aperture in said jacket and having its end protruding into the bore of the gas-conduit; substantially as described.

12. In a gas-operated rapid-fire gun, a gas-conduit communicating with the bore of the gun-barrel at the forward part of the same, and a cylinder forming a continuation of said conduit and having an interior recess near its rear end and a port communicating with said recess to provide for the escape of spent gases and refuse from the conduit, in combination with a piston in said cylinder having a recessed terminal portion or reduced extension coincident with the recess in the cylinder in the normal position of the piston, and mechanism adapted to be operated by said piston, substantially as described.

13. In a gas-operated rapid-fire gun, a gas-conduit communicating with the bore of the gun-barrel at the forward part of the same, a cylinder compounded with said conduit, a plunger or piston in said cylinder, and mechanism adapted to be operated by said plunger; said cylinder having an interior annular recess near its rear end and a hollow plug communicating with a port leading from said recess to provide for the escape of gas and air from the conduit; substantially as described.

14. In combination with the gun-barrel, the water-jacket, the gas-conduit communicating with the forward portion of the barrel and extending back to the operating parts of the gun and having an annular recess therein, and a hollow plug entered through an aperture in said jacket and communicating with said recess, so as to provide for the escape of gas and refuse from the gas-conduit to without the gun; substantially as described.

15. In a gas-operated rapid-fire gun, the combination with the barrel and a gas-conduit connected to and communicating therewith rearwardly of its muzzle and extending back for cooperation with the breech mechanism, of a water-jacket inclosing said conduit and barrel, and a pair of set-screws entered through apertures in said jacket near its opposite ends into registering apertures in said conduit and adapted to prevent rotation or relative displacement of said jacket, conduit and connected barrel, one of said set-screws being adapted to control the gas-inlet to said conduit, and the other being in the form of a hollow plug through which spent gases may escape from the conduit; substantially as described.

16. In a gas-operated rapid-fire gun, a gas-conduit communicating with the barrel and having a cylinder and a piston working therein, said cylinder having an interior annular recess provided with a port for the escape of gas and refuse from the conduit, in combination with a reciprocatory actuator for the breech mechanism independent of the piston having a forward extension adapted to enter said conduit and to be backwardly impelled by the piston; substantially as described.

17. In a gas-operated rapid-fire gun, the combination of a gas-conduit communicating with the barrel at the forward part thereof and extending rearwardly therefrom, a plunger or piston working in a cylindrical portion of said conduit, a reciprocatory actuator for the breech mechanism movable independent of the plunger and adapted to be impelled in one direction by said plunger, and a single retractile spring arranged to act directly on the actuator in opposition to the impelling action of the plunger so as to store power which is exerted in impelling the actuator in the opposite direction; substantially as described.

18. In a machine-gun, the combination with the receiver or casing having the removable top plate and the reciprocatory actuator or slide inclosed therein, of an interposed spiral spring for advancing said actuator having one end secured to the top plate and its other end detachably connected with the actuator so that said spring may be detached from the actuator and removed with said top plate to permit access to the operating parts in said receiver; substantially as described.

19. In combination with the breech mechanism of a machine-gun, and a reciprocatory actuator therefor, a rocking cartridge depressing and pointing arm, a cam piece or wiper pivotally supported on said arm and extending into the path of movement of a part carried by the actuator, together with said part having an elongated contacting surface adapted to engage said wiper and thereby depress and hold the arm down when the actuator is moving in one direction; said wiper being adapted to yield by contact with said part when the actuator is moving in the opposite direction, substantially as described.

20. In combination with the breech mechanism of a machine-gun, and a reciprocatory actuator therefor, a rocking cartridge depressing and pointing arm, a spring-pressed cam piece or wiper pivotally supported on said arm and extending into the path of movement of a contacting portion carried by the actuator, so as to contact therewith when the latter is reciprocated, together with an elongated projection forming said contacting portion adapted to engage said wiper and thereby depress and hold said arm down when the actuator is moving in one direction; said wiper being adapted to yield by contact with said projection when the actuator is moving in the opposite direction, substantially as described.

21. In combination with the reciprocatory actuator for the breech mechanism, a pair of cartridge-extracting arms pivotally connected at their upper ends, and a spring secured on one arm having a free end bearing on the other arm and adapted to yieldingly force the pendent portions of the arms toward each other; substantially as described.

22. In a rapid-fire machine-gun, the combination with the reciprocatory actuator for the breech mechanism, of the rocking cartridge depressing arm or lever having a spring-pressed cam piece or wiper pivoted thereon with which an engaging part of the actuator contacts, on the forward movement of the latter, depressing the arm and directing the cartridge into the cartridge-chamber of the barrel; said cam-piece being adapted to yield or recede out of the path of said engaging part on the backward movement of said bar, so as not to affect the position of said arm, substantially as described.

23. The combination, in a machine-gun, of a receiver having openings in opposite sides and a passage-way between said openings for the passage of the cartridge-belt; a ledge at each side of said passage-way to support opposite ends of the cartridge, which ledges converge toward their inner ends, internal steps or shoulders at the terminal of said ledges to arrest the cartridge, one of said shoulders having an extension which is adapted to overlie and hold the cartridge down, means for drawing the

cartridge-belt through said passage-way to feed the cartridges successively against said shoulders and beneath said overhanging extension, and means for extracting the arrested cartridge from the belt; substantially as described.

24. In a rapid-fire machine-gun, the combination with the receiver, and the longitudinally-reciprocating actuator, and the reciprocatory feed-slide arranged to slide across the path of movement of said actuator to successively advance a cartridge into a passage-way through the receiver, of the vibratory lever for actuating said slide arranged substantially parallel with the actuator and having an extension loosely fitting a transverse slot or recess in the feed-slide, and means for actuating the lever by direct contact with the actuator; substantially as described.

25. In a rapid-fire machine-gun, a reciprocatory structure adapted to be actuated in one direction by force resulting from a discharge and advanced by a spring in the opposite direction; said structure comprising an actuator for receiving the direct impact of the retracting force and having abutment pieces or shoulders, and a breech-block having a bifurcated arm which embraces said actuator between the abutment-shoulders thereof, said breech-block being thus detachable from said actuator, and a sufficient space being provided between said abutment-shoulders to permit movement of the actuator independent of the breech-block; substantially as described.

26. In a rapid-fire machine-gun, a reciprocatory structure adapted to be actuated in one direction by force resulting from a discharge and advanced by a spring in the opposite direction; said structure comprising an actuator for receiving the direct impact of the retracting force and having abutment pieces or shoulders, and a breech-block having a bifurcated arm which embraces said actuator between the abutment-shoulders thereof, said breech-block being thus detachable from said actuator, and a sufficient space being provided between said abutment-shoulders to permit movement of the actuator independent of the breech-block, said actuator being operatively connected with means for feeding a belt of cartridges into the receiver, extracting them one by one, and loading and firing the extracted cartridges; substantially as described.

27. In a rapid-fire machine-gun, the combination of a breech-block, a spring-pressed hammer carried thereby, a locking-piece spring-pressed to lock the breech-block and having a rearwardly-extending heel, a sear pivoted concentrically with said locking-piece and having a rearwardly-extending heel confronting that of the latter, said sear being pressed to hammer-engaging position by a spring inferior to that which actuates the locking-piece, a wedge entered between said confronting heels and carried by a horizontally-disposed flexible rod or piece slidable through the rear end of the gun-casing, and means for manipulating said wedge; substantially as described.

28. In combination with the breech-block and spring-pressed hammer carried thereby, the concentrically-pivoted sear and breech-block lock arranged horizontally beneath the breech-block chamber and spring-pressed upward for locking said breech-block and hammer, respectively; said sear and lock having rearward confronting projections or heels, a horizontally-disposed wedge entered between said heels, and means for manipulating said wedge; substantially as described.

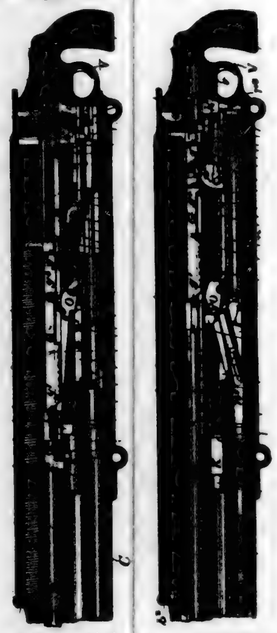
29. In combination with the reciprocatory actuator for the breech mechanism having a pair of vertical apertures therethrough, a pair of cartridge-extracting arms depending through said apertures and having inwardly-extending portions or lugs at their upper ends pivotally connected, and a spring on one of said arms having a bearing on the other adapted to yieldingly force the depending portions thereof toward each other; substantially as described.

30. In a gas-operated machine-gun, the combination with the gas-conduit in communication with the barrel, and the plunger cylinder, of the reciprocatory plunger, and the independently-movable reciprocatory actuator; one of said reciprocatory parts being provided with a hand-pull projecting through a longitudinal slot in the casing, for manual operation; substantially as described.

709,881. AUTOMATIC RAPID-FIRE GUN. VICTOR P. DE KNIGHT, Washington, D. C., assignor, by direct and mesne assignments, to the Victor P. De Knight Gun Company, Washington, D. C., a Corporation of Delaware. Filed Sept. 12, 1902. Serial No. 73,854. (No model.)

Claim.—1. In combination with the receiver having a transverse passage-way for a belt of cartridges, the actuator for the breech mechanism, the gas-impelled piston for moving said actuator in one direction, and a spring for moving the same in the opposite direction, a slide with means for moving the cartridge-belt having a direct connection with a forward extension of the actuator; said extension having a part arranged at an angle to the line of movement of the actuator and engaging the slide, whereby the latter is reciprocated at each reciprocation of the actuator; substantially as described.

2. In combination with the reciprocatory actuator operatively connected with the breech mechanism, a passage-way through the receiver for a belt of cartridges, a reciprocatory slide having a pawl adapted to advance said belt when the slide is impelled in one direction and to recede to position for engaging another cartridge when the slide is moved in the opposite direction, said slide having a slot therein and a portion of said actuator extending through said slot having a part arranged at an angle to the line of movement of the actuator so as to move back and forth therein for directly operating the slide when the actuator is reciprocated; substantially as described



3. In combination with the reciprocatory actuator operatively connected with the breech mechanism, a passage-way through the receiver for a belt of cartridges, a reciprocatory slide having a pawl adapted to advance said belt when the slide is impelled in one direction, and to recede to position for engaging another cartridge when the slide is moved in the opposite direction, said slide having an angular slot therein and an angular portion of said actuator extending through said slot so as to move back and forth therein and having a part arranged at an angle to the line of movement of the actuator for directly operating the slide when the actuator is reciprocated; substantially as described.

4. In a rapid-fire gun, a reciprocatory breech-block, in combination with a relatively stationary cartridge-depressing rocking arm, and means on said block for engaging and depressing said arm when the block moves rearward and for raising it when the block moves forward together with a reciprocatory actuator and means carried thereby for engaging and holding said arm in its raised and depressed positions during reciprocatory movement of the actuator; substantially as described.

5. In a machine-gun, the cartridge depressing and pointing rocking arm having adjacent to its pivot, back of the cartridge-manipulating portion of the arm, a pair of pendent lugs arranged in different vertical planes, one on each side of said pivot, in combination with the reciprocatory breech-block having oppositely-inclined portions or cam-surfaces thereon; one of said lugs being arranged in the path of and adapted to contact with one of said inclines so as to depress said arm when moving in one direction, and the other lug arranged in the path of and adapted to contact with the other incline so as to raise said arm when moving in the opposite direction, substantially as described.

6. In a rapid-fire gun, the cartridge-depressing rocking arm having a pair of pendent lugs near its pivot, back of the cartridge-manipulating portion of the arm; one lug being located in front of and the other in the rear of said pivot, in combination with the reciprocatory breech-block having parallel grooves adapted to receive and guide said lugs and terminating in oppositely-inclined surfaces one of which is adapted to contact with one lug and depress said arm when moving in one direction and the other to contact with the other lug and raise said arm when moving in the opposite direction; substantially as described.

7. In a rapid-fire gun, the cartridge-depressing rocking arm having one depending lug in front of its pivot and another in the rear thereof, in combination with an underlying reciprocatory breech-block having longitudinal grooves or slots in its upper surface forming ways or guides to receive said lugs; said slots terminating at opposite ends in oppositely-inclined portions, one of which is adapted to contact with one of said lugs and depress said arm when the breech-block is moving rearward and the other incline to contact with the other lug and raise said arm when the breech-block is moving forward; substantially as described.

8. In combination with the actuator for the breech mechanism operatively connected with the breech-block for imparting a reciprocatory movement thereto, an intermediate cartridge-depressing rocking arm, and means whereby said arm is depressed by the breech-block on the backward movement thereof and raised when the breech-block is moved forward; said rocking arm having a part adapted to be engaged by the actuator on its rearward movement and positively held up until the cartridge has been carried into position for the action of the breech-block, whereupon said arm will be released by the actuator and depressed by the breech-block, for pointing the cartridge to enter the cartridge-chamber; substantially as described.

9. In combination with the actuator for the breech mechanism operatively connected with the breech-block for imparting a reciprocatory movement thereto, an intermediate cartridge-depressing rocking arm, and means whereby said arm is depressed by the breech-block on the backward movement thereof and raised when the breech-block is moved forward; said rocking arm having a part adapted to be engaged by the actuator on its forward movement and positively held down, and to be also engaged on the rearward movement of the actuator and positively held up until the cartridge has been carried into position for the action of the breech-block, whereupon said arm will be released by the actuator and depressed by the breech-block for pointing the cartridge to enter the cartridge-chamber; substantially as described.

10. In combination with the actuator for the breech mechanism and means whereby it is impelled backwardly by a force resulting from a discharge and forwardly by a spring in which power is stored by the aforesaid force, said actuator being operatively connected with the breech-block for imparting a reciprocatory movement thereto, an intermediate cartridge-depressing rocking arm, and means whereby said arm is depressed by the breech-block on the backward movement thereof and raised when the breech-block is moved forward; said rocking arm having a part adapted to be engaged by the actuator on its rearward movement and positively held up until the cartridge has been carried into position for the action of the breech-block, whereupon said arm will be released by the actuator and depressed by the breech-block for pointing the cartridge to enter the cartridge-chamber; substantially as described.

11. In a rapid-fire machine-gun, the combination with the actuator operatively connected with the breech-block, so as to impart a reciprocatory movement to the latter, of an interposed cartridge-depressing rocking arm having a depending lug thereon in front of its pivot and another lug back of its pivot for engagement with the breech-block, and means whereby the latter will engage said lugs and depress said arm when moved in one direction and raise the same when moving in the opposite direction, together with means carried by the actuator adapted to engage an element on said arm and maintain it in a horizontal or raised position until the cartridge has been carried back to a position to be dropped in front of the cartridge-chamber, whereupon said arm will be released by the actuator and depressed by the breech-block; substantially as described.

12. In combination with the cartridge-depressing rocking arm and means whereby it is depressed by the movement of the breech-block in one direction and raised by the movement thereof in the opposite direction, a projection on said arm having a cross-head and a T-shaped slot in a portion of the actuator adapted to receive the neck and head of said projection when the actuator is moving rearwardly so as to insure a horizontal position of the arm until the cartridge has been carried back to a position to be dropped in front of the cartridge-chamber; substantially as described.

13. In a gas-operated rapid-fire gun, the combination with the receiver for the breech mechanism and the water-jacket having a gas-conduit compounded therewith, of the latter having an elongated slit therein, of a piston working in said conduit, a sliding cover having a connection with said piston through said slit, and a handle or pull-piece for manually operating the piston independently of its adaptability for automatic action; substantially as described.

14. In a rapid-fire machine-gun, the receiver for housing the breech mechanism and an actuator housed in said receiver and operatively connected with said mechanism, in combination with the water-jacket containing the gun-barrel and a gas-conduit compounded with a piston-cylinder having an elongated slit therein, together with a piston working in said cylinder carrying a sliding cover which is connected to the piston through said slit, and a handle or pull-piece connected to said cover to adapt the gun for manual as well as automatic action; substantially as described.

15. In a gas-operated rapid-fire gun, a cradle or receiver for housing the breech mechanism having a water-jacket for housing the gun and connected parts formed integrally therewith; said water-jacket having an integral gas-conduit with a cylinder adapted to receive a reciprocatory piston and a hollow post or coupling-piece connecting with the forward part of the gun-barrel coincident with an aperture in the latter to establish communication with the conduit through said post; substantially as described.

16. In a rapid-fire machine-gun, the receiver consisting of an elongated trough-like body adapted to receive the breech mechanism formed integrally with a water-jacket containing a gas-conduit and adapted to receive a gun-barrel having a port registering with a port communicating with said gas-conduit; substantially as described.

17. In a rapid-fire machine-gun, the receiver consisting of an elongated trough-like body adapted to receive the breech mechanism having a cylindrical water-jacket formed integrally therewith; the latter having a gas-conduit compounded therewith and constructed to receive a gun-barrel having a port registering with a port communicating with said gas-conduit; substantially as described.

18. In a rapid-fire machine-gun, the receiver consisting of an elongated trough-like body, adapted to receive the breech mechanism and having an open top provided with a removable cover and an open rear end provided with a vertically-slidable detachable wedge-block; said trough-like body having a tapered integral tubular extension containing a gas-conduit provided with a port adapted to register with a port in a gun-barrel also contained in said tubular extension; substantially as described.

19. In a gas-operated rapid-fire gun, the combination with a cartridge feeding, loading and firing mechanism and a reciprocatory actuator operatively connected therewith and adapted to be impelled in one direction by a force resulting from a discharge and in the opposite direction by a spring in which power is stored by said force, a gas-conduit having a port communicating with a port in the forward part of the gun-barrel and a piston independent of the actuator fitting a cylindrical portion of said conduit; said piston having a handle or pull-piece for manual operation thereof independently of its adaptability for automatic action; substantially as described.

20. In a rapid-fire gun, the actuator for the breech mechanism consisting of a longitudinally-slidable bar constructed with means for operatively engaging said mechanism and having a forward angular extension having a part arranged at an angle to the line of movement of the actuator for operative engagement with an angular slot in the feed-slide; substantially as described.

21. In combination with the actuator having the angular extension having a part arranged at an angle to the line of movement of the actuator, the feed-slide slotted to receive said extension so as to connect said actuator and slide and adapt them to reciprocate in planes at right angles to each other; substantially as described.

22. In a gas-operated rapid-fire gun, a breech-block having a firing-pin mounted therein, and mechanism for locking the same in firing position and for unlocking them in turn, in combination with an actuator having a limited movement independent of the breech-block, a power-storing cushioning device therefor adapted to first cushion the actuator and then the breech-block as each approaches the limit of its backward movement, and means for utilizing the power thus stored for impelling the firing-pin; substantially as described.

23. In combination with the breech-block and firing-pin carried thereby, and means for locking the same in firing position, the reciprocatory actuator and connections between the same and the breech-block allowing a limited movement only of one independently of the other, means for cushioning the actuator and breech block near the limit of their rearward movement; means for imprisoning the power stored in cushioning said devices to adapt said power to be utilized in impelling the firing-pin when it is released, and means for releasing said cushioning means and firing-pin when the breech-block is locked in firing position, substantially as described.

24. In a machine-gun, the longitudinally-bored breech-block carrying a firing-pin movable freely back and forth within said bore, means for locking the breech-block in firing position, a reciprocatory actuator connected to said breech-block so as to impel the same while allowing a limited movement of the one independently of the other, a cushioning device for said actuator independent of the hammer for the firing-pin and adapted to store power when cushioning the actuator to be utilized in impelling the firing-pin when the latter is released, and means for releasing said cushioning device and firing-pin when the breech-block is locked in firing position.

25. In combination with the breech-block carrying the firing-pin and hammer, a reciprocatory actuator for impelling the breech-block having a limited movement independent thereof, means for cushioning said actuator and breech-block, and means for releasing said cushioning devices, firing-pin and hammer when the breech-block is locked in firing position; said cushioning means being independent of the hammer but adapted to store power which is utilized in impelling said hammer when the latter is released.

26. In combination with the reciprocatory actuator and breech-block and connections between the same allowing a limited movement only of one independently of the other, a cushioning device adapted to first cushion the actuator and then the breech-block as each of said parts approaches the limit of its rearward movement.

27. In combination with the reciprocatory actuator and breech-block connected together in such manner that one may move independently of the other to a limited extent only, and means for successively cushioning said actuator and breech-block as each nears the limit of its rearward movement and storing the power used in cushioning said parts, means for releasing and utilizing the power stored by said cushioning means in impelling the firing-pin, substantially as described.

28. In combination with the reciprocatory breech-block and the actuator therefor, the firing-pin carrying a hammer and slidable longitudinally in a bore through said block, means for cushioning said actuator near the limit of its rearward movement, and means for utilizing the power stored by said cushioning means for impelling the firing-pin when the actuator and breech-block move forward and the firing-pin is released: said cushioning means being independent of the hammer and adapted to act indirectly thereon only when the latter is released by the forward movement of the breech-block.

29. In a machine-gun, the combination with the receiver, and the actuator and breech-block slidably arranged therein, of the breech-block lock comprising a slideway having an abutment and a swinging trailing arm or locking-piece carried by the breech-block adapted to engage said abutment and lock the breech-block when in firing position, said arm having an upwardly and forwardly extending projection, and a cooeting cam device carried by the actuator adapted to positively engage and depress said swinging arm on the forward movement and to engage said projection and lift the said arm on the backward movement of the actuator, substantially as described.

30. In a machine-gun, the combination with the receiver, and the actuator and breech-block slidably arranged therein, of the breech-block lock comprising a slideway having an abutment and a swinging locking-piece carried by the breech-block and having its trailing portion provided with an upward forwardly-curved arm or projection, the free end of said locking-piece being adapted to engage said abutment and lock the breech-block when in firing position, and a cooperating cam member carried by the actuator adapted to engage said curved arm and lift the locking-piece on rearward movement of the actuator, thereby unlocking the breech-block; substantially as described.

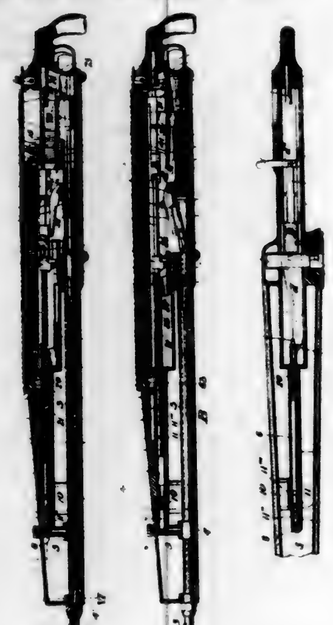
31. In combination with the actuator and breech-block, the breech-block lock consisting of a swinging arm carried by the breech-block having its free end arranged to drop down and engage a step in a guideway therefor when the breech-block is in firing position; said arm having an upturned forwardly curved or inclined finger or cam device, and means carried by the actuator adapted to contact with said cam device and unlock the breech-block on the rearward movement of the actuator, together with a firing-pin and trigger and sear devices arranged to effect the release of the firing-pin by interfering with said swinging arm; substantially as described.

32. In a rapid-fire gun, the reciprocatory actuator and the breech-block impelled thereby, in combination with a cushioning device for said actuator adapted to store power when cushioning the same, means for imprisoning said device when power is stored therein, means for impelling the actuator to and fro, a firing-pin, a hammer independent of said cushioning device, and means for utilizing the power thus stored for impelling said firing-pin when the actuator is advanced; substantially as described.

33. In a rapid-fire machine-gun, the combination with the longitudinally-reciprocatory actuator for operating the breech mechanism, of the transversely-reciprocatory feed-slide for feeding a belt of cartridges transversely through the gun, said actuator having a cam portion thereon engaging a slot in the feed-slide, whereby the latter is reciprocated across the line of movement of the former at each reciprocation of said actuator; substantially as described.

34. In an automatic rapid-fire gun, the combination with the actuator and breech-block impelled thereby carrying a firing-pin, the swinging locking-piece carried by and pivotally connected with the breech-block, and means carried by the actuator for positively actuating said locking-piece to lock the breech, together with trigger and sear devices arranged to effect the release of the firing-pin by interfering with said swinging arm; substantially as described.

709,882. **RAPID-FIRE GUN.** VICTOR P. DE KNIGHT, Washington, D. C., assignor, by direct and mesne assignments, to the Victor P. De Knight Gun Company, Washington, D. C., a Corporation of Delaware. Filed Oct. 18, 1900. Serial No. 33,472. (No model.)



Claim.—1. In a gas-actuated gun, a piston-chamber formed in the casing having a reduced terminal in communication with the bore of the barrel, an exhaust-port leading outwardly from the chamber through the casing back of such reduced terminal and a piston mounted in the chamber provided with a reduced extension and shoulder adapted to interfit with the reduced terminal of the chamber and its shoulder, substantially as set forth.

2. In a gas-actuated gun, a piston-chamber formed in the casing comprising the water-jacket, an exhaust-port leading outwardly and downwardly therefrom through the casing, a reduced extension of the piston-chamber beyond such exhaust-port in communication with the bore of the barrel, an intervening pressure-regulating device, and a piston mounted in the chamber provided with a reduced extension loosely fitting into the extension of the chamber, and provided with a shoulder adapted to abut against the shoulder formed by such reduced extensions, and to receive the gas-pressure, substantially as set forth.

3. In a gas-actuated gun, a piston-chamber formed in the casing comprising the water-jacket, an exhaust-port leading outwardly and downwardly therefrom through the casing, a reduced extension of the piston-chamber, beyond such exhaust-port in communication with the bore of the barrel, an intervening pressure-regulating device, and a piston mounted in the chamber provided with a reduced extension loosely fitting into the extension of the chamber provided with a shoulder of the full diameter of the piston-chamber adapted to abut against the shoulder formed by such reduced extension, and having a reduced neck back of each shoulder to permit clearance, substantially as set forth.

4. In a gas-actuated gun, a piston-chamber, the forward portion of which communicates with the barrel and the rear portion of which is of larger diameter than the forward portion and communicates with an exhaust-opening, and a piston mounted in said rear portion, and provided with a reduced extension, projecting into said forward portion.

5. In a gas-actuated gun, a piston chamber, the forward portion of which communicates with the barrel and the rear portion of which is of larger diameter than the forward portion and communicates with an exhaust-opening, and a piston consisting of a collar portion and a plunger portion, the collar portion fitting against the rear of the front portion and the plunger extending thereinto.

6. In a gas-actuated gun, a piston-chamber, the forward portion of which communicates with the barrel with an intervening pressure-regulating device, and the rear portion of which is of larger diameter than the forward portion and communicates with an exhaust-opening, and a piston, consisting of a collar portion fitting against the rear of the front portion and a plunger extending therefrom.

7. In a gas-actuated gun, the combination with a piston-chamber formed in the casing and communicating with the bore of the barrel, of an enlargement of the chamber communicating with an exhaust-opening, and a piston mounted in the chamber through the enlargement, provided with a reduced extension freely fitting in the forward terminal of the chamber and having a shoulder adapted to abut against the shoulder formed by the reduced terminal of the chamber, beyond the enlargement, substantially as set forth.

8. In a gas-actuated gun, the combination with the piston, of a reciprocating actuator, a spring-controlled pin, said pin being beveled on its lower end, the actuator being provided with a beveled tip adapted to engage the beveled face of the pin and lift the pin to automatically effect connection of the actuator and piston.

9. In a gas-actuated gun, the combination with a piston mounted in a chamber having a port communicating with the bore of the barrel, of a reciprocating actuator, and a device for automatically connecting the piston and actuator, and for automatically disconnecting such parts by drawing the actuator backward and bringing the connecting device into contact with a stationary abutment, substantially as set forth.

10. In a gas-actuated gun, the combination with a piston mounted in a chamber having a port communication with the bore of the barrel, of a reciprocating actuator having a reduced extension fitting into the end of the piston and a pin passing through the extension of the actuator extending downwardly from a tapered spring-bar laid in the top of the piston, and adapted to withdraw the pin to detach the actuator, by lifting action of an interfering abutment, substantially as set forth.

11. In a gas-actuated gun, the combination with a piston mounted in a chamber having a port communicating with the bore of the barrel, of a reciprocating actuator having a reduced extension fitting into the end of the piston and a spring secured to the piston, provided with a beveled pin projecting through the piston and actuator extension, and having an extended under sloping lifting tip, substantially as set forth.

12. In a gas-actuated gun adapted to use belt-carried cartridges, the combination of a piston-chamber communicating with the bore of the barrel, a piston mounted in the chamber and provided with a push-bolt extension, and a rearwardly-removable actuator detachably connected with the piston.

13. In a gas-actuated gun provided with means for feeding a cartridge-belt transversely through the gun, the combination of a piston-chamber communicating with the bore of the barrel, a piston mounted in the chamber provided with a push-bolt extension adapted to push the cartridge from the belt, and rearwardly-removable means for feeding the cartridge-belt detachably connected with the piston.

14. In a machine-gun having a piston-chamber formed in the casing communicating with the bore of the barrel, and a piston mounted in the chamber, the combination with a cartridge-filled belt and a rearwardly-removable actuator detachably connected with the piston, actuated by the discharge of the gun for feeding the belt through the gun, of a push-bolt extending below and beyond the piston, operating in conformity with the belt and adapted to discharge the cartridge therefrom by impact against the tip of the bolt.

15. In a gas-actuated gun, the combination with a cartridge-filled belt and a reciprocating feed-block provided with means for engaging the belt, of a cam-bar adapted to reciprocate the feed-block and a piston connected with the cam-bar and mounted in a piston-chamber communicating with the bore of the barrel.

16. In a gas-actuated gun, the combination with a cartridge-filled belt, means for limiting the movement of the belt and a reciprocating feed-block provided with means for engaging the belt, of a cam-bar adapted to reciprocate the feed-block, and a piston detachably connected with the cam-bar and mounted in a piston chamber communicating with the bore of the barrel.

17. In a gas-actuated gun, the combination of a piston mounted in a chamber having a port communicating with the bore of the barrel, a push-bolt extension of the piston adapted to push the cartridge from the belt, a rearwardly-removable reciprocating actuator detachably connected to the piston, and means connected with the actuator for manipulating and firing the ammunition, substantially as set forth.

18. In a rapid-fire gun, the combination with the cartridge-depressing arm, of the actuator-bar provided with means for supporting the depressing arm erect and means for positively forcing the depressing-arm downwardly from such support when released therefrom, substantially as set forth.

19. In a rapid-fire gun, the combination with the cartridge-depressing arm provided with a supporting-button, of the actuator-bar provided with slotted ways for engaging and supporting the depressing-arm in one direction and a pressure-spring adapted to close the opening to the ways against the resistance of the supporting-button, substantially as set forth.

20. In a rapid-fire gun, the combination with means for discharging a cartridge from a belt, of vertical guiding-faces corresponding to the sides of the cartridge adapted to facilitate its vertical fall, supporting-lugs for the rim of the cartridge, a pivoted depressor adapted to point the cartridge, and a reciprocating breech-block adapted to manipulate the depressor and to insert the cartridge in the breech of the barrel, substantially as set forth.

21. In a rapid-fire gun, the combination of a piston mounted in a piston-chamber in communication with the barrel, an actuator connected with the piston, a reciprocating breech-block in engagement with the actuator and provided with a locking device operated by the actuator, a central firing-pin mounted in the breech-block, a sear and trigger, and means incorporated with the actuator for disengaging the sear to release the firing-pin, substantially as set forth.

22. In a rapid-fire gun, the combination of a piston mounted in a piston-chamber, in communication with the barrel, an actuator detachably connected with the piston, a reciprocating breech-block in engagement with the actuator and provided with a locking device operated by the actuator, a central firing-pin mounted in the breech-block, a sear and trigger, and means incorporated with the actuator for disengaging the sear to release the firing-pin, substantially as set forth.

23. In a rapid-fire gun, the combination of a piston mounted in a piston-chamber in communication with the barrel, an actuator detachably connected with the piston, a reciprocating breech-block in engagement with the actuator and provided with a locking device operated by the actuator, a central firing-pin mounted in the breech-block having a lateral lug, a pivoted sear adapted to engage the lug, and means incorporated with the actuator for disengaging the sear to release the firing-pin, substantially as set forth.

24. In a rapid-fire gun, the combination of a piston mounted in a piston-chamber in communication with the barrel, an actuator detachably connected with the piston, a reciprocating breech-block in engagement with the actuator and provided with a locking device, operated by the actuator, a central firing-pin mounted in the breech-block having a lateral lug, a pivoted sear adapted to engage the lug, a trigger-rod having an enlarged end resting on the opposite end of the sear, and a pin connected with the actuator adapted to engage the enlargement of the trigger-rod to depress the sear and release the firing-pin, substantially as set forth.

25. In a rapid-fire gun the combination with a reciprocating actuator connected with a piston mounted in a chamber having a port communicating with the bore of the barrel, and a spring-actuated buffer block having an impelling-bracket, adapted to be engaged by the firing-pin and retracted, and to exert a forward impulse thereto; of a firing-pin provided with an enlarged hollow head for the purpose set forth, and having lateral bearings with intervening air-passages, substantially as set forth.

26. In a rapid-fire gun, the combination of a pivotally-mounted spring-actuated locking-sear in engagement with a firing-pin, provided with an extension extending beyond the pivotal bearing, a trigger-rod extending over the extension and provided with a beveled enlargement, and a reciprocating shoe secured to the actuator provided with a lateral pin adapted to ride over the enlargement of the trigger-rod and to depress it and the sear extension, to release the firing-pin, substantially as set forth.

27. In a rapid-fire gun, in combination with a reciprocating breech-block and a locking-sear for the firing-pin, a lock pivotally secured to the breech-block and bearing against it, a reciprocating shoe traveling with the actuator adapted to raise and support the lock and to depress it into locking position, and provided with a lateral pin adapted to depress the end of the sear to release the firing-pin, substantially as set forth.

28. In a rapid-fire gun, provided with a reciprocating actuator; a slot in the side of the locking-cam projecting downwardly and outwardly to prevent entrance of the elements, and similarly-shaped pull-bar extending from the actuator outwardly through the slot, substantially as set forth.

29. In a gun provided with a tension-storage spring and having a hinged lid for the case; a securing-eye on the lid for one end of the spring, projecting below the hinge whereby when the lid is raised the eye is thrown rearwardly to release the tension on the spring, substantially as set forth.

30. In a gas-actuated gun, the combination of an integral receiver and water-jacket; a piston-chamber in the water-jacket communicating with the barrel; a piston therein provided with a push-bolt, a reciprocating actuator connected with the piston and adapted to be retracted thereby, a tension-spring, a slide-block transversely arranged across the throat of the gun operated by the actuator; a sear, a buffer-block and spring, and means for releasing the sear, substantially as set forth.

31. In a rapid-fire gun, the combination of a reciprocating actuator provided with a downwardly-projecting beveled shoe extension having a lateral pin, a reciprocating breech-block in engagement with the actuator, a lock pivotally secured to the breech-block provided with shoulders adapted to bear against it in a raised or lowered position, and having a horn adapted to be engaged by the shoe extension, a firing-pin mounted in the breech-block provided with a locking-lug, a pivoted rear adapted to engage the locking-lug, and a trigger-rod having an enlarged end resting on the rear extremity, adapted to be depressed by the pin on the shoe extension, substantially as set forth.

32. In a rapid-fire gun, the combination of a reciprocating actuator, a spring-actuated buffer-bar adapted to be retracted thereby and provided with an impelling-bracket, a breech-block operating in conformity with the reciprocating actuator provided with a central opening for the firing-pin and air-outlet opening through the breech-block; of a firing pin centrally mounted in the breech-block, adapted to be retracted thereby for the full travel of the breech-block, and provided with a head adapted to be engaged by the impelling-bracket, substantially as set forth.

33. In a rapid-fire gun, the combination of a reciprocating actuator, a spring-actuated buffer-bar adapted to be retracted thereby and provided with an impelling-bracket, a breech-block operating in conformity with the reciprocating actuator provided with a central opening for the firing-pin and air-outlet openings through the breech-block; of a firing-pin centrally mounted in the breech-block, adapted to be retracted thereby for the full travel of the breech-block, and provided with a head adapted to be engaged by the impelling-bracket, each head providing lateral bearings for the pin and having air-passages therein, substantially as set forth.

34. In a rapid-fire gun, the combination of a reciprocating actuator, a spring-actuated buffer-bar adapted to be retracted thereby and provided with an impelling-bracket, a breech-block operating in conformity with the reciprocating actuator provided with a central opening for the firing-pin, and air-outlet openings through the breech-block; of a firing-pin centrally mounted in the breech-block, adapted to be retracted thereby for the full travel of the breech-block and provided with a head to hold it in a retracted position and for releasing it to fire, substantially as set forth.

709,883. AUTOMATIC RAPID-FIRE GUN. VICTOR P. DE KNIGHT, Washington, D. C., assignor, by direct and mesne assignments, to The Victor P. De Knight Gun Company, Washington, D. C., a Corporation of Delaware. Filed July 12, 1901. Serial No. 68,066. (No model.)

Claim.—1. In a machine-gun, a reciprocatory actuator and means for imparting a reciprocating movement thereto; said actuator carrying an integral parts thereof a part adapted to encounter the flange of a cartridge in the cartridge feed-belt and withdraw the cartridge therefrom when moving backward, a second part adapted to engage the breech-block lock and release the breech-block on the same movement, and a third part to engage an element on the breech-block and move the latter rearward the instant it is unlocked; said unlocking part adapted to engage another portion of the locking device and move the breech-block forward on the forward movement of the actuator, and said second engaging part adapted to engage the firing-pin and discharge the gun the instant the breech-block is locked in firing position, substantially as described.

2. In a machine-gun, the combination with a receiver, of a reciprocatory actuator and breech-block, the former having a limited movement independent of the latter and adapted to move the same in the direction of its own movement at the limit of its independent movement in either direction, and a locking device, comprising a stop or abutment within the receiver and a locking-dog on the breech-block adapted to be engaged by said abutment to lock the breech-block in firing position, said dog being pivotally secured between its ends to the breech-block and having a projection at each end lying in the path of movement of a part carried by the actuator for engagement therewith, together with said engaging element arranged between said projections so as to engage one projection when moving forward and thereby lock the breech-block in firing position, and to engage the other projection when moving backward and thereby release the breech-block on the return movement of the actuator.

3. In a machine-gun, the combination with a reciprocatory breech-block, an actuator arranged to reciprocate the same, of a bell-crank-shaped locking-dog pivoted to the breech-block, an abutment with which said dog engages to lock the breech-block when the latter is in closing position, and a projection on the actuator arranged between the members of said locking-dog and adapted to engage said members alternately, on forward and rearward movement of the actuator, thereby tilting the dog to lock and unlock the breech block; substantially as described.

4. The actuator comprising a reciprocatory bar having a cylindrical extension at its forward end, and a terminal piston or plunger integral therewith adapted to fit a suitable piston-cylinder, means carried by the actuator for impelling the breech-block and locking the latter in firing position on its forward movement, and for unlocking the breech-block and impelling it rearwardly on the rearward movement of the actuator, together with means carried by the actuator adapted to withdraw a cartridge from the feed-belt when the actuator moves rearward and to impel the firing-pin when the actuator moves forward.

5. In combination with the receiver containing the breech mechanism, including a breech-block, a cartridge-depressing device and a reciprocatory actuator for imparting movement thereto, a passage-way within the receiver for conducting a cartridge extracted from the feed device into position to be inserted in the breech of the gun-barrel, one wall of said passage having a spring fitted thereon or thereto for maintaining the cartridge in proper position until it reaches the limit of its rearward movement.

6. In a machine-gun, a passage-way for a belt of cartridges, and a reciprocatory feed-slide for advancing said belt, and a feed-dog carried by said slide having a limited independent movement in the direction of the travel of the slide, a stud on the dog adapted to contact with the slide on forward travel so as to retain the dog in engagement with the cartridge, and a recess in said slide in which said stud recedes on backward travel to release the dog and permit it to slip back freely past the next cartridge; substantially as described.

7. In a machine-gun, a passage-way for a belt of cartridges, and a feed-slide for advancing said belt step by step, a pivoted feed-dog carried by said slide having a slidable pivot permitting a limited movement of the dog in the direction of travel of the slide, a stud on said dog adapted to contact with the slide on forward travel, and a recess in said slide in which said stud recedes on backward travel; substantially as and for the purpose described.

8. In a gas-operated machine-gun, the combination of a receiver, a water-jacket having an internal gas-conduit, and a barrel fitted in the front of the receiver and extending through coaxial openings in the gas-conduit and front of the jacket, said barrel having a lateral gas-exit port registering with the bore of the gas-conduit, annular grooves on the barrel in the openings in said gas-conduit and jacket, and packing-rings fitted in said grooves forming water-tight joints while permitting expansion and contraction of the barrel; substantially as described.

9. In a gas-operated machine-gun, the reciprocatory actuator and means integral therewith for actuating the breech-block and feed-slide and for extracting a cartridge from a belt of cartridges when the actuator moves rearward, said actuator having a forward integral cylindrical extension and a reduced terminal portion forming a piston proper to fit a piston-cylinder communicating with a gas-conduit; substantially as described.

10. In a gas-operated machine-gun, the reciprocatory actuator having integral contacting portions thereon adapted to extract a cartridge from the cartridge-belt on its rearward movement, and impart movement to the breech-block on both its backward and forward movements; said actuator having a limited movement independently of the breech-block, and provided with a forward integral extension forming a piston or plunger adapted to fit a piston-cylinder communicating with a gas-conduit leading from a port in the gun-barrel; substantially as described.

11. In a gas-operated machine-gun, the receiver having a water-jacket secured thereto and an internal gas-conduit and piston-cylinder compounded integral with said water-jacket, said conduit communicating with a port in the gun-barrel, in combination with the reciprocatory actuator having a forward integral extension forming a piston or plunger working in said piston-cylinder; substantially as described.

12. The water-jacket formed with a recess to provide an outlet therefrom into the open air, the said recess dividing the conduit and piston-cylinder proper from the rearward extension of the cylinder which receives and guides a cylindrical extension of the actuator carrying said piston; substantially as described.

13. In an automatic rapid-fire gun, the combination with the receiver, barrel and gas-conduit communicating with the latter, of a reciprocatory actuator arranged above the barrel and having a plunger portion contained in the conduit, said actuator being rearwardly impelled by the gases of discharge and forwardly impelled by a spring, cartridge-feeding mechanism operated by the actuator and arranged above the breech of the barrel, means carried by the actuator for raising a cartridge on rearward travel, means for inserting the cartridge in the breech of the barrel, a reciprocatory breech-block carrying a firing-pin and a trailing locking-dog, said actuator having a limited movement independent of the breech-block but impelling the same at the limit of its independent movement in either direction, a pendent lug on the actuator engaging said locking-dog to lock the breech-block in closing position but to release the same after firing, and a pendent lug on the actuator adapted to impel the firing-pin when the breech-block stands locked; substantially as described.

709,884. CAR-BRAKE. JOHN H. DE MAY and FREDERICK HEYLAND, Jr., Jackson, Mich. Filed Jan. 20, 1902. Serial No. 91,000. (No model.)

Claim.—1. In brake-setting mechanism, a drum adapted to be connected with the brake to be applied, a pinion connected for rotation with the drum, a worm, a brake-setting shaft for actuating the said worm, and a differential-speed gear having its toothed portions in mesh with, respectively, the said worm and pinion, substantially as set forth.

2. In brake-setting mechanism, a frame of approximately U form, parallel shafts journaled in the longitudinal or side portions of the frame, a drum secured to the innermost shaft, a differential-speed gear keyed to the other shaft and having the toothed portion of greater diameter in mesh with the teeth of a pinion connected for rotation with the said drum, and a worm-gear in mesh with the other toothed portion of the differential-speed gear and journaled at a right angle to the aforementioned shaft, substantially as set forth.

3. In brake-setting mechanism, a frame, parallel shafts, spaced drums secured to one of the shafts, a pinion intermediate of the drums and connected for rotation therewith, a differential-speed gear mounted upon the other shaft and in mesh with the said pinion, and a drive worm-gear in mesh with a toothed portion of the differential-speed gear, substantially as set forth.

709,885. STENCIL-PRINTING MACHINE. ALBERT B. DICK, Chicago, Ill. Filed July 19, 1901. Serial No. 68,268. (No model.)

Claim.—1. In a stencil-printing machine of the type described, the combination with a stencil-carrier and a paper-carrying frame geared together, of a shaft connected to the stencil-carrier, a pinion on the shaft, an oscillating segment engaging with said pinion, a hand-operated balance-wheel, and connections between said balance-wheel and said segment for oscillating the latter, a ratchet and pawl being interposed in said connections, substantially as set forth.

2. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier loosely mounted on said shaft, and a worm-gear for adjusting the stencil-carrier with respect to the shaft, substantially as set forth.

3. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier loosely mounted on said shaft, a worm-gear for adjusting the stencil-carrier with respect to the shaft, and means for disengaging the elements of said worm-gear, substantially as set forth.

4. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier mounted on said shaft and adjustable longitudinally with respect to the same, a plurality of grooves in said shaft, and a latch on the stencil-carrier for engaging said grooves, substantially as set forth.

5. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier adjustable circumferentially with respect to the shaft, and a braking-spring connected to the shaft and engaging the stencil-carrier, substantially as set forth.

6. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier adjustable longitudinally and circumferentially with respect to said shaft, a latch for locking the stencil-carrier against longitudinal movement, and a braking-spring connected to the shaft for resisting radial movement of the stencil-carrier, substantially as set forth.

7. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier adjustable longitudinally and circumferentially of the shaft, a latch for locking the stencil-carrier against longitudinal movement, a worm-gear on the stencil-carrier, and a worm connected to the shaft engaging said worm-gear, substantially as set forth.

8. In a stencil-printing machine, the combination with a shaft and means for operating the same, of a stencil-carrier adjustable longitudinally and circumferentially of the shaft, a latch for locking the stencil-carrier against longitudinal movement, a worm-gear on the stencil-carrier, a worm connected to the shaft engaging said worm-gear, and a braking-spring connected to the shaft, engaging the stencil-carrier and moving the same longitudinally to disengage the worm from the worm-gear when said latch is operated, substantially as set forth.

9. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame geared to said stencil-carrier, of an impression-roller coöperating with the stencil-carrier, a lever connected with said impression-roller, a cam for operating said lever, and levers coöperating with stops on the paper-carrying frame for partially turning said cam in reverse directions, substantially as set forth.

10. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carry-

ing frame geared to said stencil-carrier, of an impression-roller coöperating with the stencil-carrier, a lever connected with said impression-roller, a cam for operating said lever, levers coöperating with stops on the paper-carrying frame for partially turning said cam in reverse directions, and an equalizing-lever coöperating with said cam, substantially as set forth.

11. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame geared to said stencil-carrier, of an impression-roller coöperating with said stencil-carrier, a cam for elevating and depressing the said impression-roller, a lever connected directly with the shaft of said cam for partially turning the cams in one direction, and another lever connected to the cam for turning the cam in the opposite direction, substantially as set forth.

12. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame geared to said stencil-carrier, of an impression-roller coöperating with said stencil-carrier, a cam for elevating and depressing the said impression-roller, a lever connected directly with the shaft of said cam for partially turning the cams in one direction, another lever connected to the cam for turning the cam in the opposite direction, and an equalizing-lever coöperating with said cams, substantially as set forth.

13. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame geared to said stencil-carrier, of an impression-roller, two bell-cranks carrying the impression-roller, a cam-shaft, cams on said shaft with which the bell-cranks engage, and levers coöperating with stops on the paper-carrying frame for partially rotating the cams, as and for the purposes set forth.

14. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame geared to said stencil-carrier, of an impression-roller, two bell-cranks carrying the impression-roller, a cam-shaft, cams on said shaft with which the bell-cranks engage, levers coöperating with stops on the paper-carrying frame for partially rotating the cams, and equalizing-levers coöperating with said cams, as and for the purposes set forth.

15. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame geared to said stencil-carrier, of an impression-roller, two bell-cranks carrying the impression-roller, a cam-shaft, cams on said shaft with which the bell-cranks engage, levers coöperating with stops on the paper-carrying frame for partially rotating the cams, equalizing-levers coöperating with said cams, a pair of springs at each side of the machine connected to the equalizing-levers and bell-cranks, and a common adjusting mechanism for each pair, substantially as set forth.

16. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame connected to said stencil-carrier, of an impression-roller coöperating with the stencil-carrier, a cam-shaft for depressing and elevating said impression-roller, an arm carried by said shaft, a counter connected to said arm, and a latch for holding said arm in a normally elevated position to keep the impression-roller normally depressed, substantially as set forth.

17. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame, of a stationary jaw mounted on said frame, a shaft mounted in the frame beneath the jaw, a gripper on said shaft, a pinion on said shaft, and a rack engaging said pinion to rotate the shaft to withdraw the gripper, substantially as set forth.

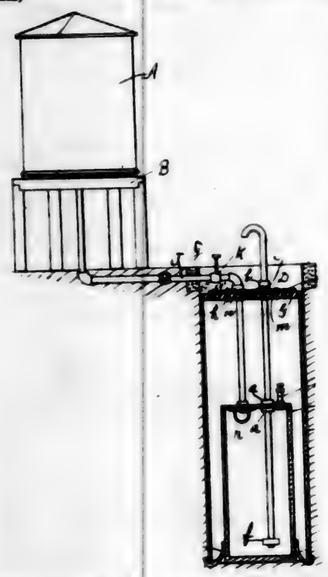
18. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame, of a stationary jaw mounted on said frame, a shaft mounted in the frame beneath the jaw, a gripper on said shaft, a pinion on said shaft, a rack engaging said pinion to rotate the shaft to withdraw the gripper, a rod for operating said rack, and a buffer on said rod engaging a stationary stop on the main frame, substantially as set forth.

19. In a stencil-printing machine of the type described, the combination with an oscillating stencil-carrier and a reciprocating paper-carrying frame, of a stationary jaw mounted on said frame, a shaft mounted in the frame beneath the jaw, a gripper on said shaft, a pinion on said shaft, a rack engaging said pinion to rotate the shaft to withdraw the gripper, a rod connected to said rack, a block on said rod, and a spring-latch for normally locking said block to hold the gripper in a retracted position, substantially as set forth.

709,886. BOBBIN HOLDER-CASE FOR SEWING-MACHINES. ALBERT DÖRING, Dresden, Germany, assignor to Aktiengesellschaft, vormals Seidel & Naumann, Dresden, Saxony, Germany. Filed June 12, 1902. Serial No. 111,304. (No model.)

Claim.—A sewing-machine bobbin-case carrier, comprising a double-armed pivotal catch one arm of which constitutes a bolt for the movable half of the case, a cam device actuated by the said catch, and a hinged fork operated by said device, for preventing the bobbin sliding down on opening the case, substantially as described.

709,887. APPARATUS FOR COOLING WATER. WILLIAM J. BERRY, Rhome, Tex. Filed May 20, 1901. Serial No. 61,668. (No model.)



Claim.—A water-cooling apparatus comprising a subterranean cistern, a pipe connected with a water-supply source and projecting in said cistern, a discharge-pipe projecting in said cistern, a cavity for said cistern, a facing-wall for said cavity, a cover for said cavity, and means for locking said facing-wall and said cover and said cistern together consisting of nuts for attaching said pipes rigidly to said cistern, hooks attached to said cistern and engaging the bottom edge of said facing-wall, and nuts on said pipes for pressing said cover on said facing-wall.

709,888. PUZZLE. WILLIAM H. BERRY, Auburn, Me., assignor to Payson T. Sykes, Auburn, Me. Filed Jan. 20, 1902. Serial No. 91,344. (No model.)

Claim.—1. In a puzzle, a body portion having a cylindrical opening and an annular groove in the wall of said opening in combination with a plunger fitting within the opening, said plunger having an annular recess opposite to and wider than the groove in the cylinder and having an inclined pocket extending from said recess into the plunger, and a ball of greater diameter than the depth of said groove or recess adapted to fit into said pocket.

2. In a puzzle, a body portion having a cylindrical opening and an annular groove in the wall of said opening in combination with a plunger fitting within the opening, said plunger having an annular recess opposite to and wider than the groove in the cylinder and having a pocket extending from said recess into the plunger, a ball of greater diameter than the depth of said groove or recess adapted to fit into said pocket, and a stop for said plunger arranged to hold the latter with the pocket opposite the groove when the plunger is in its inmost position.

3. In a puzzle, a body portion having a cylindrical opening and an annular groove in the wall of said opening, in combination with a plunger fitting within the opening, said plunger having two heads and an annular recess between said heads, and having a pocket extending into the plunger at the base of one of said heads, and a ball of greater diameter than the depth of said groove or recess adapted to fit into said pocket.

709,889. FILE. HENRY F. HOLLANDER, Chicago, Ill. Filed Apr. 21, 1902. Serial No. 104,011. (No model.)

Claim.—1. A file for the temporary or permanent preservation of papers, journals, charts, plats, maps, plans, drawings, blue-prints and other documents, comprising a main staff preferably of wood, and cylindrical in form and of one piece, said staff being constructed with several longitudinal channels of triangular form and closed at one end of said staff, the openings at the other end of said staff being enlarged and rounded out, and also having a transverse groove across the end of said staff and between the open ends of said channels; a plate corresponding in form to the end of said staff and affixed thereto and having openings corresponding to the shape of the open ends of the channels in said staff and covering said transverse groove; a spring adapted to be retained and to be operated in said transverse groove the free end of said spring extending therefrom and beyond the diameter of said staff, the fixed end extending through a hole in the center of said plate and formed into an eye; a number of loose rods or files corresponding to the number of channels in the staff and adapted to be freely inserted and removed therefrom, and a cap adapted to fit over the end of the staff and to cover the open ends of the channels and to be held in position on said staff by the fixed end of said spring and having an opening in its periphery corresponding in form with the open ends of the channels in the staff, said cap being arranged to be rotated on said staff and the opening in said cap brought into line with the openings of the channels in the staff and to close all of said channels and to be locked in the closed position by the free end of the spring, substantially as described and for the purposes specified.

2. The combination in a file of the class described of a main staff having a series of longitudinal channels, the interior sectional area of each of said channels increasing in size from the exterior opening and toward the axis of said staff, so as to provide ample space for the insertion therein and removal therefrom of a loose rod or file and for the folds of paper or fabric surrounding said rod or file when adjusted and held in said channel, and a series of rods or files corresponding in number with the said channels, with means for closing the ends of said channels and thereby retaining said rods therein, substantially as described.

3. The combination of a file of the class described of a main staff having a transverse groove in its end, and several longitudinal channels triangular in form; rods or files corresponding in number to said channels and adapted to be inserted and removed therefrom and a movable cap adapted to be attached to one end of said staff and having an opening corresponding to the open ends of said channels, with a spring adapted to be retained and operated in the transverse groove in the end of said staff and by a plate affixed to said staff and covering said groove and to hold said cap and lock it in position to close said channels, substantially as described and for the purposes specified.

4. The combination in a file of the class described of a main staff having several longitudinal triangular channels and a transverse groove in one end of said staff and rods or files adapted to be inserted in and removed from said channels and to hold papers and documents therein, with a plate adapted to be attached to the end of said staff and to cover said transverse groove therein and to hold the fixed end of the spring retained and supported in said groove, and a spring held by said cap and retained in said groove adapted to lock the adjustable cap on said staff, substantially as described and for the purposes specified.

709,890. LOG-CARRIAGE OFFSET FOR SAWS. SAMUEL BEE Chesmisses, Canada, assignor of one-half to the William Hamilton Manufacturing Co., L't'd., Peterborough, Ontario, Canada. Filed Jan. 13, 1902. Serial No. 89,562. (No model.)

Claim.—1. In an offset mechanism for the carriage of a saw; toggle-levers horizontally disposed adjacent to one or more of the axles of the carriage-wheels, one end of each toggle being pivoted on a ring in which the axle is rotatable, while incapable of end movement through it, the other end of the toggle being pivotally connected to the underframe of the carriage; and an endless rope passing around grooved wheels, one of which is connected to a brake-pulley; and means connecting said toggle with said rope whereby the toggle mechanism may be actuated from and to the straight, so as to draw the carriage laterally on its axle-bearings from the cutting plane of the saw, and restore it as desired.

2. In a saw-log carriage, the wheels of which have a lateral hold on the rails on which they run, and having a toggle mechanism adapted to move the underframe of the carriage laterally on the axles of its wheels as desired; stops in the center joint of the toggle in the extended or straight position, so that the underframe of the carriage shall be rigidly held to the cutting plane of the saw, a lever controlling said toggle and having its free end adapted to frictionally engage an endless rope; flanged wheels for carrying said rope, one of said wheels, through its shaft, being in rigid connection with a pulley having a brake-strap, whereby the movement of the rope in either direction is sufficiently resisted to operate the toggle, and shift the carriage to the desired lateral position in both its forward and its return movements, as specified and for the purpose set forth.

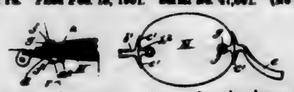
3. In the log-carriage of a saw as described, having an offset mechanism to move the carriage-underframe laterally on its axles; an endless line passing over sheaves beyond the extreme limit of each end of the carriage travel, each line being attached to the offsetting mechanism on the carriage; means for keeping the line tight; and a designed frictional resistance to the movement of the line with the carriage, so that as the carriage moves in one direction, an opposite pull may be exerted on the line to operate the offset mechanism.

4. In a mechanism for offsetting the log-carriage of a saw by means of a toggle connected at one end to one or more of the axles of the carriage, and at the other to its underframe; a lever fulcrumed to the carriage-underframe adjacent to the toggle, and having its opposite end attached to the operating-line; a link or links connecting the joint-pin of the toggle to the aforesaid lever, whereby the pull of the operating-line may be commenced to the toggle with an increased effort.

5. In a device for offsetting a saw-log carriage, the wheels of which have a lateral hold on the rails; the grooved roller 2 secured to one or more of the carriage-axles; the ring 3 having studs 3^a adapted to fit the groove of 2, so that 2 shall be rotatable in it; the stop-toggle composed of members 4 and 4^a, one extreme of which is adapted to receive the studs 3^a while the other is pivotally attached to the carriage-underframe; the lever 11 fulcrumed to the underframe adjacent to the toggle; the links 12 connecting each lever to the toggle; the endless line 13 passing around the sheaves 14, one of which is mounted in a tightening-frame, each line being attached to the free end of each lever 11; and the brake-pulley 16 keyed to the axle of one of the sheaves 14, and having a friction-strap or brake-block whereby a resistance is offered to the movement of the line 13 with the log-carriage sufficient to operate the mechanism and offset the carriage-frame on the axles of its wheels.

6. The combination with the wheeled axles, movable in reverse directions on suitable supporting-rails, an endless cable connected to the axles for imparting reverse movement thereto, and the supporting frame C loosely mounted on the axles, and a friction-brake for retarding the action of the cable at the beginning of its reverse movements; of a toggle mechanism, comprising the members 4 4^a having a stop-hinge connection, the member 4^a being connected to one frame member C, the other toggle member 4 having a pivotal and slidable connection with one of the wheeled axles, the lever 11, having a fixed pivotal connection at one end, its other end being joined with the driving-cable, and a link joining said lever 11 and the pivotal connection of the two toggle members 4 and 4^a, all being arranged substantially as shown and for the purposes described.

709,891. SPECTACLES OR EYEGLASSES. WALTER S. BIRDS, Reading, Pa. Filed Feb. 13, 1901. Serial No. 47,001. (No model.)



Claim.—1. In spectacles or eyeglasses a frameless lens and a fitting therein having one clamping-ear only to contact with one face of the lens, registering perforations in said lens and clamping-ear, and a clamping bolt or rivet passing therethrough and having its axis radial to the curvature on the opposite face of the lens.

2. In spectacles or eyeglasses a frameless lens and a fitting therein having one clamping-ear only to contact with one face of the lens, registering perforations in said lens and clamping-ear, and a clamping bolt or

rivet passing therethrough and having its axis radial to the curvature on the opposite face of the lens said clamping bolt or rivet having a head adjustably seated in said clamping-ear and a washer or nut thereon squarely seated against the opposite face of the lens.

2. An integrally-formed sheet-metal fitting for frameless spectacle-lenses, comprising a lens-attaching ear, a plate extension thereof beyond the edge of the lens lying in the plane of said ear, and opposite wings on said extension-plate having their outer ends turned approximately at right angles to said plane to contact flatwise with the periphery of the lens and form separated stops against the latter substantially as set forth.

4. An integrally-formed sheet-metal fitting for frameless spectacle-lenses, comprising a lens-attaching ear, a plate extension thereof beyond the edge of the lens lying in the plane of said ear, and opposite wings on said extension-plate having their outer ends turned approximately at right angles to said plane to contact flatwise with the periphery of the lens and form separated stops against the latter, the inner portions of said wings extending within the periphery of the lens and serving to rigidly brace said stops substantially as set forth.

5. A sheet-metal blank for a spectacle or eyeglass lens-fitting, comprising a lens-attaching ear, a stem extension therefrom terminating in temple joint-ears, and intermediate wings on opposite sides of said stem extension adapted to form stops against the edge of the lens, all lying normally in the same plane, substantially as set forth.

6. A sheet-metal blank for a spectacle or eyeglass lens, comprising a lens-attaching ear, a stem extension therefrom, and opposite wings on said stem extension, all lying normally in the same plane, the ends of said wings being extended lengthwise of the stem beyond their connection to the latter substantially as and for the purpose set forth.

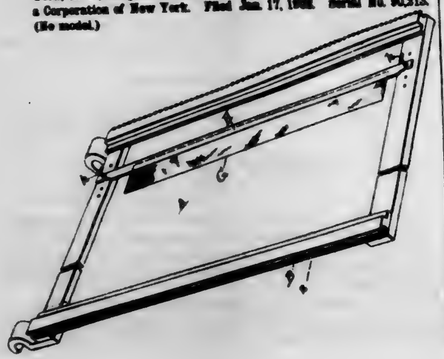
709,892. EYEGLASSES. WILLIAM W. REECE, Reading, Pa. Filed Sept. 11, 1901. Serial No. 75,020. (No model.)

Claim.—1. The combination with the lens-clip having a rim portion and an angular-bodied clamping-post projecting outwardly from said rim, of separate members strung upon said angular body so as to be held from rotation thereon and means for clamping said members on the post.

2. The combination with the lens-clip having a rim portion provided with an angular countersunk perforation in the plane of the lens, of an angular-bodied clamping-post having its head seated in said countersunk perforation so as to be held from rotation therein, a bow and guard perforated to fit the angular body of the bolt and strung thereon, and means for clamping said bow and guard on the post.

3. The combination with the lens-clip having a rim portion provided with an angular countersunk perforation in the plane of the lens, of an angular-bodied clamping-post having its head seated in said perforation so as to be held from rotation therein, a distance-piece nose-bridge and guard strung upon said angular body so as to be held from rotation thereon, and means for clamping said members on the post.

709,893. TYPE-WRITING MACHINE. MATTHEW S. BYLES, New York, N. Y., assignor to Hiett & Hatch Book Typewriter Company, a Corporation of New York. Filed Jan. 17, 1902. Serial No. 90,213. (No model.)

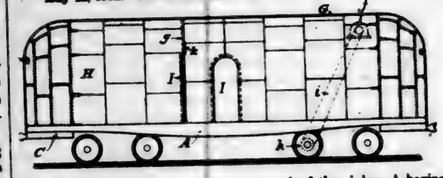


Claim.—1. In a type-writing machine, the combination of a flat bed or platen, a paper-confining frame, movable in relation to the platen and subporting therewith to confine the paper thereon, and an insulating-sheet connected with and supported by said frame.

2. In a type-writing machine, the combination of the platen A, the paper-confining frame B, the bar H attached to said frame, and an insulating-sheet O carried by the bar.

3. In a type-writing machine, the combination of a flat platen A, a subporting relatively movable paper-confining frame B, a downwardly-acting writing mechanism, an insulating-sheet G, a support H for said sheet, and means connecting said support to the frame B that it may be moved laterally thereon.

709,894. MAIL-CAR. PATRICK J. FARRELL, Joliet, Ill. Filed May 13, 1902. Serial No. 107,051. (No model.)

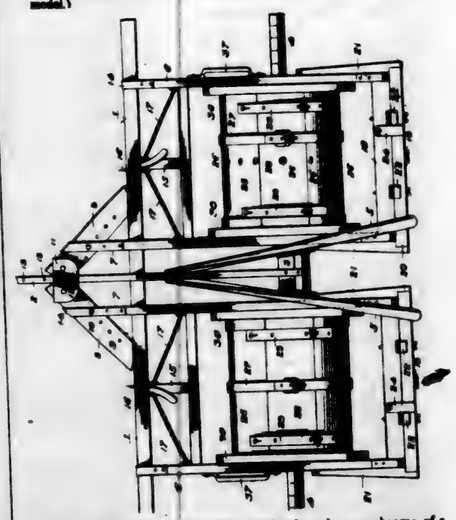


Claim.—1. In a car, a frame composed of the girders A having their end portions bent as shown, longitudinal beams B arranged between the girders, transverse beams B', ribs F formed of T-bars, and the bar G, extending from end to end of the car and having its ends secured to the girders and bent as shown.

2. In a car, the ribs F composed of T-irons, sheet-metal plates riveted to the flanges of the bars and forming the sheathing of the car, the lining V spaced from the sheathing, and means for securing the lining in place consisting of bars or plates bolted to the ribs and having their outer edges bearing against said lining, substantially in the manner shown.

3. In a car, girders A formed of angle-irons and having their ends bent as shown, an outer car-floor *b* resting on said girders, the sheathing U, angle-irons *a* extending around the corner formed by the junction of the bottom plate *b* and the sheathing U, and the upper floor-plate *c*, said floor-plates angle-iron and girder being riveted together, substantially as shown.

709,895. COTTON-PLANTER. WILLIAM FURLOW, Monroe county, Miss., assignor of two-thirds to W. R. Parker and Julius Frank, Jr., Monroe county, Miss. Filed Feb. 10, 1902. Serial No. 93,384. (No model.)



Claim.—The combination with a fixed axle and a cross-beam; of a tongue secured thereto, frames slidably mounted on the beam and axle, links adjustably connecting the tongue and frames, a drum in each frame and revolubly mounted on the axle, means in each drum for locking the frame against lateral movement on the axle, means for closing discharge-apertures in the drums, plows in advance of, and in alinement with the apertures in the drums, vertically-movable shovels secured to the frame in rear of the drums, and means for locking the shovels in operative position

---

709,896. FUME-ARRESTER. ANDREW W. GILLILAND, St. Louis, Mo. Filed Apr. 18, 1901. Serial No. 56,057. (No model.)

Claim.—1. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, and openings in said partitions at alternately opposite ends and near the floor-level only, as set forth.

2. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions at alternately opposite ends and near the floor-level only, and means in one or more of the compartments for cooling the gases passed through them, as set forth.

3. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions, and means in one or more of the compartments, extending up from the floor of each compartment between said openings, for cooling the gases passed through them, as set forth.

4. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions at alternately opposite ends and near the floor-level only, and a cooling-passage in one or more of said compartments, communicating with the external atmosphere, as set forth.

5. A fume-arrester, comprising a compartment having an inlet and outlet, and a cooling-passage in said compartment, communicating with the external atmosphere, and having a roof of such pitch that any solid particles deposited thereon will slide off, as set forth.

6. A fume-arrester, comprising a compartment having an inlet and outlet, a cooling-passage in said compartment, communicating with the external atmosphere, and doors in the walls of said passage for the removal of precipitated fume, as set forth.

7. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions at alternately opposite ends, and a cooling-passage in one or more of said compartments, communicating at each of its ends with the external atmosphere, as set forth.

8. A fume-arrester, comprising a chamber, divided into compartments by transverse partitions, openings in said compartments at alternately opposite ends, and a cooling-passage in one or more of said compartments, communicating with the external atmosphere, and having a roof of such pitch that any solid particles deposited thereon will slide off, as set forth.

9. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions at alternately opposite ends, a cooling-passage in one or more of said compartments, communicating with the external atmosphere, and doors in the walls of said passage for the removal of precipitated fume, as set forth.

10. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions at alternately opposite ends, and cooling-passages in each of said compartments, said passages communicating at each of their ends with the external atmosphere, and having steep-pitched roofs and doors for the removal of precipitated fume, as set forth.

11. A cooling-tower having vertical passages communicating at their upper ends, a fume-inlet and a vertical series of removable superposed screens in one of said passages, an outlet from the other passage, and means for spraying water down each of said passages, as set forth.

12. A cooling-tower having its lower end extending down into a water-tank, vertical passages in said tower, communicating at their upper ends and opening below into said tank, a fume-inlet to one passage and an outlet from the other passage, as set forth.

13. A cooling-tower having its lower end extending down into a water-tank, vertical passages in said tower, communicating at their upper ends and opening below into said tank, a fume-inlet and a vertical series of superposed screens in one of said passages, an outlet from the other passage, and means for spraying water down both of said passages, as set forth.

14. A cooling-tower having its lower end arranged in a water-tank, a lateral outlet in the lower end of said tower, and adjustable means for varying the height of said outlet, as set forth.

15. A cooling-tower having its lower end extending down into a water-tank, means for spraying water down said tower, a filter, and a passage leading from the water-tank to the filter, as set forth.

16. A cooling-tower having its lower end extending down into a water-tank, vertical passages in said tower, communicating at their upper ends, and opening below into said tank, a fume-inlet to one passage, and an outlet from the other, and a filter connected with said water-tank, as set forth.

17. A cooling-tower having its lower end extending down into a water-tank, vertical passages in said tower communicating at their upper ends and opening below into said tank, a fume-inlet and a vertical series of superposed screens in one of said passages, an outlet from the other passage, means for spraying water down both of said passages, and a filter connected with said water-tank, as set forth.

18. A cooling-tower having its lower end arranged in a water-tank, vertical passages in said tower, communicating at their upper ends and opening below into said tank, a fume-inlet to one of said passages, a lateral outlet from the other passage into said water-tank, and adjustable means for varying the height of said outlet, as set forth.

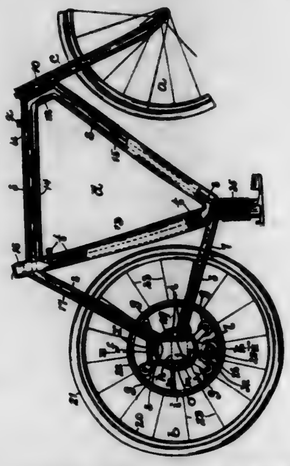
19. A fume-arrester, comprising a chamber divided into compartments by transverse partitions, openings in said partitions at alternately opposite ends, a cooling-passage in each of said compartments, communicating at each of its ends with the external atmosphere, a cooling-tower communicating with the last compartment and having its lower end arranged in a water-tank, vertical passages in said tower communicating at their upper ends and opening below into said tank, a vertical series of superposed screens in one of said passages, and means for spraying water down each of said passages, as set forth.

709,897. MOTOR-VEHICLE. FRANK C. GODDARD, Akron, Ohio. Filed Sept. 9, 1901. Serial No. 74,801. (No model.)

Claim.—1. The combination, with the framework of a vehicle, a driving-wheel, and an explosive-engine having its cylinder rigid with the framework, of a mixing-chamber having an air-inlet, a port arranged to conduct the combustible mixture from the said chamber to the chamber of the cylinder, a passage-way for supplying the gaseous or vaporous fluid to the said mixing-chamber, and a valve having a port adapted to register with the discharging end of the said passage-way and having another port for registering with the aforesaid air-inlet, and the arrangement of parts being such that the said air-inlet will be in registry with one of the valve-ports when the other valve-port is in registry with the aforesaid passage-way.

2. The combination, with the framework of a vehicle, the driving-wheel having a centrally-located hub, and an explosive-engine having its cylinder rigid with the framework, of a cylindrical case forming a mixing-chamber having an air-inlet, a port arranged to conduct the combustible mixture from the said chamber to the chamber of the cylinder, a passage-way for supplying the gaseous or vaporous fluid to the said mixing-chamber, and a rotary valve-forming ring having a port adapted to register with the discharging end of the said passage-way and having another port for registering with the aforesaid air-inlet, and the arrangement of parts being such that the said air-inlet will be in registry with one of the valve-ports when the other valve-port is out of registry with the aforesaid passage-way.

2. A motor-vehicle having a framework comprising tubular members forming a reservoir, a driving-wheel, an explosive-engine which has its shaft operatively connected with the said wheel and has its cylinder rigid with the framework and provided with a port for supplying the combustible fluid to the chamber of the cylinder, a mixing-chamber communicating with the said port, a passage-way arranged to conduct gas or vaper from the aforesaid reservoir to the mixing-chamber, and means for regulating the supply of air and combustible fluid to the mixing-chamber.



4. In a motor-vehicle, a driving-wheel, an explosive-engine operatively connected with the said wheel and having a cooling-jacket, a reservoir for supplying the combustible fluid for use in operating the engine, and a pipe-line extending through the reservoir and having opposite ends thereof in open relation with the chamber of the jacket, substantially as and for the purpose set forth.

5. The combination of the driving-wheel of a motor-vehicle, an explosive-engine operatively connected with the said wheel, an oil-reservoir, a passage-way arranged to conduct vaper-laden air from the reservoir, means for supplying fluid from the said passage-way to the chamber of the cylinder, and an air-pipe arranged to discharge into the oil-space of the said reservoir.

6. The combination of a driving-wheel of a motor-vehicle, an explosive-engine operatively connected with the said wheel, a tubular framework forming an oil-reservoir and a passage-way arranged to conduct vapor-laden air from the upper portion of the said reservoir, means for supplying fluid from the said passage-way to the chamber of the cylinder, and an air-pipe arranged to discharge air into the oil-space or lower portion of the said reservoir.

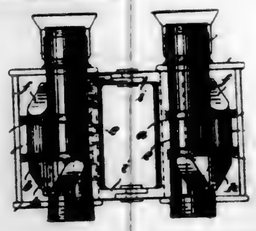
7. In a motor-vehicle, a driving-wheel, an explosive-engine operatively connected with the said wheel and having a cooling-jacket, a reservoir, a passage-way for conducting fluid from the reservoir to the engine, and a pipe-line having opposite ends communicating with the chamber of the jacket and extending interiorly of the aforesaid reservoir.

8. In a motor-vehicle, a driving-wheel, an explosive-engine operatively connected with the driving-wheel and having a cooling-jacket, the tubular framework forming a reservoir and a passage-way for conducting fluid from the said reservoir to the engine, and a pipe-line having opposite ends communicating with the chamber of the jacket, which pipe-line extends interiorly of and along the aforesaid passage-way.

709,898. BINOCULAR PRISM-TELESCOPE. CARL P. GOERZ, Friedenau, near Berlin, Germany. Filed May 1, 1901. Serial No. 58,319. (No model.)

Claim.—1. A binocular prism-telescope comprising a plurality of telescopes, prisms, a bridge uniting the telescopes, said bridge being provided with means for altering the distance of the axis of the telescopes and constructed to itself serve as a support for the optical systems, substantially as described.

2. A binocular prism-telescope, comprising two sets of perforated plates, each set comprising a pair of plates with spacing-tubes therebetween, an ocular tube and prism carried by one, an objective and a second prism carried by the other plate, a bridge uniting the two single telescopes and serving directly as carriers and supports for the single optical systems, substantially as described.

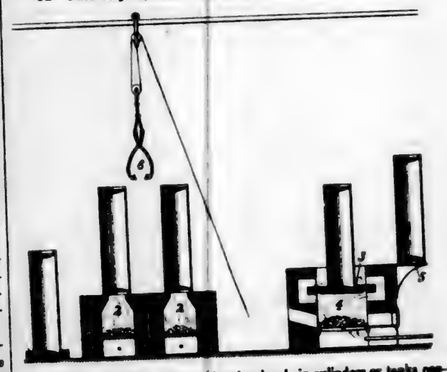


3. A binocular prism-telescope comprising two sets of perforated plates, each set comprising a pair of plates with spacing-tubes therebetween, an ocular tube and prism carried by one, an objective and a second prism carried by the other plate, a bridge uniting the two single telescopes and serving directly as carriers and supports for the single optical systems, and means for adjusting the distance of the axis of the telescopes.

4. A binocular prism-telescope comprising two sets of perforated plates, each set comprising a pair of plates with spacing-tubes therebetween, an ocular tube and a prism carried by one plate, an objective and a second prism carried by the other plate, two adjustable bridges uniting the two single telescopes together and formed at their ends directly as supports and carriers for the single optical systems, and means carried by said bridges for altering the distance of the axis of the telescopes, substantially as shown and described.

5. A binocular prism-telescope comprising two sets of perforated plates, each set comprising a pair of plates with spacing-tubes therebetween, an ocular tube and a prism carried by one plate, an objective and a second prism carried by the other plate, two adjustable bridges uniting the two single telescopes together and formed at their ends directly as supports and carriers for the single optical systems, means carried by said bridges for altering the distance of the axis of the telescopes, and a separate covering for each of said systems.

709,899. PROCESS OF BRAZING. HORACE E. CRAFT, Pittsburg, Pa. Filed May 11, 1900. Serial No. 16,308. (No specimens.)

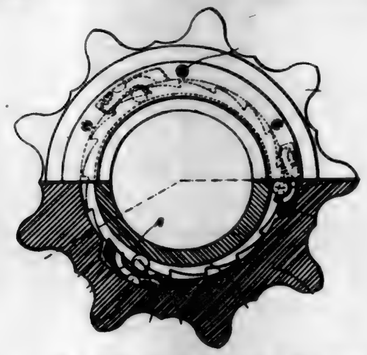


Claim.—1. The process of brazing heads in cylinders or tanks consisting in heating the head to at least a red heat, and then dipping into a pot of molten brazing metal; substantially as described.

2. The method of brazing heads in cylinders or tanks, consisting in placing the heads within the end of the cylinder, heating the central portion of the head to at least a red heat and then dipping the flanges into a pot of molten brazing metal; substantially as described.

709,900. FREE-WHEEL OR LIKE CLUTCH. WILLIAM H. OSBURY and SAMUEL L. TAYLOR, Falmouth, England. Filed Mar. 6, 1901. Serial No. 50,096. (No model.)

Claim.—1. In a clutch, the combination of a driving member, a driven member, ratchet-teeth carried by one member between the driving and driven members, a cylindrical surface adjacent to the teeth and carried by the same member, a rocking pawl carried loosely by the other member to rotate with it and move relatively thereto, a rolling body situated between the pawl and the cylindrical surface and which rocks the pawl into and out of engagement with the teeth and a spring which maintains the rolling body in contact with the cylindrical surface, substantially as set forth.



2. In a clutch, the combination of a driving member, a driven member, ratchet-teeth carried by one member between the driving and driven members, a cylindrical surface adjacent to the teeth and carried by the same member, a rocking pawl carried loosely by the other member and separate from it, a rolling body situated between the pawl and the cylindrical surface and which rocks the pawl both into and out of engagement with the teeth and a spring which maintains the rolling body in contact with the cylindrical surface, substantially as set forth.

3. In a clutch, the combination of a driving member, a driven member, ratchet-teeth carried by one member between the driving and driven members, a cylindrical surface adjacent to the teeth and carried by the same member, a stationary rocking pawl carried by the other member, a rolling body situated between the pawl and cylindrical surface and a spring carried by the pawl and disposed between the pawl and rolling body, substantially as set forth.

4. In a clutch, the combination of a driving member, a driven member, ratchet-teeth carried by one member between the driving and driven members, a cylindrical surface adjacent to the teeth and carried by the same member, a recess in the other member, a stationary rocking pawl carried in this recess, a rolling body situated between the pawl and the cylindrical surface, and a spring to maintain the rolling body in contact with the cylindrical surface, substantially as set forth.

5. In a clutch, the combination of a driving member, a driven member, ratchet-teeth carried by one member between the driving and driven members, a cylindrical surface adjacent to the teeth and carried by the same member, a recess in the other member, a stationary rocking pawl carried in this recess, a rolling body situated between the pawl and cylindrical surface, and a spring carried by the pawl and disposed between the pawl and rolling body, substantially as set forth.

6. In a clutch, the combination of a driving member, a driven member concentric with the driving member, ratchet-teeth carried on the periphery of one member, a cylindrical surface adjacent to the teeth and carried by the same member, a rocking pawl carried by and fulcrumed loosely on the other member which is formed annular, a rolling body situated between the pawl and cylindrical surface to rock the pawl into and out of engagement with the teeth and a spring to maintain the rolling body in contact with the cylindrical surface, substantially as set forth.

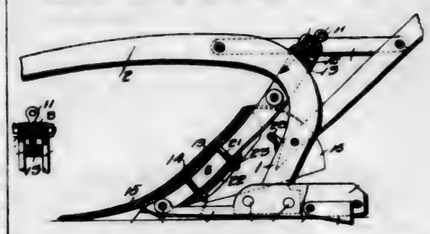
7. In a clutch, the combination of a driving member, a driven member concentric with the driving member, ratchet-teeth carried on the periphery of one member, a cylindrical surface adjacent to the teeth and carried by the same member a rocking pawl carried by and fulcrumed loosely on the other member which is formed annular, a rolling body situated between the pawl and cylindrical surface and a spring carried by the pawl and disposed between the pawl and rolling body, substantially as set forth.

8. In a clutch, the combination of a driving member, a driven member concentric with the driving member, ratchet-teeth carried on the periphery of one member, a cylindrical surface adjacent to the teeth and carried by the same member, a recess in the other member which is formed annular and lies outside the ratchet-teeth, a stationary rocking pawl carried in this recess, a rolling body situated between the pawl and cylindrical surface, and a spring carried by the pawl and disposed between the pawl and rolling body, substantially as set forth.

9. In a clutch, the combination of an inner member carrying ratchet-teeth on its periphery and a cylindrical surface adjacent to the teeth, an outer annular member, a recess in this member, a stationary rocking pawl carried in this recess, a rolling body situated between the pawl and the cylindrical surface of the inner member and a spring carried by the pawl and situated between the pawl and the rolling body substantially as set forth.

10. In a clutch, the combination of an inner member carrying ratchet-teeth on its periphery and a cylindrical surface adjacent to the teeth, an outer annular member, a recess in this member, a stationary rocking pawl carried in this recess, a recess in this pawl, a rolling body situated in the recess in the pawl and between the pawl and the annular surface of the inner member and a spring carried by the pawl and situated between the pawl and rolling body, substantially as set forth.

709,901. PLOW. ELIAS HANKINS, Purdon, Tex. Filed May 28, 1902. Serial No. 109,373. (No model.)



Claim.—1. In a plow, the combination of the beam, the landside secured at the lower end of the depending part of the same and having a forwardly-extended portion, the bifurcated stock or standard connected pivotally with the front end of the landside, a nut interposed between the upper ends of the side pieces constituting said stock and having laterally-extending pins extending through and connected with the sides of said stock, an eyebolt mounted in said nut, and a toothed slide pressed by said bolt against the curved portion of the beam, substantially as set forth.

2. In a plow, the combination of the beam, the landside connected with the lower end of said beam and having a forwardly-extended portion, the bifurcated stock having pivotal connection with the front end of the landside, a swiveled nut interposed between the sides of the said bifurcated stock at the upper end of the same, a bolt in said swiveled nut, and a toothed plate adapted to be pressed by said bolt against the curved portion of the beam, substantially as set forth.

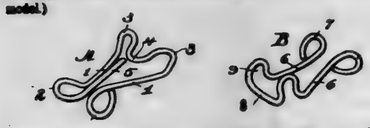
3. In a plow, the combination with the bifurcated stock having pivotal connection with the landside and means for securing it in position, of the V-shaped plate mounted upon said bifurcated stock and having at its lower end a downturned nose bearing against the point of said stock, and the point and moldboard constituting a breaking-plow mounted securely upon said V-shaped plate, substantially as set forth.

4. In a plow, the combination with the bifurcated stock having pivotal connection with the landside and means for securing it in position, of a V-shaped plate having its edge flattened to receive bolts whereby it is connected with the bifurcated standard, said V-shaped plate being provided at its lower edge with a downturned point engaging against the point of the bifurcated stock, the point and moldboard constituting a double breaking-plow mounted securely upon said V-shaped plate, and a brace having its end detachably connected with the under sides of the rims of the moldboard, substantially as set forth.

5. In a plow, the combination with the beam, of the landside composed of two separate parts mounted on opposite sides of the enlarged lower end of the depending portion of the beam, one of said parts being provided with an enlargement forming a seat or washer on its inner side, a knife or cutter mounted pivotally between the parts constituting the landside adjacent to the seat or washer, a bolt connecting the sides of said landside in rear of said knife which may thus be clamped and held at any desired adjustment, and an extension of one of the parts of the landside having pivotal connection with the lower end of the plow-standard, substantially as set forth.

6. In a plow, the combination with the bifurcated stock having pivotal connection with the landside and means for securing it in position, of a V-shaped plate having its edge flattened to receive bolts whereby it is connected with the bifurcated standard, said V-shaped plate being provided at its lower edge with a downturned point engaging against the point of the bifurcated stock, the point and moldboard constituting a double breaking-plow mounted securely upon said V-shaped plate, plates connecting the abutting edges of said point and moldboard, on the under sides thereof, adjacent to the V-shaped plate, and a brace having its ends detachably connected with the under sides of the wings of the moldboard, substantially as set forth.

709,902. HOOK AND EYE. JOHN R. HAZE, New York, N. Y. Filed Apr. 19, 1901. Renewed Feb. 24, 1902. Serial No. 95,147. (No model.)



Claim.—1. In a hook and eye, the combination with an eye having a flat base and at its engaging end a bail with an inwardly-bent bight, and having a spring locking prong or member which extends forward substantially to said bight, the bight and the free end of said locking member being elevated above said base, in combination with a hook having a base, and a downwardly-curved loop-like bill which takes over the bight of the eye and interlocks with said locking member.

2. A hook having a closed loop-like bill, arched at 9 and with its tip 8 directed downward, in combination with an eye having a bail with an elevated bight 4, and a spring locking member 5 having its free end elevated above the base or main portion of the eye and adjacent to said bail, the bill of the hook taking over the said bight of the eye and interlocking with the locking member of the eye, substantially as and for the purpose set forth.

3. The combination with an eye A, having a base portion which rests on the fabric, a bail with an inwardly-bent bight 4 elevated above the level of the base and with a locking-tongue, the free end of which is also elevated above the base, of a hook B, having a base portion which rests on the fabric, an elevated, arched, loop-like bill adapted to take over and interlock with the bail and said locking-tongue of the eye, substantially as and for the purpose set forth.

709,903. ASPHALT-HOE. SMITH HARPER, Abington township, Montgomery county, Pa., assignor to Smith Harper, Charles S. Harper, and Frank W. Harper, trading as Smith Harper & Sons. Filed Dec. 7, 1901. Serial No. 85,053. (No model.)

Claim.—1. In an asphalt-hoe, a blade, a shank therefor, a handle for the shank, a scraper-plate in alinement with the hoe-plate and having an aperture for the insertion of the shank, and means to secure the plate to the blade aforesaid, in alinement therewith and at the blade's upper part so that the plate shall extend above the upper edge of the blade, and above its shank.

2. In an asphalt-hoe, a blade, an integral shank therefor, a ferrule and a handle secured to the shank, a plate secured to the blade in alinement therewith and projecting beyond the upper edge of the blade, an aperture in the plate through which the shank is inserted, and an upper edge to the aperture adapted to closely fit the shank and thereby support it to resist the pressure upon the front of the plate.

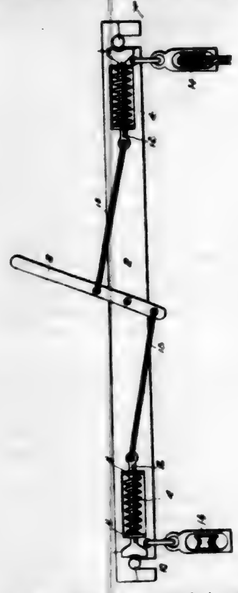
3. In an asphalt hoe and scraper, a blade, a shank integral with the blade, the shank upwardly tending and backwardly curved, a handle secured to the shank so that the blade shall stand at about an angle of sixty degrees from a horizontal line at its working edge; a scraper-plate secured to the blade at its upper part, and in alinement therewith, an aperture in the scraper-plate having its upper side formed to closely fit and be supported against the curve of the shank at a point below its highest part.

709,904. SADDLE. JOHN R. HASTINGS and CLARENCE R. HASTINGS, Longmont, Tex. Filed July 29, 1901. Serial No. 69,423. (No model.)

Claim.—A saddle of the class set forth, comprising a tree having the usual seat portion, cantle, front horn and front leg-support, a sheet-metal covering for the seat having a front projecting portion between the horn and leg-support and laterally-projecting front flanges around the front and outer side portions of the bases of the said horn and leg-support to thereby provide a substantially smooth surface for the application of other coverings, a girth-rigging, and skirtings and other coverings for the several parts.

709,904.

709,905. HOISTING AND TRANSPORTING DEVICE. WILLIAM H. HATFIELD, Wade, Ill. Filed Oct. 30, 1901. Serial No. 80,572. (No model.)



Claim.—1. In hoisting and transporting devices of the character described a carriage comprising a frame, legs thereto, and alining holders thereon having a space formed between their adjacent ends.

2. In hoisting and transporting devices of the character described, the combination with a frame having legs thereto; of supporting-bails at the ends of the frame, and U-shaped holders arranged in alinement upon the frame, a space being formed between their adjacent ends.

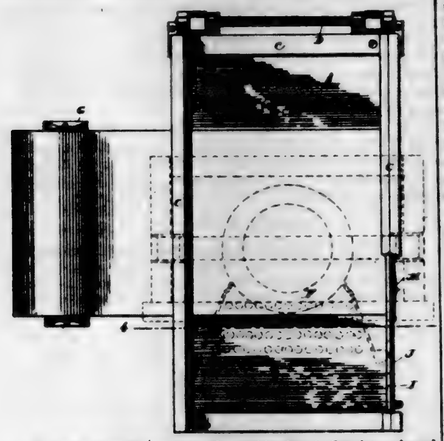
3. In hoisting and transporting devices of the character described the combination with supporting-rods; of a cross-beam having slots for the reception of the rods, clamping-blocks upon the beam normally engaging the rods, means for retracting the blocks, and a carriage suspended from the beam.

4. The combination with a carriage comprising a frame, holders thereon and bails extending from the frame; of a cross-beam having slots therein, blocks adapted to project over the slots, a spring-controlled stem to each block, a lever pivoted to the beam, and links connecting the lever and stems, whereby the blocks may be simultaneously retracted, pulleys suspended from the beams, and a cable mounted on each pulley and connected to a bail.

709,906. TYPE-WRITING MACHINE. CLARENCE F. HOPKINS, New York, N. Y., assignor to Hlett & Hatch Book Typewriter Company, a Corporation of New York. Filed Mar. 26, 1902. Serial No. 100,070. (No model.)

Claim.—1. In a type-writing machine, the combination of a flat platen, a downwardly-writing mechanism movable thereover, means for delivering a web of paper across the platen, means for confining the paper on the platen during the printing operation, and a shearing mechanism

located beyond the printing field and acting independently of the writing mechanism to sever the printed end of the sheet from the remainder.



2. In a type-writing machine, the combination of a flat platen adapted to sustain the paper to be written upon, a frame cooperating with the platen to confine the paper thereon, and a shearing device connected with said frame and arranged to operate independently of the writing mechanism.

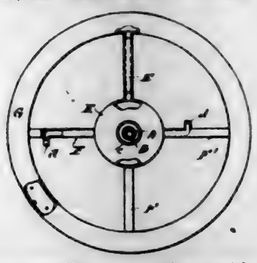
3. In a type-writer and in combination with a downwardly-acting writing mechanism movable thereover, a flat platen to sustain the paper, a vertically-movable frame acting to confine the paper upon the platen, and two shearing-blades attached respectively to the platen and the frame.

4. In a type-writer, the combination of a flat platen, means located at one side of the platen for sustaining a roll or web of paper, means at the opposite side of the platen for confining the paper thereto, and a shearing device connected with the paper-confining means whereby the printed end of the sheet may be severed from the remainder and the newly-formed end confined in position.

5. In a type-writing machine and in combination with the writing mechanism, means for sustaining a roll of paper and delivering one end across the printing field, means for confining the paper in position during the printing operation, and a shearing mechanism connected with and operated by said paper-confining means.

6. In a type-writing machine, the combination of the fixed platen, a traveling writing mechanism thereover, a rising and falling frame to confine the paper upon the platen, a shearing device connected to said frame, a foot-lever and lifting connections from the lever to the frame.

709,907. SPRINKLER-HEAD. PAUL HUNNIUS, Milwaukee, Wis. Filed Mar. 20, 1902. Serial No. 98,592. (No model.)

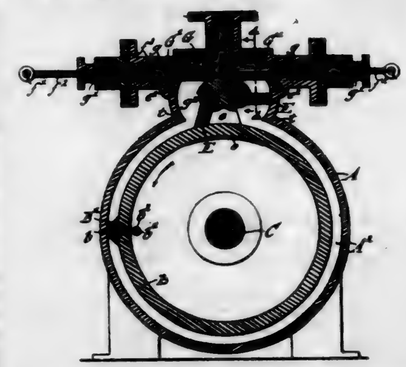


Claim.—1. A sprinkler-head comprising a straight apertured tube closed at one end and provided with bearing-collars one of which is adjustable, a hollow hub loose on the tube to inclose the apertures of same and provided with diametrically opposite sockets engaged by the bearing-collars, hollow distributing-spokes that being in connection with the hub have their outlets at different distances from the same, and a perforated annular tube in connection with the said spokes.

2. A sprinkler-head comprising a straight apertured tube closed at one end and provided with bearing-collars one of which is adjustable, a hollow hub loose on the tube to inclose the apertures of same and provided with diametrically opposite sockets engaged by the bearing-collars, spokes in connection with the hub, and a perforated annular tube in connection with the spokes some of which are hollow their entire length to establish communication between said hub and annular tube, the remainder being partly hollow outward from the aforesaid hub and having their outlets at different intervals of the radius.

3. A sprinkler-head comprising a straight apertured tube having a bearing-collar rigid thereon, a plug in screw-thread connection with one end of the tube, a bearing-collar in like connection with said plug, a hollow hub loosely on said tube to inclose its apertures and provided with diametrically opposite sockets engaged by the bearing-collars, spokes in connection with the hub, and a perforated annular tube in connection with the spokes some of which are hollow their entire length to establish communication between said hub and annular tube, the remainder being partly hollow outward from the aforesaid hub and having their outlets at different intervals of the radius.

709,908. ROTARY ENGINE. WALTER JAMESON, Brooklyn, N. Y., assignor to John Jameson, Brooklyn, N. Y. Filed Nov. 5, 1901. Serial No. 81,173. (No model.)



Claim.—1. A rotary engine, consisting of a cylindrical casing, a cylindrical rotary piston in said casing, an abutment on said piston, a valve-chest on said casing provided with steam inlet and outlet ports, said inlet-port having two openings into the valve-chest, two swinging abutments in said valve-chest, independent reciprocating supply-valves located in said valve-chest, one for each of said inlet-port openings, means for oscillating one of said swinging abutments during each rotation of the piston, and means for reciprocating either of said supply-valves independently of the other, substantially as set forth.

2. A rotary engine, consisting of a cylindrical casing, a cylindrical rotary piston in said casing, an abutment on said piston, a valve-chest on said casing provided with steam inlet and outlet ports, said inlet-port having two openings, one at either side, into the valve-chest, independent reciprocating supply-valves each controlling independently one of said openings, channels, one at each side, communicating with said openings and with the interior of the casing, swinging abutments, one in each channel, adapted to close the same when in raised position, means for maintaining either abutment in raised position, means for maintaining the corresponding supply-valve in closed position, and means for independently reciprocating the other supply-valve, substantially as set forth.

3. A rotary engine, consisting of a cylindrical casing, a cylindrical rotary piston in said casing, an abutment on said piston, a valve-chest on said casing provided with steam inlet and outlet ports, two swinging abutments arranged in the lower part of said valve-chest, reciprocating supply-valves located at the opposite ends of said valve-chest, operating-rods provided with hooked ends and connected with the stems of said supply-valves, a rocking lever engaging one of said operating-rods at a time, a cam on the piston-shaft for actuating said rocking lever, thumb-levers pivoted to the valve-chest, means connecting said thumb-levers with the swinging abutments, and a reversing mechanism connecting said thumb-levers, substantially as set forth.

4. The combination, with a cylindrical casing, of interior segmental cams on the heads of said casing, a cylindrical rotary piston in said casing, an abutment on said piston, a packing for said abutment, and a spring-actuated stirrup connected with said packing, and adapted to be engaged by the segmental cams on the heads of the casing for withdrawing the packing into the piston-abutment while the latter passes over the supply and exhaust ports of the engine, substantially as set forth.

5. The combination, with a cylindrical casing, of a cylindrical rotary piston in the same, an abutment on said piston, a packing, means for holding said packing below the edge of the abutment when passing over the supply and exhaust ports of the casing, a valve-chest above the cylinder, provided with steam inlet and exhaust ports, reciprocating supply-valves at opposite ends of said chest, two swinging abutments in the lower part of the valve-chest, a valve-operating gear, a rocking lever engaging said valve-operating gear, a cam on the piston-shaft engaging said rocking lever, means for bringing either valve-operating gear into engagement with the rocking lever for operating the supply-valve, and means for simultaneously operating said swinging abutments, substantially as set forth.

6. In a rotary engine, the combination of a casing having an opening in its wall, a piston mounted rotatably in said casing, an abutment between said piston and cylinder, a packing carried by said abutment, means actuating said packing in outward direction toward the casing, and means drawing said packing in inward direction during the passage of the abutment over said opening, substantially as set forth.

709,909. GARMENT FASTENER OR SUPPORTER. JOEL JENKINS, Mt. Holly, N. J. Filed Jan. 24, 1902. Serial No. 91,622. (No model.)

Claim.—1. In a garment fastener or supporter, a supporting device having a loop formed upon its lower end, an opening formed upon its upper end, and an engaging projection secured upon the device directly above the lower loop.

2. In a garment fastener or supporter, a supporting device having a loop formed upon its lower end, openings formed upon its upper end, an engaging projection secured to the device directly above the said lower loop and adapted to engage the end of a suspender-strap or like supporting means, and means for attaching the device to the garment to be supported.

3. In a garment fastener or supporter, a device having a loop formed upon its lower end, loops formed upon its upper end through which a suspender-strap or like supporting means is adapted to engage, means intermediate of said upper end lower loops over which the end of the said suspender-strap is adapted to engage, and means for attaching the device to the garment to be supported.

4. In a garment fastener or supporter, a device having means upon one end for engaging the garment to be supported, means upon the opposite end for engaging a supporting-strap, and means intermediate of the aforesaid means comprising a tapering shank for securely holding the said strap in engagement with the device.

5. In a garment fastener or supporter, a supporting-loop having a contracted loop formation upon its lower end, openings upon its upper end, a tubular connection connecting the upper ends of the device and securely fastened to one of the ends, a tapering shank formed upon the device directly above the said supporting-loop, a strap having an engaging projection secured thereto engaging around the said tapering shank and adapted to move upon same, and means for attaching the device to the garment to be supported, substantially as described.

6. In a garment fastener or supporter, a supporting-loop having a contracted loop formation upon its lower end, openings upon its upper and through which a suspender-strap is adapted to engage, a tapering shank formed upon the device directly above the said supporting-loop, a strap having an engaging projection and engaging around the said tapering shank and adapted to move upon same when acted upon by the suspender-strap with which the said projecting lip is adapted to engage, and means for attaching the device to the garment to be supported, substantially as described.

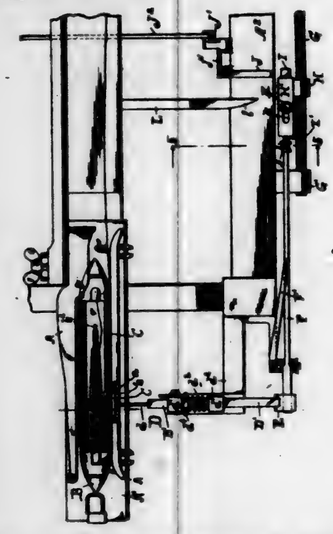
7. In a garment fastener or supporter, a supporting-loop provided with suitable means for attaching to a suspender or supporting strap, a tapering shank formed upon the device directly above the said supporting-loop, a strap having an engaging projection and, engaging around the said tapering shank and adapted to move upon same to contract the sides of the aforesaid supporting-loop, and a supporting-button fastened to the garment to be supported and adapted to engage with the said supporting-loop in combination with a supporting-strap or suspender to which the device is adapted to be attached, substantially as described.

8. In a garment fastener or supporter, means to engage a garment to be supported; means adjacent thereto comprising a tapering neck to receive a supporting-strap, whereby the pull upon the strap will cause the garment-engaging means to hold more securely.

9. In a garment fastener or supporter; means to engage a garment to be supported; means adjacent thereto comprising a tapering neck; a sleeve slidable on said neck; and a projection on said sleeve to receive a supporting-strap, whereby the pull upon the strap will cause the garment-engaging means to hold more securely.

10. In a device for engaging a suspender-end, means for detachably engaging said suspender-end; means to engage a garment to be supported; together with means adapted to project through the eye of the suspender-end for securely but detachably holding the supporting strap or band in engagement with the device.

709,910. MECHANISM FOR CONTROLLING LOOMS BY THE QUANTITY OF WEFT IN THE SHUTTLER. JOHANN H. KLEMT, Sunbury, Pa., assignor to Susquehanna Silk Mills, Sunbury, Pa., a Corporation of Pennsylvania. Filed Dec. 10, 1901. Serial No. 85,399. (No model.)



Claim.—1. In a loom the combination with the shuttle-box, of a movable feeler device, constructed and fitted to enter the shuttle in the shuttle-box when the lay beats up, whereby the movement of the feeler device is under control of the weft or filling in the shuttle, a lever device pivoted to oscillate in a plane substantially at right angles to the oscillation of said feeler device, means intermediate of said feeler device and said pivoted lever device, whereby the feeler device may effect such oscillation of the lever device so long as the weft is not exhausted in the predetermined point, a part for bringing about or controlling the operation of a weft or filling-removing mechanism or a loom-stop mechanism, and operative means intermediate of said part and a moving part of the loom, said means under control of the said lever device, whereby a loom-stop or filling-removing mechanism may be operated upon failure or substantial exhaustion of the weft or filling.

2. In a loom the combination of a to-and-fro moving member adapted to vibrate in harmony with the lay and under control of the weft or filling in the shuttle in play, a part for bringing about or controlling the operation of a loom-stop or filling-removing mechanism, mechanism adapted to intermittently actuate said part and a lever device pivoted to oscillate in a vertical plane through, and under control of the said to-and-fro moving member for preventing the actuation of such part, when the shuttle is well supplied with filling and for permitting its actuation upon the failure or substantial exhaustion of the weft or filling.

3. In a loom the combination of a movable feeler device constructed and fitted to enter the shuttle in play to press upon the weft therein, whereby the feeler device may vibrate in harmony with the lay, and its amplitude of vibration be under control of the filling or weft in the shuttle; mechanism for bringing about or controlling the operation of a loom-stop or filling-removing mechanism; a moving part of the loom adapted to engage and actuate the said controlling mechanism; a cam for placing said mechanism in inoperative position, and means under control of the said feeler device for engaging to retain in inoperative position said mechanism, whereby it may prevent the engagement of said moving part of the loom with said controlling mechanism to actuate it, until the failure or substantial exhaustion of the weft or filling in the shuttle, and then permit such engagement.

4. In a loom the combination with a feeler device vibrating in harmony with the lay, and under control of the weft or filling in the shuttle, a movable arm or member for bringing about or controlling the operation of a loom-stop or filling-removing apparatus, a power-actuated buntor, a reciprocating part carried on said movable arm or member adapted to be engaged by said buntor, whereby the movable arm or member is actuated, means to periodically reciprocate said reciprocating part to remove it from the action of said buntor, or into inoperative position, a catch device adapted to engage said reciprocating part to hold it in such inoperative position, while the said buntor passes its critical position, and means intermediate of the said feeler device and said catch device whereby the latter is moved periodically into operative position to prevent actuation of the aforesaid movable arm or member until the failure or substantial exhaustion of the weft.

5. In a loom the combination with a feeler device vibrating in harmony with the lay, its amplitude of vibration under control of the weft or filling in the shuttle, a rock-shaft for bringing about or controlling the operation of a loom-stop or filling-removing mechanism, and mechanism for actuating said rock-shaft comprising an arm extending from the rock-shaft, a reciprocating part carried on said arm, a continuously-moving buntor for engaging said reciprocating part to actuate said rock-shaft, and mechanism under control of the said feeler device for removing the said reciprocating part from the path of said buntor when the shuttle is well supplied with weft or filling.

6. In a loom the combination with the lay and the shuttle box thereof of the feeler device D vibrating in harmony with the lay, and adapted to enter the shuttle in the shuttle-box A, whereby the amplitude of vibration of the feeler device is under control of the filling or weft in the shuttle; a cam E' operated by the feeler device to oscillate a lever F so long as sufficient quantity of weft or filling remains in the shuttle; said lever F; a rock-shaft G for bringing about or controlling the operation of a loom-stop or filling-removing mechanism, an arm as H, connected to said shaft, a movable slide I carried on said arm, a buntor J adapted to coact with said slide I to actuate arm H, a cam L carried by the lay for shifting said slide I and engaging hook devices *i f* carried by said slide and said lever F respectively, substantially for the purpose described.

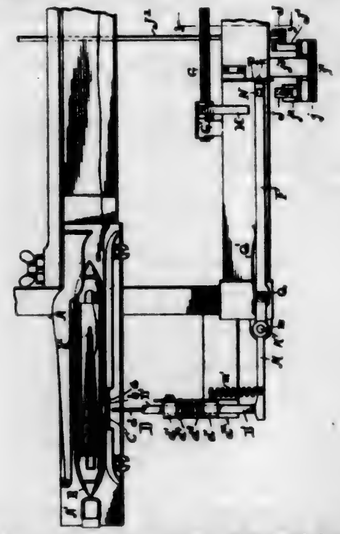
7. In a loom the combination with the lay of a movable arm or member for bringing about or controlling the operation of a weft-removing or loom-stop apparatus, a reciprocating part carried on said arm or member, a spring acting on said part to hold it in normal or operative position, means as a cam, for periodically moving said part against the action of said spring and an intermittently-actuated and weft-controlled device for engaging and holding said part in inoperative position, and a buntor for actuating said part when said weft-controlled device fails to engage the same, whereby a weft-removing or loom-stop mechanism may be brought into operation upon failure or substantial exhaustion of the weft in the shuttle.

8. In a loom the combination with the lay of a device fitted to move to and fro in harmony with the lay provided with a member for entering the shuttle to coact with the weft therein, whereby the amplitude of movement of said to-and-fro device is controlled by the quantity of weft in the shuttle; a buntor, and mechanism actuated thereby adapted to control or bring about the operation of a loom-stopping or weft-removing apparatus; means for intermittently moving said mechanism into inoperative position; and a lever device for intermittently maintaining said mechanism in such inoperative position; and means intermediate said lever device and said to-and-fro device for producing such intermittent movement of said lever device, until the amplitude of movement of said to-and-fro device reaches a predetermined point.

9. In a loom the combination with the lay of a feeler device adapted to move to and fro in harmony with the lay, its amplitude of movement under control of the weft in the shuttle; mechanism for bringing about or controlling the operation of a loom-stopping or filling-removing apparatus, said mechanism including a shifting block; a moving part of the loom for engaging said block to actuate said mechanism; a second moving part of the loom for shifting said block out of the path of said first-named moving part; means for returning said block to normal position; a lever device adapted and fitted to be oscillated by said feeler device until the weft is exhausted to a predetermined extent, and means intermediate of said lever device and said shifting block whereby said lever device may intermittently retain said shifting block in its inoperative position, and thereby prevent the operation of the loom-stopping or filling-removing mechanism until the predetermined exhaustion of weft.

10. In a loom the combination with the lay of the feeler device D for coacting with the weft in the shuttle in play, and operated to move to and fro in harmony with the vibrations of the lay, the oscillating lever device F, the cam E constituting means whereby the feeler device may oscillate the lever device when there is sufficient weft in the shuttle, the rock-shaft G adapted to be connected with loom-stopping, or weft-removing apparatus, the arm H carried thereon, the shifting block I fitted to said arm to actuate shaft G, the oscillating cam L for shifting said block I to inoperative position, and a hook *f* carried on said lever device F, adapted to retain said block I in inoperative position while the buntor J is actuated.

709,911. MECHANISM FOR CONTROLLING LOOMS BY THE QUANTITY OF WEFT IN THE SHUTTLER. JOHANN H. KLEMT, Sunbury, Pa., assignor to Susquehanna Silk Mills, Sunbury, Pa., a Corporation of Pennsylvania. Filed Dec. 10, 1901. Serial No. 85,398. (No model.)



Claim.—1. In a loom the combination with the lay of a lever device fitted to oscillate, means under control of the filling or weft in the shuttle in play, for effecting oscillations of said lever device in harmony with the vibrations of the lay, whereby such oscillations will be diminished in extent or amplitude in accordance with the quantity of weft or filling in the shuttle, a member for bringing about or controlling the operation of a loom-stop or filling-removing mechanism, a buntor for actuating said member, through the medium of said lever device, and means connected with said lever device for controlling the actuation of said member, whereby on the failure or substantial exhaustion of the weft in the shuttle in play, the operation of the loom-stop or filling-removing mechanism may be effected.

2. In a loom the combination with the lay of a lever device fitted to oscillate in harmony with the vibrations of the lay, means coacting with the weft or filling in the shuttle in play for effecting oscillations in said lever device in accordance with the quantity of weft or filling in the shuttle, a pivot contained in said lever to permit part thereof to be intermittently displaced independently of the main portion, a buntor adapted to effect such intermittent displacement, a member for bringing about or controlling the operation of a loom-stop or filling-removing mechanism, said member adapted to be actuated by said lever device when the latter is displaced by the said buntor, and means controlled by the oscillation of said lever device to prevent its engagement with either the buntor or with the said controlling member until the failure or substantial exhaustion of the weft or filling, and for then permitting such engagement.

3. In a loom the combination with the lay of a shuttle-box, a movable feeler device, constructed and fitted to enter the shuttle in the shuttle-box when the lay beats up, whereby the movement of the feeler device is under control of the weft or filling in the shuttle, a lever device operatively connected with said feeler device so as to oscillate in harmony with the vibration of the lay under control of the weft or filling in the shuttle, a member for bringing about or controlling the operation of a loom-stop or filling-removing mechanism, and operative means including

5. The combination, with a cylindrical casing, of a cylindrical rotary piston in the same, an abutment on said piston, a packing, means for holding said packing below the edge of the abutment when passing over the supply and exhaust ports of the casing, a valve-chest above the cylinder, provided with steam inlet and exhaust ports, reciprocating supply-valves at opposite ends of said chest, two swinging abutments in the lower part of the valve-chest, a valve-operating gear, a rocking lever engaging said valve-operating gear, a cam on the piston-shaft engaging said rocking lever, means for bringing either valve-operating gear into engagement with the rocking lever for operating the supply-valve, and means for simultaneously operating said swinging abutments, substantially as set forth.

6. In a rotary engine, the combination of a casing having an opening in its wall, a piston mounted rotatably in said casing, an abutment between said piston and cylinder, a packing carried by said abutment, means actuating said packing in outward direction toward the casing, and means drawing said packing in inward direction during the passage of the abutment over said opening, substantially as set forth.

709,909. GARMENT FASTENER OR SUPPORTER. JOEL JENKINS, Mrs. Atlantic, N. J. Filed Jan. 24, 1902. Serial No. 91,022. (No model.)

Claim.—1. In a garment fastener or supporter, a supporting device having a loop formed upon its lower end, an opening formed upon its upper end, and an engaging projection secured upon the device directly above the lower loop.

2. In a garment fastener or supporter, a supporting device having a loop formed upon its lower end, openings formed upon its upper end, an engaging projection secured to the device directly above the said lower loop and adapted to engage the end of a suspender-strap or like supporting means, and means for attaching the device to the garment to be supported.

3. In a garment fastener or supporter, a device having a loop formed upon its lower end, loops formed upon its upper end through which a suspender-strap or like supporting means is adapted to engage, means intermediate of said upper and lower loops over which the end of the said suspender-strap is adapted to engage, and means for attaching the device to the garment to be supported.

4. In a garment fastener or supporter, a device having means upon one end for engaging the garment to be supported, means upon the opposite end for engaging a supporting-strap, and means intermediate of the aforesaid means comprising a tapering shank for securely holding the said strap in engagement with the device.

5. In a garment fastener or supporter, a supporting-loop having a contracted loop formation upon its lower end, openings upon its upper end, a tubular connection connecting the upper ends of the device and securely fastened to one of the ends, a tapering shank formed upon the device directly above the said supporting-loop, a strap having an engaging projection secured thereto engaging around the said tapering shank and adapted to move upon same, and means for attaching the device to the garment to be supported, substantially as described.

6. In a garment fastener or supporter, a supporting-loop having a contracted loop formation upon its lower end, openings upon its upper end through which a suspender-strap is adapted to engage, a tapering shank formed upon the device directly above the said supporting-loop, a strap having an engaging projection and engaging around the said tapering shank and adapted to move upon same when acted upon by the suspender-strap with which the said projecting lip is adapted to engage, and means for attaching the device to the garment to be supported, substantially as described.

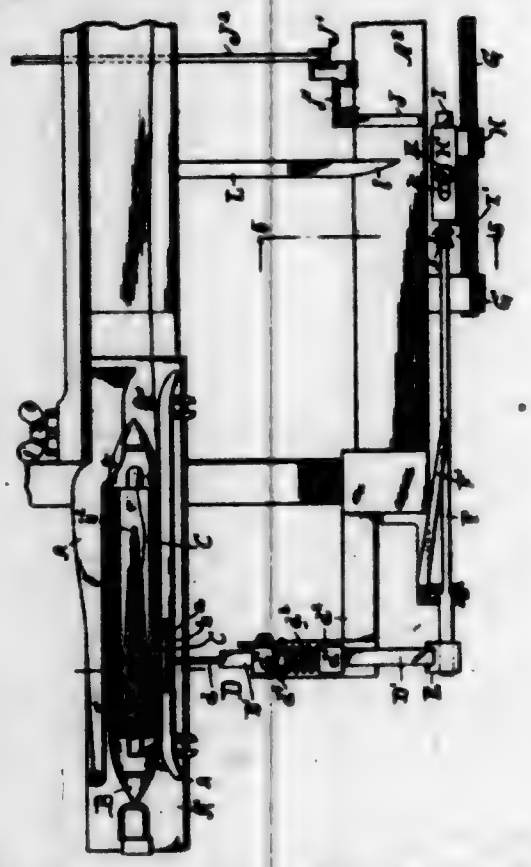
7. In a garment fastener or supporter, a supporting-loop provided with suitable means for attaching to a suspender or supporting strap, a tapering shank formed upon the device directly above the said supporting-loop, a strap having an engaging projection and, engaging around the said tapering shank and adapted to move upon same to contract the sides of the aforesaid supporting-loop, and a supporting-button fastened to the garment to be supported and adapted to engage with the said supporting-loop, in combination with a supporting-strap or suspender to which the device is adapted to be attached, substantially as described.

8. In a garment fastener or supporter, means to engage a garment to be supported; means adjacent thereto comprising a tapering nook to receive a supporting-strap, whereby the pull upon the strap will cause the garment-engaging means to hold more securely.

9. In a garment fastener or supporter; means to engage a garment to be supported; means adjacent thereto comprising a tapering nook; a sleeve slidable on said nook; and a projection on said sleeve to receive a supporting-strap, whereby the pull upon the strap will cause the garment-engaging means to hold more securely.

10. In a device for engaging a suspender-end, means for detachably engaging said suspender-end; means to engage a garment to be supported; together with means adapted to project through the eye of the suspender-end for securely but detachably holding the supporting strap or band in engagement with the device.

709,910. MECHANISM FOR CONTROLLING LOOMS BY THE QUANTITY OF WEFT IN THE SHUTTLES. JOSIAH H. KLEEK, Sunbury, Pa., assignor to Susquehanna Silk Mills, Sunbury, Pa., a Corporation of Pennsylvania. Filed Dec. 10, 1901. Serial No. 85,269. (No model.)



Claim.—1. In a loom the combination with the shuttle-box, of a movable feeler device, constructed and fitted to enter the shuttle in the shuttle-box when the lay beats up, whereby the movement of the feeler device is under control of the weft or filling in the shuttle, a lever device pivoted to oscillate in a plane substantially at right angles to the oscillation of said feeler device, means intermediate of said feeler device and said pivoted lever device, whereby the feeler device may effect such oscillation of the lever device so long as the weft is not exhausted to the predetermined point, a part for bringing about or controlling the operation of a weft or filling-renewing mechanism or a loom-stop mechanism, and operative means intermediate of said part and a moving part of the loom, said means under control of the said lever device, whereby a loom-stop or filling-renewing mechanism may be operated upon failure or substantial exhaustion of the weft or filling.

2. In a loom the combination of a to-and-fro moving member adapted to vibrate in harmony with the lay and under control of the weft or filling in the shuttle in play, a part for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism, mechanism adapted to intermittently actuate said part and a lever device pivoted to oscillate in a vertical plane through, and under control of the said to-and-fro moving member for preventing the actuation of such part, when the shuttle is well supplied with filling and for permitting its actuation upon the failure or substantial exhaustion of the weft or filling.

3. In a loom the combination of a movable feeler device constructed and fitted to enter the shuttle in play to press upon the weft therein, whereby the feeler device may vibrate in harmony with the lay, and its amplitude of vibration be under control of the filling or weft in the shuttle; mechanism for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism; a moving part of the loom adapted

to engage and actuate the said controlling mechanism; a cam for placing said mechanism in inoperative position, and means under control of the said feeler device for engaging to retain in inoperative position said mechanism, whereby it may prevent the engagement of said moving part of the loom with said controlling mechanism to actuate it, until the failure or substantial exhaustion of the weft or filling in the shuttle, and then permit such engagement.

4. In a loom the combination with a feeler device vibrating in harmony with the lay, and under control of the weft or filling in the shuttle, a movable arm or member for bringing about or controlling the operation of a loom-stop or filling-renewing apparatus, a power-actuated hunter, a reciprocating part carried on said movable arm or member adapted to be engaged by said hunter, whereby the movable arm or member is actuated, means to periodically reciprocate said reciprocating part to remove it from the action of said hunter, or into inoperative position, a catch device adapted to engage said reciprocating part to hold it in such inoperative position, while the said hunter passes its critical position, and means intermediate of the said feeler device and said catch device whereby the latter is moved periodically into operative position to prevent actuation of the aforesaid movable arm or member until the failure or substantial exhaustion of the weft.

5. In a loom the combination with a feeler device vibrating in harmony with the lay, its amplitude of vibration under control of the weft or filling in the shuttle, a rock-shaft for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism, and mechanism for actuating said rock-shaft comprising an arm extending from the rock-shaft, a reciprocating part carried on said arm, a continuously-moving hunter for engaging said reciprocating part to actuate said rock-shaft, and mechanism under control of the said feeler device for removing the said reciprocating part from the path of said hunter when the shuttle is well supplied with weft or filling.

6. In a loom the combination with the lay and the shuttle box thereof of the feeler device D vibrating in harmony with the lay, and adapted to enter the shuttle in the shuttle-box A, whereby the amplitude of vibration of the feeler device is under control of the filling or weft in the shuttle; a cam E' operated by the feeler device to oscillate a lever F as long as sufficient quantity of weft or filling remains in the shuttle; said lever F; a rock-shaft G for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism, an arm as H, connected to said shaft, a movable slide I carried on said arm, a hunter J adapted to coact with said slide I to actuate arm H, a cam L carried by the lay for sliding said slide I and engaging hook devices *i f* carried by said slide and said lever F respectively, substantially for the purpose described.

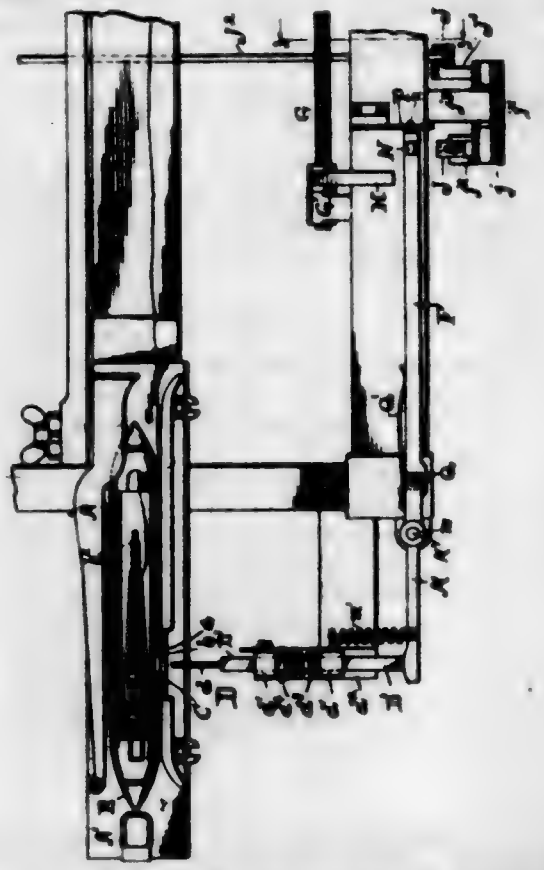
7. In a loom the combination with the lay of a movable arm or member for bringing about or controlling the operation of a weft-renewing or loom stop apparatus, a reciprocating part carried on said arm or member, a spring acting on said part to hold it in normal or operative position, means as a cam, for periodically moving said part against the action of said spring and an intermittently-actuated and weft-controlled device for engaging and holding said part in inoperative position, and a hunter for actuating said part when said weft-controlled device fails to engage the same, whereby a weft-renewing or loom-stop mechanism may be brought into operation upon failure or substantial exhaustion of the weft in the shuttle.

8. In a loom the combination with the lay of a device fitted to move to and fro in harmony with the lay provided with a member for entering the shuttle to coact with the weft therein, whereby the amplitude of movement of said to-and-fro device is controlled by the quantity of weft in the shuttle; a hunter, and mechanism actuated thereby adapted to control or bring about the operation of a loom-stopping or weft-renewing apparatus; means for intermittently moving said mechanism into inoperative position; and a lever device for intermittently maintaining said mechanism in such inoperative position; and means intermediate said lever device and said to-and-fro device for producing such intermittent movement of said lever device, until the amplitude of movement of said to-and-fro device reaches a predetermined point.

9. In a loom the combination with the lay of a feeler device adapted to move to and fro in harmony with the lay, its amplitude of movement under control of the weft in the shuttle; mechanism for bringing about or controlling the operation of a loom-stopping or filling-renewing apparatus, said mechanism including a shifting block; a moving part of the loom for engaging said block to actuate said mechanism; a second moving part of the loom for shifting said block out of the path of said first-named moving part; means for returning said block to normal position; a lever device adapted and fitted to be oscillated by said feeler device until the weft is exhausted to a predetermined extent, and means intermediate of said lever device and said shifting block whereby said lever device may intermittently retain said shifting block in its inoperative position, and thereby prevent the operation of the loom-stopping or filling-renewing mechanism until the predetermined exhaustion of weft.

10. In a loom the combination with the lay of the feeler device D for coacting with the weft in the shuttle in play, and operated to move to and fro in harmony with the vibrations of the lay, the oscillating lever device F, the cam E constituting means whereby the feeler device may oscillate the lever device when there is sufficient weft in the shuttle, the rock-shaft G adapted to be connected with loom-stopping, or weft-renewing apparatus, the arm H carried thereon, the shifting block I fitted to said arm to actuate shaft G, the oscillating cam L for shifting said block I to inoperative position, and a hook *f* carried on said lever device F, adapted to retain said block I in inoperative position while the hunter J is actuated.

709,911. **MECHANISM FOR CONTROLLING LOOMS BY THE QUANTITY OF WEFT IN THE SHUTTLES.** JOHANN H. KLEIN, Sunbury, Pa., assignor to Susquehanna Silk Mills, Sunbury, Pa., a Corporation of Pennsylvania. Filed Dec. 10, 1901. Serial No. 85,230. (No model.)



Claim.—1. In a loom the combination with the lay of a lever device fitted to oscillate, means under control of the filling or weft in the shuttle in play, for effecting oscillations of said lever device in harmony with the vibrations of the lay, whereby such oscillations will be diminished in extent or amplitude in accordance with the quantity of weft or filling in the shuttle, a member for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism, a hunter for actuating said member, through the medium of said lever device, and means connected with said lever device for controlling the actuation of said member, whereby on the failure or substantial exhaustion of the weft in the shuttle in play, the operation of the loom-stop or filling-renewing mechanism may be effected.

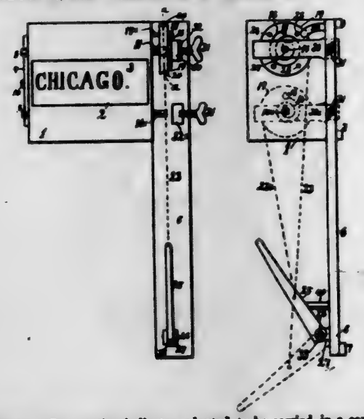
2. In a loom the combination with the lay of a lever device fitted to oscillate in harmony with the vibrations of the lay, means coacting with the weft or filling in the shuttle in play for effecting oscillations in said lever device in accordance with the quantity of weft or filling in the shuttle, a pivot contained in said lever to permit part thereof to be intermittently displaced independently of the main portion, a hunter adapted to effect such intermittent displacement, a member for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism, said member adapted to be actuated by said lever device when the latter is displaced by the said hunter, and means controlled by the oscillation of said lever device to prevent its engagement with either the hunter or with the said controlling member until the failure or substantial exhaustion of the weft or filling, and for then permitting such engagement.

3. In a loom the combination with the lay of a shuttle-box, a movable feeler device, constructed and fitted to enter the shuttle in the shuttle-box when the lay beats up, whereby the movement of the feeler device is under control of the weft or filling in the shuttle, a lever device operatively connected with said feeler device so as to oscillate in harmony with the vibration of the lay under control of the weft or filling in the shuttle, a member for bringing about or controlling the operation of a loom-stop or filling-renewing mechanism, and operative means including

said lever device, intermediate of said member and a moving part of the loom, said means being under control of the said lever device, whereby a loom-stop or filling-renewing mechanism may be operated upon failure or substantial exhaustion of the weft or filling.

4. In a loom the combination with the lay, of the shuttle-box carried on the lay, of a feeler device D constructed to enter the shuttle in the shuttle-box to coact with the weft or filling and fitted to move to and fro in harmony with the vibrations of the lay, whereby the extent or amplitude of movement of the feeler device will depend upon the quantity of weft or filling in the shuttle in play, a lever device M F actuated by and in unison with said feeler device, a hunter J, a block N carried on said lever device adapted to be engaged by said hunter, a lever H connected with a controlling-shaft and adapted to be actuated upon the engagement of said hunter and block N, and a stationary cam H adapted to effect the removal periodically of said block from the path of the hunter until with the consumption of weft or filling the oscillations of the lever device are diminished in extent to a predetermined point, whereby until such time the engagement of said hunter and block is avoided.

709,912. STATION-INDICATOR. ADAM KEMPF, Colby, Wis. Filed Feb. 20, 1902. Serial No. 95,002. (No model.)



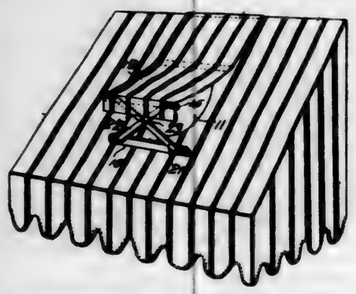
Claim.—In a station-indicator adapted to be carried in a car, and suitably framed, the combination with a box having an aperture in its front side of two rollers journaled in the box, a slip of flexible material secured with one end on each roller and having the names of stations or streets marked upon the side adjacent to the aperture in the front of the box, a friction spring-bar pressing upon one journal of each roller; each roller having a square end portion, a ratchet-wheel having a square central hole adapted to fit upon either of said journals with either side of the wheel toward the roller, a pulley surrounding the ratchet-wheel and revolving on the hube of it, a spring-pressed pawl pivoted in the pulley and engaging the ratchet-wheel, the pins 18 and 18× projecting from both sides of the pulley, the spiral spring 16 having a loop at its outer end adapted to go on the pins 18 and 18×, the central stem 15 secured to the inner end of the spring and having square ends, the post 20 having a square hole adapted to fit the square ends of the spring-stem, two set-screwed pockets in the framework for holding the post 20 near either of the roller-journals, the chain or cord 23 secured to the pulley, and hand-lever 26 pivoted on an extension of the framework and connected to said cord or chain, and means for limiting the motion of the lever, substantially as and for the purpose set forth.

709,918. AWNING. BENJAMIN F. LAMB and ELIJAH G. GOULD, Portland, Me. Filed May 14, 1902. Serial No. 107,309. (No model.)

Claim.—1. An awning having an aperture, a flap covering said aperture, and means connecting the free edge of said flap with the body of the awning, said means serving to permit the upward movement of the free edge of said flap and to limit the movement of the same in an upward direction.

2. The combination with an awning having an aperture therethrough, of a flap covering said aperture, a bar secured near the free edge of said flap, a corresponding bar secured to the body of the awning, and connecting means, so connecting the said bars as to permit them to separate when the flap is raised by the impact of the wind and to lie closely together upon the cessation of such pressure.

3. An awning having an aperture, a flap covering said aperture and connected by one edge to the awning, oppositely-disposed bars connected respectively to the outer edge of said flap and to said awning, and crossed, pivotally-connected bars connected movably to said oppositely-disposed bars.



4. An awning having an aperture, a flap covering said aperture and connected at one edge to the awning, oppositely-disposed bars connected respectively to the free edge of said flap and to said awning, said bars having longitudinal slots, and reversedly-disposed diagonal bars connected movably to said slots.

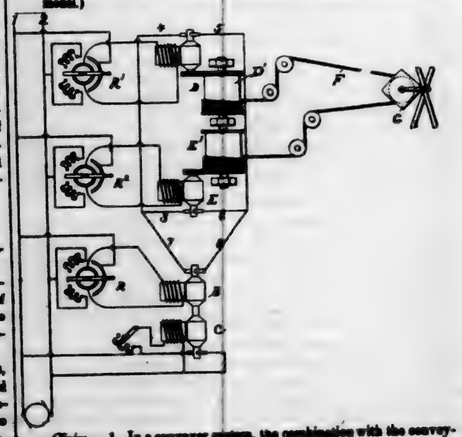
709,914. MOORING BLOCK OR CLUMP. GEORGE C. L. LEMON, London, England. Filed June 30, 1902. Serial No. 113,237. (No model.)

Claim.—1. The combination with a wedge-shaped mooring block or clump provided with a narrow vertical slot at the front of a shank passing through the slot having a limited vertical movement therein and pivoted at the rear of it.

2. The combination with a hollow wedge-shaped mooring block or clump consisting of a back plate a slotted front plate inclining backward and upward and two side plates of a shank passing through the slot and pivoted to the back plate.

3. The combination with a hollow wedge-shaped mooring block or clump consisting of a back plate a slotted front plate narrower than the back plate and inclining backward and upward and two side plates inclining inward and upward of a shank passing through the slot and pivoted to the back plate.

709,915. CONTROL OF ELECTRIC MOTORS. HARRY W. LEONARD, Bronxville, N. Y. Filed Aug. 26, 1901. Serial No. 73,242. (No model.)



Claim.—1. In a conveyer system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, one of said machines operating as a motor to drive the apparatus, and the other machine operating as a generator or driven by said apparatus.

2. In a conveying system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, and a main source of electric energy to which said machines are connected, one of said machines operating as a motor through energy received from said source to drive the apparatus, and the other machine operating as a generator driven by said apparatus and supplying energy to the motor.

3. In a conveyer system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, said machines being connected in series in a closed loop, and a main source to which said loop is connected, one of said machines operating as a motor to drive the apparatus, and the other machine operating as a generator driven by said apparatus, and said motor receiving energy from the source and said generator.

4. In a conveyer system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, one of said machines operating as a motor to drive the apparatus, and the other machine operating as a generator driven by said apparatus, and means for controlling the direction of movement of said conveying apparatus.

5. In a conveyer system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, one of said machines operating as a motor to drive the apparatus and the other machine operating as a generator driven by said apparatus, and means for controlling the direction of rotation of said machines.

6. In a conveyer system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, one of said machines operating as a motor to drive the apparatus, and the other machine operating as a generator driven by said apparatus, and means for controlling the speed of rotation of said machines.

7. In a conveyer system, the combination with the conveying apparatus, of two dynamo-electric machines for operating said apparatus, one of said machines operating as a motor to drive the apparatus, and the other machine operating as a generator driven by said apparatus, and means for simultaneously controlling the speed and direction of rotation of said machines.

8. The combination with a source of electric energy, of three dynamo-electric machines B, D and E, having their field-windings connected with said source, and the armatures of machines D and E being connected in multiple-arc relation across the armature-terminals of machine B, the latter machine and one of said machines D and E generating electric energy and the other machine absorbing electric energy.

9. The combination with a main source of electric energy, of a dynamo-electric machine B, having its field-winding connected with said main source and its armature driven by energy received from said source, and two dynamo-electric machines D and E having their field-windings connected with said source, and their armatures connected in multiple-arc relation across the armature-terminals of machine B, the latter machine and one of said machines D and E generating electric energy and the other machine absorbing electric energy.

10. The combination with a main source of electric energy, of a dynamo-electric machine B, having its field-winding connected with said main source and its armature driven by energy received from said source, and two dynamo-electric machines D and E having their field-windings separately excited from said source, and their armatures connected in multiple-arc relation across the armature-terminals of machine B, the latter machine and one of said machines D and E generating electric energy and the other machine absorbing electric energy.

11. The combination of a source of electromotive force, two dynamo-electric machines whose armatures are in multiple arc across said source, means for varying the electromotive force of said source to vary the speed of the said armatures, the field-windings of said dynamo-electric machines being connected across an independent electromotive force, and means for inductively varying the relative speeds of the two armatures.

12. The combination of a dynamo-electric machine having a separately-excited field-winding and two other dynamo-electric machines whose armatures are connected in multiple-arc relation across the armature-terminals of the first named dynamo, and both of said machines having separately-excited field-windings.

13. The combination of a local circuit, two dynamo-electric machines whose armatures are connected in said circuit, a cable or equivalent device mechanically connecting the two armatures and means whereby the current in the local circuit can be varied for the purpose of varying the tension of the cable.

14. The combination of a local circuit, two dynamo-electric machines whose armatures are connected in said circuit, a cable or equivalent device mechanically connecting the two armatures, and means for varying the electromotive forces supplied to the two armatures for the purpose of varying the speed of the cable.

15. In a conveyer system connected between moving objects, the combination of a conveying-cable or equivalent device, means for driving said cable, and electrical means for varying or controlling the tension of said cable.

16. In a conveyer system connected between moving objects, the combination of a conveying-cable or equivalent device, means for driving said cable, and apparatus for generating electric energy for controlling the tension of said cable.

17. In a conveyer system connected between moving objects, the combination of a conveying-cable or equivalent device, an electric motor for driving said cable, and electrical means for varying or controlling the speed of said cable.

18. In a conveyer system connected between moving objects, the combination of a conveying-cable or equivalent device, an electric motor for driving said cable, and electrical means for varying or controlling the direction of movement of said cable.

19. The combination of two dynamo-electric machines whose armatures are electrically connected together, a cable or equivalent device mechanically connecting the two armatures and electric means whereby the tension of the cable can be varied at the will of the operator.

20. The combination of two dynamo-electric machines whose armatures are electrically connected together, a cable or equivalent device mechanically connecting the two armatures, and means whereby the relative speeds of the two armatures can be varied at the will of the operator.

21. The combination of two dynamo-electric machines whose armatures are electrically connected together, each armature being geared to a drum, a cable mechanically connecting the two drums, and means for controlling the speed of at least one of the dynamo-electric machines.

22. In an apparatus for coiling at sea, the combination of a moving cable and electric means for controlling the tension of the cable by the generation of electric energy.

23. In an apparatus for conveying materials to or from a vessel which is free to move upon the water, the combination of a cable connecting the vessel with another object above the surface of the intervening water, and electric means for controlling the tension of said cables so as to maintain the cable clear of the water under conditions of relative movement of the vessel and the other object.

24. In an apparatus for conveying materials to or from a vessel which is free to move upon the surface of the water, the combination of a cable, chain, or equivalent device connecting the vessel with another object, a dynamo-electric machine whose armature is mechanically connected with said cable, chain, or equivalent device, and means for controlling the current in said armature whereby the tension of said cable can be controlled.

25. In an apparatus for conveying materials to or from a vessel which is free to move upon the surface of the water, the combination of a cable, chain, or equivalent device connecting the vessel with another object, a dynamo-electric machine whose armature is mechanically connected with said cable, chain, or equivalent device, and electric means for keeping the tension upon the cable sufficiently constant to keep the cable clear of the water when the distance between the vessel and the other object is reduced.

26. In an apparatus for conveying materials to or from a vessel which is free to move upon the surface of the water, the combination of a cable, chain, or equivalent device connecting the vessel with another object, a dynamo-electric machine whose armature is mechanically connected with said cable, chain, or equivalent device, and means for controlling the tension upon said cable when there is a movement of the vessel relative to the other object, by controlling the torque of the armature of said dynamo-electric machine.

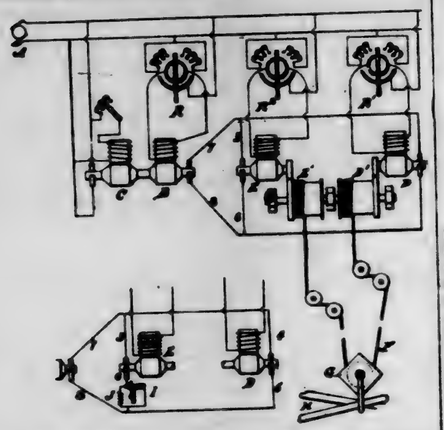
27. In an apparatus for conveying materials to or from a vessel which is free to move upon the surface of the water, the combination of a cable, chain or equivalent device connecting the vessel with another object, a dynamo-electric machine whose armature is mechanically connected with said cable, chain, or equivalent device, and means for controlling the tension upon said cable when there is a movement of the vessel relative to the other object by controlling the current in one of the elements of said dynamo-electric machine.

709,916. METHOD OF CONTROLLING ELECTRIC MOTORS. HARRY W. LEONARD, Bronxville, N. Y. Original application filed Aug. 26, 1901, Serial No. 73,242. Divided and this application filed Dec. 10, 1901. Serial No. 85,260. (No model.)

Claim.—1. The method of varying the tension of a moving cable, consisting in causing said cable to drive a generator of electric energy and varying the energy so produced.

2. The method of controlling the tension upon a cable or equivalent

device connecting two objects, consisting in mechanically connecting the cable with the revolving element of a dynamo-electric machine and varying the current in one element of said dynamo-electric machine whereby the tension upon said cable is controlled.

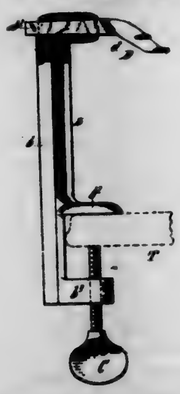


2. The method of controlling the tension upon a moving cable or equivalent device connecting two objects, which consists in running the moving cable to generate electric energy and controlling the amount of electric energy generated.

4. The method of controlling the tension upon a cableway between two ships at sea, which consists in winding up one end of the cable by means of an electric motor, driving by means of the other end of the cable an electric generator, and controlling the output of said generator.

5. The method of operating a cableway between two ships at sea, which consists in stretching between the ships a cable, the two ends of which are upon one ship and the bight of which is upon the other ship, winding up one end of the cable by means of an electric motor, driving an electric generator by means of the other end of the cable in order to produce motion of the conveying cable in one direction, and reversing the direction of motion of the cable by reversing the necessary elements of said dynamo-electric machine.

709,917. **SEINE-RIPPER.** FRANK I. MARSHALL, Boston, Mass. Filed Oct. 28, 1901. Serial No. 79,621. (No model.)



Claim.—1. A stitch-ripper, comprising a cutter, having one or more cutting edges and one or more blunt points, and a holder.

2. A stitch-ripper, comprising a cutter having a curved blade, the outer edge of which is sharpened, terminating in a blunt guide and a holder, substantially as described.

3. A stitch-ripper, comprising a cutter A, having the blade a with one cutting edge and the guide a' and the holder B, all substantially as described.

709,918. **FRICTION-CLUTCH.** ANTON HILL, Cincinnati, Ohio, assignor to the American Tool Works Company, Cincinnati, Ohio, a Corporation of West Virginia. Filed Dec. 5, 1901. Serial No. 84,944. (No model.)

Claim.—1. The combination of a revolvable agency, a pair of oppositely-arranged concentric friction-faces facing each other, and oppositely-arranged friction-ring members, with a rock-pin having wings thereon engaging said friction-ring members and rocking about an axis located between said friction-ring members, and means for rocking said pin thereby causing one of the friction-ring members to be pressed longitudinally and inwardly and the other to be pressed longitudinally and outwardly into frictional engagement with said faces.

2. The combination of a plurality of friction-faces concentric with the axis of a revolving agency one of which faces outwardly from and the other inwardly toward said axis and toward each other, with expanding and contracting ring members for said faces, a rock-key having wings integral therewith and rocking therewith about a common axis located between said members and means for rocking said key thereby causing engagement of said ring members with said faces by having said wings press said rings respectively longitudinally and inwardly and longitudinally and outwardly by pressure upon the ends of the same, substantially as described.

3. The combination of a revolvable agency, a pair of friction-surfaces facing respectively inwardly and outwardly with relation to the axis of the revolvable agency and toward each other's planes, a pair of friction-rings, one expansibly and the other contractibly arranged for engagement with said friction-surfaces, a shoulder for a ring, an engaging face on the other ring, a rock-key and wings thereon having a common axis located between the planes of said friction-rings for engagement with said shoulder and the engaging face of the other ring and means for rocking said key thereby simultaneously causing frictional engagement between the friction-rings and said pair of friction-surfaces.

4. The combination of a revolvable agency, a pair of friction-surfaces concentric therewith and facing each other, a pair of friction-ring members between the same, a shaft, a flanged collar, means for securing the ring members to the flanged collar, a shoulder for a ring member, a rock-shaft having wings integral therewith between said shoulder and the other ring member, and a rocker-arm secured to said rock-shaft and by its movement causing said wings to move concentrically about the axis of the said rock-shaft between the planes of said ring members and thereby engaging said shoulder and the other ring member and means for rocking said rocker-arm thereby simultaneously causing said members to engage said concentric friction-surfaces.

5. In a friction-clutch, the combination with a shaft, of a revolvable agency surrounding the shaft and having a pair of friction-surfaces facing respectively inwardly and outwardly with relation to the axis of the revolvable agency and toward each other's planes, a pair of split friction-rings, one expansibly and the other contractibly arranged for engagement with said friction-surfaces, a contact-face for each ring and a rock-key having a pair of wings arranged to engage said contact-faces and having their axis extending longitudinally of the shaft between the planes of said friction-rings and arranged to turn on that axis and means for rocking said key.

6. In a friction-clutch, the combination of the hub E, the friction-faces e' e^2, the split friction-rings G G', the collar D, the key I having wings i' i^2, the journal i for the key, the bearing d^2 on the collar D in which the journal i rocks, with the engaging faces g' g^2 on the said friction-rings for engagement by said wings and means for rocking said key, substantially as described.

7. In a friction-clutch, the combination with a shaft, of a collar D therefor, a hub E surrounding the shaft, with an annular groove for the hub having therein the friction-faces e' e^2 facing each other, the friction-rings G G' between said faces, the rock-key I having wings i' i^2 and journal i rocking about a common axis extending longitudinally of the shaft between said friction-rings and rocking on that axis for simultaneously expanding and contracting said friction-rings for simultaneously respectively increasing and decreasing their diameter uniformly and causing uniform engagement between said rings and said friction-faces throughout

their length, with a cone on the shaft, and a rock-arm K for the key for rocking the latter, substantially as described.

8. In a friction-clutch, the combination of two concentric friction-faces facing each other, and a pair of concentric friction-rings between the same, a rock-pin having engaging faces for the pair of friction-rings, the axis of said rock-pin being between said friction-rings and with the rock-pin and said engaging faces rocking about said axis of said rock-pin eccentrically and thereby force the friction-rings into engagement with said friction-faces, and means for rocking the rock-pin.

709,919. **PAIL-HOOK.** CHARLES W. MITCHELL, Brooklyn, N. Y., assignor to Twisted Wire Box Strap Company of New York, a Corporation of New York. Filed June 15, 1902. Serial No. 112,171. (No model.)

Claim.—1. As article of manufacture consisting of a metal strap of convenient shape, the end portions thereof being flat and folded each on itself and provided with corners bent outwardly to form approximately perpendicular barbs, substantially as described.

2. As an article of manufacture, a strap, pointed end portions thereon folded each on itself, each end portion being provided with a barb on each folded edge, substantially as described.

3. As an article of manufacture, a metal strip, the end portions of the same being folded longitudinally and disposed at an angle to said strip to form fastening-points, and oppositely-projecting barbs formed on the adjacent edges of said folded portions, substantially as described.

4. As an article of manufacture, a pail-hook consisting of a strap, pointed end portions thereon each folded longitudinally on itself and bent over into contact with said strap to form a relatively heavy base for the folded portion, and opposite and outwardly-bent barbs on the adjacent folded edges, substantially as described.

5. As an article of manufacture, a pail-hook consisting of a strap, pointed end portions thereon, folded to form fastening-points of double thickness, the said folded portion being bent over into close contact with the body of the strap to form a flat and relatively heavy base portion and oppositely-projecting barbs on said folded portions and approximately perpendicular thereto, substantially as described.

6. As an article of manufacture, an oblong piece of metal, the end portions of the same being disposed at an angle to the body of the piece and folded longitudinally to form fastening-points of double thickness, corners on the adjacent edges of said folded portions formed by removing therefrom a part of the metal and bent outwardly to constitute barbs for the fastening-points, substantially as described.

709,920. **FEEDER FOR CIGARETTE-MACHINES.** TRAHOUT MONTGOMERY, Brooklyn, N. Y. Filed Mar. 21, 1900. Renewed Mar. 6, 1902. Serial No. 96,970. (No model.)

Claim.—1. In a tobacco-feeder, the combination of an endless conveying-belt and means for feeding particles of tobacco thereto upon a line at an angle to the delivery end of the belt, substantially as set forth.

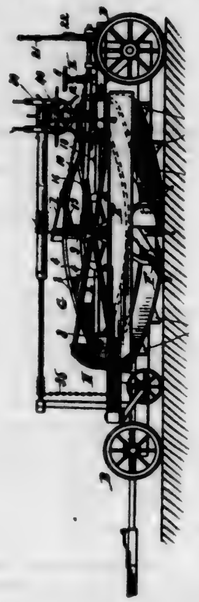
2. The combination in a tobacco-feeder, of an endless traveling belt, means for feeding tobacco thereto, at an angle to the delivery end of the belt, and a picker-roll arranged opposite said end, substantially as set forth.

3. The combination in a tobacco-feeder, of an endless traveling belt, means for feeding tobacco thereto, at an angle to the delivery end of the belt, a picker-roll arranged opposite said end, and a chute arranged below the delivery end of the belt and provided with a curved mouth, substantially as described.

4. The combination in a tobacco-feeding machine, of an endless traveling delivery-belt, and a feed-belt arranged above the delivery-belt at an angle thereto, and an intermediate chute, substantially as described.

5. The combination of a delivery-belt and a feed-belt at an angle thereto, and a picker-roll opposite the end of the feed-belt, substantially as set forth.

709,921. **GRADING AND EXCAVATING MACHINE.** WILLIAM H. HOSKINS, Lakeview, Iowa, assignor to Frederick C Austin, Chicago, Ill. Filed Jan. 26, 1901. Serial No. 44,793. (No model.)



Claim.—1. In a grading and excavating machine, a rotary elevating conveyer-wheel supported to run upon the ground in an inclined position and adapted to receive the soil from a plow and carry such soil up to the point of discharge; a combined scraper and deflector arranged to scrape and deflect the soil from the wheel and supported to swing about the axis of said wheel; and a device for operating the combined scraper and deflector arranged and adapted to be actuated at will by an attendant upon the machine.

2. A grading and excavating machine comprising a rotary elevating conveyer-wheel supported to run upon the ground in an inclined position and having a soil-carrying portion adapted to receive the soil from a plow and carry such soil up to the point of discharge; and a combined scraper and deflector adapted to deflect the soil from the soil-carrying portion of the elevating conveyer-wheel and, having a swinging adjustment about the axis of the elevating conveyer-wheel, and also away from and toward the plane of the soil-carrying portion of such wheel.

3. A grading and excavating machine comprising a rotary elevating conveyer-wheel supported to run upon the ground in an inclined position and having a soil-carrying portion adapted to receive the soil from a plow and carry such soil up to the point of discharge; a combined scraper and deflector arranged to deflect the soil from the soil-carrying portion of the elevating conveyer-wheel and supported to swing about the axis of such wheel; a chain or equivalent flexible connection between the combined scraper and deflector; and an operating device provided for varying the length of flexible connection between such operating device and the combined scraper and deflector, and thereby shift the point of discharge by an adjustment of the combined scraper and deflector.

4. A grading and excavating machine comprising a rotary elevating conveyer-wheel supported to run upon the ground in an inclined position and having a soil-carrying portion adapted to receive the soil from a plow and carry such soil up to the point of discharge; a combined scraper and deflector adapted to deflect the soil from the soil-carrying portion of the elevating conveyer-wheel and supported to swing about the axis of such wheel and to swing away from and toward the soil-carrying portion of the latter; a rotary shaft applied for swinging the combined scraper and deflector toward and away from the plane of the soil-carrying portion of the elevating conveyer-wheel and adapted for automatic longitudinal extension and contraction with reference to the swing of the combined scraper and deflector about the axis of the elevating conveyer-wheel; and a suitable operating device for actuating the rotary shaft.

5. A grading and excavating machine comprising a rotary conveyer

wheel which runs upon the ground in an inclined position to receive the soil from the plow and carry such soil up to the point of discharge; a tilting bearing centrally supporting the elevating conveyor-wheel and hinged to a tilting support which is in turn carried by the body-frame of the machine; means for tilting the elevating conveyor-wheel and its central supporting-bearing independently of the tilting support on the body-frame; and means for raising and lowering the tilting support on the body-frame so as to bodily raise or lower the elevating conveyor-wheel.

6. A grading and excavating machine comprising a wheeled body-frame; a plow; a rotary elevating conveyor-wheel which runs upon the ground in an inclined position to receive the soil from the plow and carry such soil up to the point of discharge; a tilting bearing centrally supporting the elevating conveyor-wheel and hinged to a tilting support which is carried by the body-frame of the machine; means for tilting the elevating conveyor-wheel and its central supporting-bearing; a lever fulcrumed upon the body-frame of the machine and applied for adjusting said tilting support which is carried by the body-frame; and an adjusting device for operating said lever.

7. A grading and excavating machine comprising a wheeled body-frame; a plow; a tilting conveyor-wheel which runs upon the ground in an inclined position to receive the soil from the plow and carry such soil up to the point of discharge; a rotary winding-drum or hollow shaft; a chain or cable applied whereby the elevating conveyor-wheel can be tilted by operating the winding-drum or hollow shaft; and a plow raising and lowering mechanism involving a rotary shaft which extends through the said winding drum or shaft.

709,922. PROCESS OF MAKING CELLULOSE ESTERS. HARRY S. HEDE, Boston, ARTHUR D. LITTLE, Brookline, and WILLIAM H. WALKER, Newton, Mass., assignors, by mesne assignments, to Chemical Products Company, Boston, Mass., a Corporation of Maine. Filed Jan. 17, 1902. Serial No. 89,397. (No specimens.)

Claim.—1. The process of making cellulose esters, which consists in treating cellulose with an acid anhydrid in the presence of an aromatic sulfonic acid.

2. The process of making cellulose esters of fatty acids, which consists in treating cellulose with a fatty-acid anhydrid in the presence of an aromatic sulfonic acid.

3. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid in the presence of an aromatic sulfonic acid.

4. The process of making cellulose esters, which consists in treating cellulose with an acid anhydrid in the presence of a sulfonic acid.

5. The process of making cellulose esters of the fatty acids, which consists in treating cellulose with a fatty-acid anhydrid in the presence of a sulfonic acid.

6. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid in the presence of a sulfonic acid.

7. The process of making cellulose esters, which consists in treating cellulose with an acid anhydrid in the presence of an aromatic sulfonic acid, together with a salt of said acid.

8. The process of making cellulose esters of the fatty acids, which consists in treating cellulose with a fatty-acid anhydrid in the presence of an aromatic sulfonic acid, together with a salt of said acid.

9. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid in the presence of an aromatic sulfonic acid, together with a salt of said acid.

10. The process of making cellulose esters, which consists in treating cellulose with an acid anhydrid in the presence of a sulfonic acid, together with a salt of said acid.

11. The process of making cellulose esters of the fatty acids, which consists in treating cellulose with a fatty-acid anhydrid in the presence of a sulfonic acid, together with a salt of said acid.

12. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid in the presence of a sulfonic acid, together with a salt of said acid.

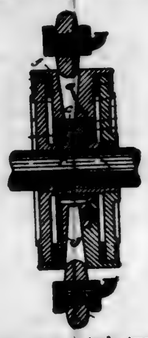
13. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid, acetic acid, and phenol-sulfonic acid, substantially as described.

14. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid, acetic acid, phenol-sulfonic acid, and a salt of phenol-sulfonic acid in the proportion and under the conditions, substantially as described.

15. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid and naphthol-sulfonic acid.

16. The process of making cellulose acetate, which consists in treating cellulose with acetic anhydrid, naphthol-sulfonic acid, and a salt of naphthol-sulfonic acid.

709,923. MOMENTUM CAR-BRAKE. THOMAS R. MCCOLLAM, Toronto, Canada. Filed Jan. 2, 1902. Serial No. 88,294. (No model.)



Claim.—1. In a momentum car-brake, two friction-disks fast on the axle, in combination with two friction-disks loose on the axle between the fixed disks; means whereby the loose disks are held so that they are free to move longitudinally with respect to one another but are held from rotating independently; means for winding a chain carried by one of the loose disks; and means for spreading the loose disks into contact with the fixed disks, substantially as described.

2. In a momentum car-brake, two friction-disks fast on the axle, in combination with two friction-disks loose on the axle between the fixed disks; means whereby the loose disks are held so that they are free to move longitudinally with respect to one another but are held from rotating independently; means for winding a chain by the rotation of the loose disks; one or more wedge-wheels; and means for forcing the said wedge-wheels between the loose friction-disks, substantially as described.

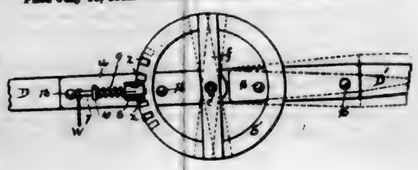
3. In a momentum car-brake, a sleeve fast on the axle; a friction-disk fast on the sleeve at one end; and a friction-disk detachably secured to the other end of the sleeve, in combination with two disks loose on the sleeve between the fixed disks; means whereby the loose disks are held so that they are free to move longitudinally with respect to one another but are held from rotating independently; means for winding a chain carried by one of the loose disks; and means for spreading the loose disks into contact with the fixed disks, substantially as described.

4. In a momentum car-brake, a sleeve fast on the axle; a friction-disk fast on the sleeve at one end; and a friction-disk detachably secured to the other end of the sleeve, in combination with two disks loose on the sleeve between the fixed disks; means whereby the loose disks are held so that they are free to move longitudinally with respect to one another but are held from rotating independently; means for winding a chain carried by one of the loose disks; one or more wedge-wheels; and means for forcing the said wedge-wheels between the loose friction-disks, substantially as described.

5. In a momentum car-brake, two friction-disks fast on the axle, in combination with two friction-disks loose on the axle between the fixed disks; means whereby the loose disks are held so that they are free to move longitudinally with respect to one another but are held from rotating independently; means for winding a chain carried by one of the loose disks; means for spreading the loose disks into contact with the fixed disks; and spring mechanism normally tending to draw the loose disks together, substantially as described.

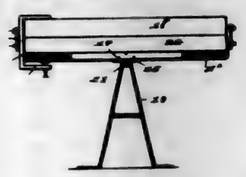
6. In a momentum car-brake, two friction-disks fast on the axle, in combination with a friction-disk loose on the axle between the fixed disks; a flanged hub formed on the said disk; a second disk loose on the axle and recessed to receive the flange on the said hub; one or more pins secured to one of the loose disks and loose in holes in the other; and means for spreading the loose disks into contact with the fixed disks, substantially as described.

709,924. JOINTED POLE. MARTIN HEDGE, Emerson, Iowa. Filed July 16, 1902. Serial No. 115,207. (No model.)



Claim.—In a joint for poles, the combination with a male member provided with a projecting perforated ear and secured upon one side with an annulus provided with a cross-bar centrally perforated, said perforation coming within alinement with the perforation within aforesaid ear, a female member provided with a perforated socket adapted to receive aforesaid perforated ear, and having a projecting annulus provided with a transverse bar perforated, said perforations coming in alinement within the perforations within said first-mentioned member, the annulus secured to said male member being notched, and a latch secured to said female member adapted to engage within the notches of the annulus secured to said male member, as and for the purpose set forth.

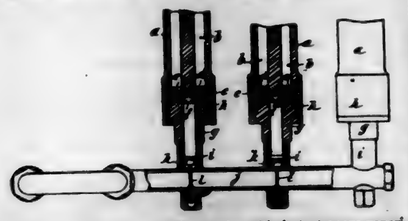
709,925. TILTING-FLASK SUPPORT. CHARLES PHELPS, Ostrander, Iowa. Filed June 28, 1901. Serial No. 66,466. (No model.)



Claim.—1. In a device of the class described, the combination of two flask-sections, means for holding the sections against lateral movement relative to each other, each section comprising side and end pieces and a cross-piece near each end having a notch or recess therein, an open-ended tube resting in said notches with its ends projected beyond the cross-pieces, the end portions of the flask-sections being designed to receive and to surround the ends of the tubes and in which to form mold-cavities, said cross-pieces being provided with openings through which the metal may be poured into the mold-cavities, for the purposes stated.

2. In a device of the class described, the combination of two flask-sections, means for holding the sections against lateral movement relative to each other, each section comprising side and end pieces, and a cross-piece near each end, an open-ended tube having its central portion between the cross-pieces and its ends projecting beyond the cross-pieces, the end portions of the flask-sections being designed to receive and to surround the ends of the tube and in which to form mold-cavities, and cores in the ends of the tubes to enter the mold-cavities.

709,926. STEAM-GENERATOR. EDOARD DE POZZO-RIZZI, Paris, France. Filed Feb. 19, 1901. Serial No. 47,942. (No model.)

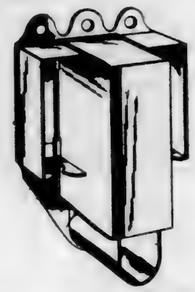


Claim.—1. A steam-generating device with instantaneous vaporization wherein each element is composed essentially of longitudinal passages, entirely independent of each other, embedded in the body of a metal bar and provided each one separately with feed-water.

2. A steam-generating device with instantaneous vaporization wherein each element is composed essentially of longitudinal passages, entirely independent of each other, embedded in the body of a metal bar and adapted each one separately to receive feed-water, which feed-water is supplied by means of small conduits discharging into the respective vaporizing-channels and emerging from a small basin, into which the water of the collector flows directly.

709,927. TOOTH-BRUSH AND POWDER CABINET. OSWYN T. PRICE, Washington, D. C., assignor to the Keds Company, a Corporation of West Virginia. Filed Jan. 28, 1902. Serial No. 91,577. (No model.)

Claim.—1. A tooth-brush and powder cabinet comprising a back made of a single piece of metal, having wings which are adapted to be bent to form brush-carrying racks and bearings therefor, a powder-box having a spring-actuated slide adapted to regulate the feed of powder from the box, flanges on the edges of said box which are adapted to be engaged by upset portions of said back, which holds the box to said back, as set forth.



2. A tooth-brush and powder cabinet comprising a back stamped from a single piece of metal and provided with winged portions which are adapted to be bent against the back to form racks to support tooth-brushes, a powder-box, having a spring-actuated slide mounted in said box and adapted to regulate the feed of powder issuing therefrom through its apertured bottom, flanges on the longitudinal edges of said box, and a partition-wall, having flanges along its longitudinal edges, said partition being adapted to be inserted in said box, with the flanges of the partition and box in contact with each other, upset portions or lugs on the back of the receptacle, adapted to be turned over the edges of said flanges which are in contact with each other, whereby box and partition are held securely to the back of the receptacle, as set forth.

3. A tooth-brush and powder cabinet comprising a back cut from a single blank of metal and having integral wings which are bent to form tooth-racks and bearings therefor, a powder-box having flanged edges which are recessed, a partition adapted to be inserted within said box, and provided with flanges, on its longitudinal edges, which are recessed, the flanges of said box and partition being designed to be held in contact, with the recesses in said flanges in registration, lugs or upset portions on the back of the receptacle, adapted to be turned over the two edges of the flanges, and the lower inwardly-bent ends of said wings adapted to enter said registering recesses in the flanges, and a spring-actuated slide mounted within the box and adapted to regulate the feed of powder issuing therefrom as set forth.

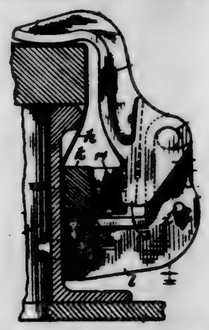
4. A tooth-brush and powder cabinet comprising in combination with a back made of a single piece of metal and having wings which are bent to form racks for tooth-brushes and bearings therefor, a powder-box having flanged edges which are recessed, an inclined portion adapted to be inserted within said box and having longitudinal flanges which are recessed and adapted to be held against the flanges of said box, with the recesses in said flange in registration, a flange at the lower end of said partition, which has an upset portion, a slide mounted and guided in the upset flange at the lower end of said inclined partition, a spring held at one end, to the back of the receptacle, and engaging a slot in the slide, lugs on the back of the receptacle which are adapted to engage over flanges on the back of partition, the lower inturned ends of said wings being adapted to engage registering recesses in said flanges, as set forth.

5. In a tooth-brush and powder receptacle having a back made of a single piece of metal and having wings which are adapted to be bent to form racks for supporting tooth-brushes, and bearings therefor, a spring held at one end in slits formed in said back, a powder-box made of a single piece of metal having flanges along its longitudinal edges, an inclined partition inserted within said box, registering notches in the flange of said box and partition, upset portions or lugs integral with the back, adapted to engage said flanges, the lower inturned ends of the wings of said back adapted to engage in said registering recesses, an apertured slide resting upon the bottom of the powder-box, and guided in the upset portion of the flange at the bottom of said inclined partition, the lower end of said spring passing through a slot in said slide, a U-shaped projection having flanges which are held to the under surface of bottom of the powder-box, substantially as shown and described.

709,928. HAT-FASTENER. ARMSBALD P. RANKIN, Lakewood, and ALBERT C. BURDICK, Cleveland, Ohio. Filed Nov. 28, 1901. Serial No. 84,048. (No model.)

Claim.—1. The combination, with a hat-brim surrounding frame or guard, the hat-brim resting upon said guard and having its turpentine or

flexible covering extending over and adown the outer side of the guard, brackets rigidly secured to the guard a suitable distance below the hatch and arranged externally of and at suitable intervals along the guard, and each bracket having an upwardly-projecting arm arranged a suitable distance laterally of and outside of the guard and provided with two slots or channels formed in opposite sides, respectively, of and extending up and down the arm and having upper rounded end walls and open at their lower ends, and a button resting upon the said bracket and arranged to hold the tarpaulin or covering against the outer side of the guard, of a bell-crank having journals arranged to engage the said end walls in the operative position of the bell-crank, which bell-crank has one of its arms provided with a jaw arranged to bear downwardly upon the hatch and has its other arm arranged to depend between the adjacent button and the button-facing surface of the bracket-arm, and a wedge between the said button and the button-facing surface of the depending bell-crank arm

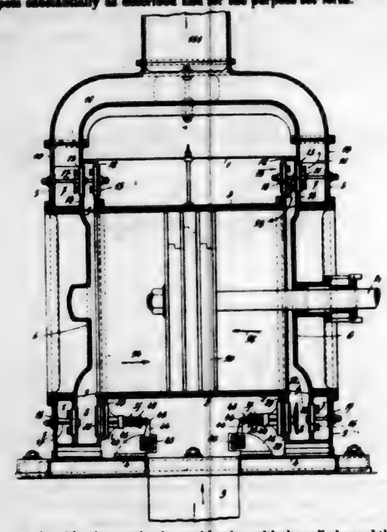


2. The combination, with a hatchway-surrounding frame or guard, the hatch resting upon the said guard and having its tarpaulin or flexible covering extending over and adown the outer side of the guard a suitable distance below the hatch and arranged externally of and at suitable intervals along the guard, and each of the said brackets having an upwardly-projecting arm arranged a suitable distance laterally of and outside of the guard and provided with two slots or channels formed in opposite sides, respectively, of and extending up and down the arm and having upper end walls and open at their lower ends, of a bell-crank having a jaw-bearing arm and a pressure-receiving arm, which bell-crank has two flanges or wings arranged at opposite sides, respectively, of the bracket-arm and journal-forming lugs formed upon the inner sides of the said wings or flanges and engaging the aforesaid channels, and means for exerting pressure against the pressure-receiving arm of the bell-crank, and the arrangement of parts being such that the jaw of the bell-crank shall bear downwardly upon the hatch upon rendering the pressure-applying means operative.

3. The combination with a hatchway-surrounding frame or guard, a hatch resting upon said guard, and having its tarpaulin or flexible covering extending over and down the outer side of the guard, brackets rigidly secured to the guard, a suitable distance below the hatch and arranged externally of and at suitable intervals along the guard each bracket having an upwardly-projecting arm arranged a suitable distance laterally of and outside of the guard and provided with two slots or channels formed in opposite sides, respectively, of and extending up and down the arm, and upper rounded end walls, and open at their lower ends, and a button resting upon the said bracket and arranged to hold the tarpaulin or covering against the outer side of the guard, of a bell-crank having journals arranged to engage the said end walls in the operative position of the bell-crank, which bell-crank has one of its arms provided with a jaw arranged to bear downwardly upon the hatch and has its other arm arranged to depend between the adjacent button and the button-facing surface of the bracket-arm, a pin arranged in the wall between the respective channel in the said bracket-arm, for locking the said bell-crank on the said bracket, and a wedge interposed between the depending arm of the bell-crank and the said button, substantially as described and for the purpose set forth.

709,929. BLOWING-ENGINE. ARSENE RAVEN, Jemappe, Belgium. Filed Mar. 13, 1901. Serial No. 50,752. (No model.)

Claim.—1. In a blowing-engine in combination with the cylinder and the piston, automatic inlet and outlet valves, supplementary automatic inlet-valves 28 at each end of the cylinder, levers 44 adapted to act upon the said supplementary valves, two shafts 45 carrying the said levers, a crank 47 at the end of each shaft, tappets 61 mounted on rocking levers 50 connected to said cranks, a shaft 53 rotating at a speed proportional or equal to the working speed of the engine, a sleeve 56 rotating with said shaft but adapted to be displaced longitudinally upon said shaft, cams 62 on said sleeve, adapted to engage the tappets 61, and an air-governor acting to regulate the value of the portion of the compression-stroke during which the cams 62 must be in engagement with the tappets substantially as described and for the purpose set forth.



2. In a blowing-engine in combination with the cylinder and the piston, automatic inlet and outlet valves, supplementary automatic inlet-valves 28 arranged on a straight line at each end of the cylinder, levers 44 adapted to act upon the said supplementary valves, two shafts 45 carrying the said levers, a crank 47 at the end of each shaft, tappets 61 mounted on rocking levers 50 connected to said cranks 47, balancing dashpots acting on the oscillating levers 50, a shaft 53 rotating at a speed proportional or equal to the working speed of the engine, a sleeve 56 rotating with said shaft but adapted to be displaced longitudinally upon said shaft 53, cams 62 on the sleeve 56, the said cams being adapted to engage the tappets 61, oscillating rods 57 connected at one end with the sleeve 56 and at the other end with the rod 64 of a piston 60 adjusting tightly in a cylinder 60, springs 61 acting upon said piston and a communication between the cylinder 60 and the outlet-pipe for the compressed air, substantially as described and for the purpose set forth.

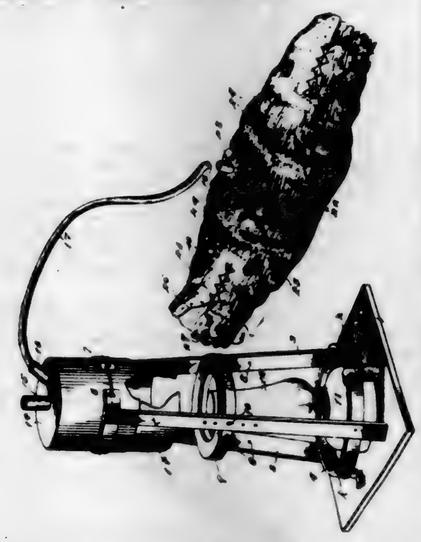
709,930. PNEUMATIC SADDLE-PAD. HENRY R. REHMAN, Chicago, Ill., assignor of one-half to Louis Kwiatkowski, Chicago, Ill. Filed Oct. 14, 1901. Serial No. 78,586. (No model.)

Claim.—A harness-pad comprising an upper and a lower cover-strip, a continuous inflatable tube secured between the cover-strip and extending entirely around the margin of the same and providing a seat for and conforming to the contour of the saddle used therewith, the portion of the cover-strips in the space bounded by the tube being secured together and lying between the top and bottom of the tube.

709,931. HOT-AIR APPARATUS FOR THE HUMAN BODY. GEORGE W. SAWYER, Marietta, Ind. Ter. Filed Oct. 18, 1901. Serial No. 79,177. (No model.)

Claim.—1. An apparatus of the class set forth comprising a base having straps attached thereto, a frame with a lower ring for engagement by said straps and an upper clamping-ring, and an interposition adjustable annular support.

2. A heating apparatus of the class described comprising a frame, a drum supported by the frame and having an open bottom, a conduit extending from the upper portion of the drum, removable pins extending through the walls of the drum at the lower portion thereof and projecting into the same to form an interiorly-arranged support, and a removable receptacle open at the top, arranged upon the inner portions of the pins, said pins being adapted to be withdrawn to permit the receptacle to be detached from the drum, substantially as described.



3. A heating apparatus of the class described comprising a frame having separable standards provided with perforations, an adjustable support provided with projections detachably engaging the said perforations, a clamp arranged at the top of the frame and connecting the standards and holding the projections in the perforations of the same, a drum engaged by the clamp, and a conduit extending from the drum, substantially as described.

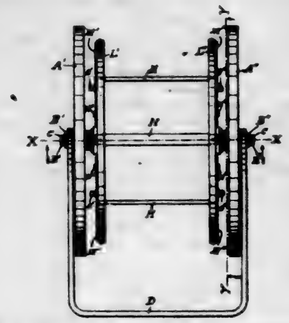
4. A heating apparatus of the class described comprising a frame composed of separable standards provided at intervals with perforations, a clamp connecting the upper portions of the standards, and a support provided with projections adapted to engage the perforations, whereby the support may be adjusted, a drum open at the bottom arranged within the clamp, removable supporting devices projecting into the drum, a receptacle located within the drum and removably arranged on the supporting devices and adapted to contain a liquid, and a conduit extending from the drum, substantially as described.

5. An apparatus of the class described comprising a frame, a drum open at the bottom supported by the frame, a removable receptacle arranged within the drum and open at the top, a heating device located beneath the receptacle, an inclosure of approximately cylindrical shape constructed of flexible material and adapted to receive a portion of the human body and provided at its ends with adjustable means for constricting it, whereby it is closed at those points on the body, said inclosure being also provided with an outlet, and a conduit extending from the drum and connected with the inclosure, substantially as described.

6. The combination of a base-plate having a heat-generator disposed thereon, a supporting-frame comprising uprights, a ring connected to the lower ends of said uprights, means connected with said base-plate for detachably engaging said ring, an adjustable annular support connected with said uprights, and means for detachably engaging a drum.

709,932. WIRE-REEL TRUCK. FRANK W. SUMMERLY, Dublin, Ind., assignor of one-half to Burt L. Hiatt, Dublin, Ind. Filed Dec. 26, 1901. Serial No. 87,282. (No model.)

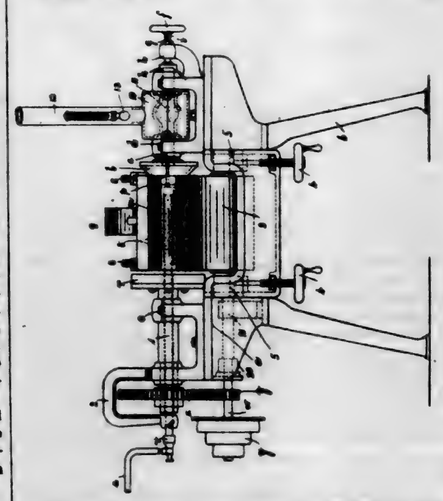
Claim.—1. In a wire-reel truck, the combination of a pair of wheels mounted on a common axle, each wheel being provided with a hub with an inward and an outward projecting flange, a wire-reel provided with hubs journaled on the inner flanges of the hubs of the wheels, removable guards to be attached to each side of the reel and secured thereto, a frame formed of one piece of material to provide a handhold and extending half-way around the truck with its ends journaled on the outer flanges of the hubs of the wheels, and keys passing through holes in each end of the axle, all substantially as shown and described and for the purposes set forth.



2. The reel formed of outwardly-projecting arms I' and I'' connected by the members H at right angles thereto and secured to the outer ends thereof, removable guards adapted to be secured to each side of the reel by screws N' and O' and N'' and O'', said guards consisting of the bands L' and L'' with arms M' and M'' projecting inward therefrom and each provided with two L-shaped slots to engage said screws in the reel, and hubs H' and H'' journaled on the inner flanges of the hubs of the drive-wheels.

3. In a wire-reel truck the combination of the axle, transporting-wheels mounted on the ends thereof, a reel mounted between said wheels and journaled on the hubs thereof, the U-shaped member D each end of which is journaled on the outer flange of one of the hubs, and keys E' and E'' for securing the mechanism on the axle C, all substantially as shown and described and for the purposes set forth.

709,933. ROLLER PRINTING-MACHINE. THOMAS J. SMITH, Shotton, Flints-upon-Trent, England. Filed Apr. 15, 1902. Serial No. 102,966. (No model.)



Claim.—1. In a cylinder supporting and actuating device for printing-machines, the combination with a hollow printing-cylinder of a driving-spindle, a chuck having adjustable jaws on the end of said spindle, said jaws being adapted to engage in the end of the hollow printing-cylinder, a second spindle at the opposite end of the cylinder, a cone on the end of said spindle, and means for adjusting said second spindle and cone longitudinally so as to press the cone into the end of the cylinder.

2. In a cylinder supporting and actuating device for printing-machines, the combination with a hollow printing-cylinder of a driving-spindle, a chuck having adjustable jaws on the end of said spindle, said jaws

being adapted to engage in the end of the hollow printing-cylinder, a second spindle at the opposite end of the cylinder, a cone on the end of said spindle nearest to the cylinder, and a screw device having a bearing adapted to engage with the end of said second shaft, whereby the cone may be pressed into the end of the printing-cylinder to hold it in position.

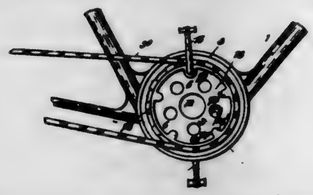
3. In a cylinder-supporting device for printing-machines the combination with a hollow printing cylinder, of a chuck adapted to engage in one end of said cylinder, a cone adapted to engage in the other end of said cylinder, means for pressing said cone into the cylinder end, a groove in the face of the cone, and a key adapted to engage in said groove and with the cylinder whereby the cone may be keyed to and caused to revolve with the cylinder.

4. In a supporting, and heating device for printing-cylinders, the combination with a hollow cylinder of a hollow spindle, a chuck on the end of said spindle adapted to engage in the cylinder end, bearings for said spindle, means for admitting gas to the interior of said spindle, a perforated burner-tube extending into the printing-cylinder from the end of said spindle, a cone adapted to engage in the other end of said cylinder, a hollow spindle upon which said cone is carried, a passage through said cone communicating with the interior of said spindle, and means for withdrawing the waste gases from said spindle.

5. In a supporting, actuating and heating device for printing-cylinders, the combination with a hollow cylinder of a spindle, means for actuating said spindle, a chuck on the end of said spindle adapted to engage in the cylinder end, a burner-tube formed within said spindle and extending within said cylinder, means for admitting gas to the interior of said spindle, means for supporting the other end of said cylinder, and means for taking off the waste gases from the latter end of said cylinder.

6. In a supporting, actuating and heating device for printing-cylinders, the combination with a hollow cylinder of a hollow spindle, means for actuating said spindle, a perforated tube extending from said spindle into the cylinder, means for admitting gas to said hollow spindle, a hollow shaft at the other end of said cylinder, means for supporting the cylinder upon said shaft, means for drawing off the waste gases from said hollow shaft, and a graduated thermometer whereby the temperature of the gases in the printing-cylinder may be seen and regulation of temperature facilitated.

709,984. BICYCLE SPROCKET AND CRANK. GIDEON STRONG, Newport, R. I. Filed July 16, 1901. Serial No. 68,773. (No model.)



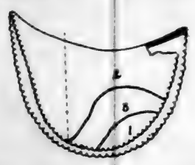
Claim.—1. A cycle-sprocket, comprising a central stationary casing, a revolvable disk mounted centrally within the same and provided with an angular aperture, a sprocket-ring connected with said disk and spaced asunder therefrom for the purpose of alinement with another sprocket, and a crank-arm provided with an angular portion for engaging the said angular aperture of the disk, said crank-arm serving the double purpose of retaining said disk and sprocket together and of causing the same to rotate.

2. A cycle-sprocket, comprising a fixed annular casing provided with a raceway, a revolvable disk provided with a comparatively thin edge for entering said raceway and with shouldered edges and also provided with angular apertures for engaging crank members, rolling bodies located in said raceway and engageable by said disk, a sprocket-ring connected to said disk and spaced apart therefrom, and crank members connected with said disk for rotating the same, one of said crank members passing through the sprocket-ring and constituting a fastening between the same and said disk.

3. A cycle-sprocket comprising a revolvable disk provided with an aperture, a sprocket-ring also provided with an aperture, cylindrical bolts detachably engaging said revolvable disk and said sprocket-ring for the purpose of removably securing said disk and sprocket-ring together, and of spacing said parts asunder, and a crank-arm extending through said aperture in said sprocket-ring and engaging said aperture in said disk, thus serving as an additional fastening for securing said disk and said sprocket-ring together, and also serving to rotate said parts.

709,985. DRESS-SHIELD. ALEXANDER T. STEVENSON, Bay City, Mich. Filed June 21, 1901. Serial No. 65,305. (No model.)

Claim.—1. In a dress-shield the combination with an inner folded lining having a thin flexible leaf of non-corrosive metal connected thereto and covering one side thereof; of a round cord secured in the fold of the inner lining, and an outer lining removably secured to said inner lining, substantially as described and for the purposes set forth.



2. In combination with a dress-shield having an inner and outer folded lining and a thin folded leaf of flexible non-corrosive metal interposed between said linings; a round cord secured to the fold of one of said linings beneath the fold of the metal sheet, for the purposes set forth.

3. A dress-shield comprising an inner cloth lining, a thin flexible leaf of non-corrosive metal secured to said lining and covering the entire area of one side thereof, together with an outer cloth lining removably sewed to the inner lining over the metal leaf, substantially as described and for the purposes set forth.

4. In combination with the inner and outer linings of a dress-shield, a thin leaf of flexible non-corrosive metal interposed between said linings, and covering the entire area of their contiguous surfaces, substantially as described.

709,986. PACKAGE-CARRIER. EDGAR J. STEWART, Chicago, Ill. Filed Jan. 22, 1902. Serial No. 90,791. (No model.)

Claim.—1. A package-carrier comprising a tubular handle having a transverse groove on one side thereof communicating with the passage of the tube, and slots in the wall of the tube extending from the ends of the transverse groove to the opposite ends of the tube.

2. A package-carrier comprising a tubular handle having a transverse groove on one side thereof communicating with the passage of the tube, and inclined slots in the wall of the tube extending from the ends of the transverse groove to the opposite ends of the tube.

3. A package-carrier comprising a tubular handle having a transverse groove on one side thereof communicating with the passage of the tube, and spiral slots in the wall of the tube extending from the ends of the transverse groove to the opposite ends of the tube.

4. A package-carrier comprising a tubular handle having a diagonal groove on one side thereof communicating with the passage of the tube, and spiral slots in the wall of the tube extending from the ends of the transverse groove to the opposite ends of the handle, the said slots being spiraled in the same direction.

5. A package-carrier comprising a tubular handle having a transverse groove on one side thereof communicating with the passage of the tube, slots in the wall of the tube extending from the ends of the transverse groove to the opposite ends of the tube, and a right-angle slot at each end of the tube on the under side thereof and providing a lug, the said lug being grooved.

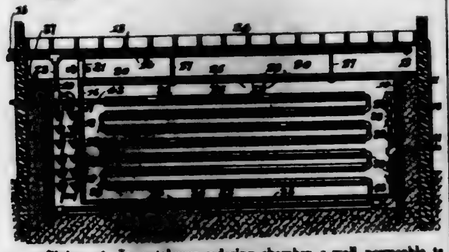
709,987. COW-TAIL HOLDER. JAMES D. STRONG, Buffalo, Minn. Filed Mar. 31, 1902. Serial No. 100,689. (No model.)

Claim.—1. A cow-tail holder involving a pair of pincers and a flexible connection attached to the same, which pincers have the curved jaws 3 with radial extensions or ends equipped with teeth 4, which jaws 3 are adapted to embrace the cow's tail, and which teeth 4 are adapted to pass through the hank of the tail, substantially as described.

2. In a cow-tail holder, the combination with the pincers 1 and 2, of the coil-spring 8 connecting said pincers, the pincers 1 being provided with the curved jaws 3 having the extended radial ends equipped with the interlapping teeth 4, and said pincers 1 being provided with the spring 5, and said pincers 2 being provided with the serrated jaws 6 and having the spring 7, with all of said parts arranged to coöperate, substantially as described.

709,987.

709,988. TOBACCO-ORDERING CHAMBER. JAMES M. TALIAFERRO, Lynchburg, Va. Filed July 1, 1901. Serial No. 66,716. (No model.)



Claim.—1. In a tobacco-ordering chamber, a wall permeable to moisture, means for supplying a liquid to the rear face of the wall, and a heater located adjacent to the exposed face of the wall.

2. In a tobacco-ordering chamber, a wall permeable to moisture, means for supplying a liquid to the rear face of the wall, and heating-pipes secured to the exposed face of the wall.

3. In a tobacco-ordering chamber, a wall permeable to moisture, absorbent material located against the rear face of the wall, means for supplying water to the absorbent material, and a heating device located adjacent to the exposed face of the wall.

4. In a tobacco-ordering chamber, a tobacco-receiving chamber, an air-flue having an air-inlet, one wall of said flue being permeable to moisture, an absorbent filling located against the rear face of the wall, means for supplying water to the filling, a distributing air-chamber having a communication with the air-flue and provided with an escape-orifice communicating with the tobacco-receiving chamber, and a fan for creating and driving a current of air through the flue and into the distributing-chamber.

5. In a tobacco-ordering chamber, an upright flue having an air-inlet, one wall of said flue being permeable to moisture, an absorbent filling located against the rear face of the wall, means for supplying water to the filling, a distributing air-chamber located in the upper portion of the ordering-chamber and having communication with the air-flue, said chamber being provided with escape-orifices that communicate with the chamber, and a fan for creating and driving a current of air through the flue and into the distributing-chamber.

6. In a tobacco-ordering chamber, side walls comprising an outer moisture-proof sheathing, an inner sheathing permeable to moisture, a filling of earth located between and resting against the inner faces of the sheathings, and a perforated water-supply pipe arranged longitudinally above the earth.

7. In a tobacco-ordering chamber, side walls comprising an outer moisture-proof sheathing, an inner sheathing of brick spaced from the outer moisture-proof sheathing, a filling of earth located between the sheathings and resting against the inner face of the brick, and means for supplying water to the earthen filling.

8. In a tobacco-ordering chamber, a floor made of absorbent material, a deck located over and spaced from the floor forming an intermediate air-space, said deck being provided with an air-inlet, an air-conducting flue leading from the air-space to the upper portion of the chamber, an air-distributing chamber located in the upper portion of the ordering-chamber, said distributing-chamber having a communication with the air-flue and provided with discharge-orifices, and means for creating a current of air and driving it from the lower air-space through the flue into the distributing-chamber.

9. In a tobacco-ordering chamber, an earthen floor, a deck comprising spaced slats located over said floor and forming an intermediate air-space, an air-conducting flue leading from the air-space to the upper portion of the ordering-chamber, an air-distributing chamber communicating with the air-flue and having its lower wall consisting of spaced slats, and a fan for creating a current of air and driving it from the lower air-space through the flue and into the distributing-chamber.

10. In a tobacco-ordering chamber, a floor made of absorbent material, a deck located above the floor whereby an air-space is formed between the deck and floor, said deck having an air-inlet and an air-outlet that are in communication with the chamber, means for supplying water to the floor, and means for passing a current of air over the floor and through the outlet.

11. In a tobacco-ordering chamber, the tobacco-receiving chamber, an end wall comprising an inner sheathing permeable to moisture, an absorbent filling located in rear of the sheathing, means for supplying a liquid to the absorbent, a partition located adjacent to but spaced from the sheathing and forming an intermediate passage-way or flue which is in communication with the said chamber, and means for passing a current of air through said passage-way.

12. In a tobacco-ordering chamber, a floor made of absorbent material, a deck located over and spaced from the floor forming an air-receiving chamber, said deck being provided with an air-inlet, air-moistening means located in the air-receiving chamber, an inclosed air-flue leading from the air-space to the upper portion of the ordering-chamber, and a fan for driving the air from the air-space and into the flue.

13. In a tobacco-ordering chamber, an earthen floor, means for moistening said floor, a deck located over and spaced from the floor forming an intermediate space, said deck being provided with an air-inlet, an air-conducting flue leading from the air-space to the upper portion of the chamber, vertically-disposed rows of troughs arranged in said flue, absorbent wicks leading from one trough to the next, an air-distributing chamber arranged in the upper portion of the ordering-chamber, said distributing-chamber having a communication with the air-flue and provided with discharge-orifices, and a fan for creating a current of air and driving it from the lower air-space through the flue and into the distributing-chamber.

14. In a tobacco-ordering chamber, an end wall comprising an inner sheathing permeable to moisture, an absorbent filling located in rear of the sheathing, means for supplying a liquid to the absorbent, a partition located adjacent to but spaced from the sheathing and forming an intermediate passage-way, and a fan for creating a current of air in said passage-way.

15. In a tobacco-ordering chamber, an end wall comprising an inner sheathing permeable to moisture, an absorbent filling located in rear of the sheathing, a water-supply pipe arranged above the filling, a partition located adjacent to but spaced from the sheathing forming an intermediate air passage-way, a deck located above the floor of the chamber forming an intermediate air-space that is connected with the passage-way said deck being provided with an air-orifice, and a fan for creating a current of air in said passage-way and air-space.

16. In a tobacco-ordering chamber, an end wall comprising an inner permeable sheathing, an earthen filling located in rear of the sheathing, a supply-pipe located above the earthen filling, a partition arranged adjacent to but spaced from the sheathing forming an intermediate passage-way, an earthen floor, a water-supply pipe arranged upon the floor, a deck disposed over the floor and forming an intermediate air-space that is connected with the passage-way, said deck being provided with an air-orifice, a ceiling, a wall arranged beneath the ceiling and forming a distributing-chamber therebetween which communicates with the air passage-way, said wall having a discharge orifice, and a fan for moving the

air from the lower air-space through the flue and into the distributing-chamber,

17. In a tobacco-ordering chamber, a wall comprising an inner sheathing permeable to moisture, an absorbent filling located against the rear face of the sheathing, means for supplying a liquid to the absorbent, and heater-pipes arranged upon the exposed face of the sheathing.

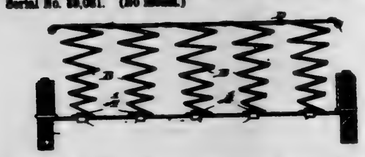
18. In a tobacco-ordering chamber, side walls comprising spaced sheathings, the inner of which is permeable to moisture, an earthen filling arranged between the sheathings, a perforate water-pipe disposed over the filling, heater-pipes mounted upon the exposed face of the inner sheathing, and casings covering the heater-pipes.

19. A tobacco-ordering chamber having an air-conducting flue, an air-moistener consisting of troughs arranged one below the other within the flue, absorbent wicks leading from one trough to the next, and means for generating and moving a current of air over said moistener.

20. In a tobacco-ordering chamber, a floor, a deck comprising spaced slats located over said floor and forming an intermediate air-space, an air-conducting flue leading from the air-space to the upper portion of the ordering-chamber, an air-distributing chamber communicating with the air-flue, and a fan for creating a current of air and driving it from the lower air-space through the flue and into the distributing-chamber.

21. In a tobacco-ordering chamber, a floor, a deck located over and spaced from the floor forming an intermediate space, provided with an air-inlet, an air-conducting flue leading from the air-space to the upper portion of the chamber, rows of troughs arranged in said flue, absorbent wicks leading from one trough to the next, an air-distributing chamber arranged in the upper portion of the ordering-chamber, said distributing-chamber having a communication with the air-flue and provided with discharge-orifices, and a fan for creating a current of air and driving it from the lower air-space through the flue and into the distributing-chamber.

709,939. COUCH. CLARK F. TRAVER, Erie, Pa., assignor to Wilcox Brothers, Joliet, Ill., a Corporation of Illinois. Filed Jan. 9, 1902. Serial No. 88,081. (No model.)



Claim.—In a couch, in combination, a frame; spiral springs supported by the frame; longitudinal side wires; and zigzag cross-wires extending between alternate opposite springs and secured to said springs near the upper ends of the latter, said cross-wires having loops at their ends for surrounding said longitudinal side wires for providing a sliding and yielding connection between the cross-wires and the side wires.

709,940. VALVE-LEVER SPOOL. PHILIP THOMAS, Brooklyn, N. Y., assignor to Henry R. Worthington, a Corporation of New Jersey. Filed Dec. 19, 1901. Serial No. 86,490. (No model.)

Claim.—1. A valve-lever spool consisting of a piece of metal with piston-rod opening 1 at one side of the center and groove 7 and ears 8 at the opposite side of the center adapted to receive the valve-lever, substantially as described.

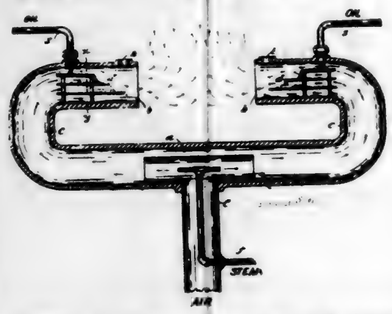
2. A valve-lever spool consisting of a cylindrical piece of metal with piston-rod opening 1 at one side of the center of the spool and with the center of the piston-rod opening in line with the center of the spool, and groove 7 and ears 8 at the opposite side of the center adapted to receive the valve-lever, and having position-pin opening 2 transverse to and intersecting the piston-rod, and a set-screw opening 5 on the opposite side of the piston-rod opening from the position-pin opening, substantially as described.

3. The combination with piston-rod C and valve-lever A, of spool D formed of a piece of metal with piston-rod opening 1 at one side of the center, and groove 7 and ears 8 at the opposite side of the center receiving the valve-lever, and means for securing the spool on the piston-rod, substantially as described.

4. The combination with piston-rod C and valve-lever A, of spool D formed of a cylindrical piece of metal with piston-rod opening 1 at one side of the center of the spool and with the center of the piston-rod opening in line with the center of the spool, and groove 7 and ears 8 at the opposite side of the center receiving the valve-lever, position-pin 3 passing through opening 2 in the spool and notch 4 in the piston-rod, and set-screw 6 bearing against the piston-rod on the opposite side from the position-pin, substantially as described.

5. A spool for connecting a lever to a reciprocating rod consisting of a cylindrical piece of metal with opening 1 for the rod at one side and in line with the center of the spool, and groove 7 and ears 8 on the opposite side of the center adapted to receive the lever, substantially as described.

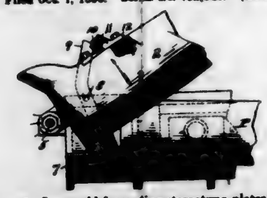
709,941. OIL-BURNER. SABIEN M. TRAFF, San Diego, Cal. Filed Sept. 25, 1901. Serial No. 76,269. (No model.)



Claim.—1. In an oil-burner, the combination with a burner-pipe circular in cross-section and having two oppositely-arranged discharge branches, oil-supply pipes communicating with the discharge branches, and air and steam supply pipes communicating with the burner-pipe, of a series of shelves arranged in each discharge branch, beneath the oil-supply pipes, said shelves disposed at a slight incline toward the discharge end of the discharge branches, and the uppermost shelf having side flanges and a flange at its rear end, the said shelves being stepped at one end whereby the oil spreads over the surface of each shelf before being discharged therefrom, as and for the purpose described.

2. In a device of the character described, the combination of a burner having integral oppositely-arranged discharge branches circular in cross-section, means for feeding air or steam to said burner, oil-supply pipes communicating with the discharge-orifices, and shelves arranged within the discharge branches under the discharge of the supply-pipes, the ends of the shelves adjacent the discharge of the branches being stepped, with side and rear end flanges on the uppermost shelf, as and for the purpose described.

709,942. CASTING-BOX. EDWIN D. TURNER, New York, N. Y., assignor, by direct and mesne assignments, to Robert Hoe and Charles W. Carpenter, under the firm-name of R. Hoe & Company, New York, N. Y. Filed Oct. 7, 1899. Serial No. 732,846. (No model.)



Claim.—1. In a mold for casting stereotype-plates, the combination with the body and cover, one of said parts being movable, of means operated by the movable part for displacing the plate lengthwise of the mold, said means being thrown into operation by the act of opening the box, substantially as described.

2. In a mold for casting stereotype-plates, the combination with the body and the movable cover, of means for displacing the plate lengthwise of the mold, and devices positioned to be operated by the cover for throwing said means into operation when the box is opened, substantially as described.

3. In a mold for casting stereotype-plates, the combination with the body and cover, of a movable head-gage, and mechanism operating on the gage for giving it a movement to displace the plate lengthwise of the mold, substantially as described.

4. In a mold for casting stereotype-plates, the combination with the body and cover, of a pivoted head-gage, and mechanism operating on the gage to swing it on its pivot whereby it displaces the plate lengthwise of the mold, substantially as described.

5. In a mold for casting stereotype-plates, the combination with the body and cover, one of said parts being movable, of a movable head-gage and means whereby the movable part moves the gage when the box is opened, the movement of the gage serving to displace the plate lengthwise of the mold, substantially as described.

6. In a casting-box, the combination with the body and cover, of a movable head-gage, and means actuated by the cover for moving said head-gage to displace the cast when the box is opened, substantially as described.

7. In a mold for casting stereotype-plates, the combination with the body and cover, of a movable head-gage, and a projection moving with the cover and operating when the cover is lifted to move the head-gage and displace the cast, substantially as described.

8. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a head-gage, and means carried by the cover and operating to move the head-gage to displace the cast when the cover is turned on its pivot to open the box, substantially as described.

9. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a head-gage pivoted in the box, and a projection moving with the cover and operating when the cover is turned on its pivot to swing the head-gage on its pivot and displace the cast, substantially as described.

10. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a head-gage, and a projection moving with the cover and operating to move the head-gage to displace the cast when the cover is swung on its pivot, said projection being arranged to yield on the closing movement of the cover, substantially as described.

11. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a head-gage, and a spring-controlled projection moving with the cover and operating to move the head-gage to displace the cast when the cover is swung on its pivot, substantially as described.

12. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a head-gage also pivoted thereto, and a spring-controlled projection moving with the cover and operating when the cover is swung on its pivot to swing the head-gage on its pivot and displace the cast, substantially as described.

13. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a head-gage also pivoted thereto, and devices independent of the gage, said devices acting to swing the gage on its pivot to displace the cast lengthwise of the box when the box is opened, substantially as described.

14. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a projection on the cover, and a head-gage having a part lying in the path of the projection, whereby as the cover is swung on its pivot to open the box the projection strikes the head-gage and moves it to displace the cast, substantially as described.

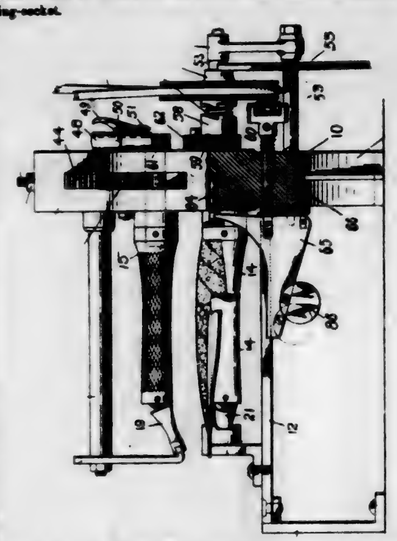
15. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a projection on the cover, and a pivoted head-gage having a part lying in the path of the projection, whereby as the cover is swung on its pivot to open the box the projection strikes the head-gage and turns it on its pivot to displace the cast, substantially as described.

16. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a projection pivoted to the cover, and a head-gage pivoted to the body and having a part lying in the path of the projection on the cover, the projection being arranged so that it strikes and moves the head-gage as the cover moves in one direction and turns on its pivot to allow the gage to pass as the cover moves in the other direction, substantially as described.

17. In a mold for casting stereotype-plates, the combination with the body, of a cover pivoted thereto, a projection pivoted to the cover, a spring for controlling the movement of the projection, and a head-gage pivoted to the body and having a part lying in the path of the projection on the cover, the projection being arranged so that it strikes and moves the head-gage as the cover moves in one direction and turns on its pivot to allow the gage to pass as the cover moves in the other direction, substantially as described.

709,948. CIGAR-MACHINE. WILLIAM A. TYRRER, Providence, R. I. Filed Jan. 31, 1902. Serial No. 92,003. (No model.)

Claim.—1. In a cigar-machine, the combination of three rolls shaped to form the body portion of a cigar, comprising two bottom rolls and a movable top roll, means for operating said rolls, a rigid piece having a thimbling-socket with a notch therein, a conical roll connected to the top roll at an angle with the axis thereof, and means for moving the top roll down so that its conical roll will set into said notch in the rigid thimbling-socket.



2. In a cigar-machine, the combination of a rigid piece having a thimbling-socket, and rolls abutting against and journaled in the rigid piece with their peripheries slightly overlapping the edges of the thimbling-socket.

3. In a cigar-machine, the combination of three rolls shaped to form the body portion of a cigar, comprising two bottom rolls and a movable top roll, means for operating said rolls, a rigid piece having a thimbling-socket with a notch therein, a conical roll connected to the top roll at an angle with the axis thereof, and adapted to set into said notch in the thimbling-socket, and short conical rolls connected with the bottom rolls at angles with their axes, and abutting against the thimbling-socket piece so that their edges slightly overlap the edge of the thimbling-socket.

4. A roll for cigar-machines shaped to conform to the body portion of a cigar, and having serring extending helically around the surface thereof.

5. The combination of the roll of a cigar-machine, a conical extension therefor, and a ball-and-socket joint connecting said parts, comprising a ball, a fastening-screw securing the ball on the spindle of the conical extension, a ring holding the ball in place, a screw threaded partly into the ring, and partly into the body portion of the roll to fasten the ring in place, and a screw acting as a spline and engaging a groove in the ball, said parts being arranged so that the walls of the spherical socket will prevent the fastening-screw from working loose.

6. In a cigar-machine, the combination of rolls shaped to form the body of a cigar, and a thimbling device for the end of the cigar, one of said rolls being provided with serring extending helically around the same and acting to feed the material toward the thimbling end of the machine.

7. In a cigar-machine, the combination of rolls shaped to form the body of a cigar, a thimbling device for the end of the cigar, a normally retracted pusher for engaging the other end of the cigar to force the same toward the thimbling end of the machine, and a starting device connected to release said pusher, permitting the same to automatically move into operative position when the machine is started.

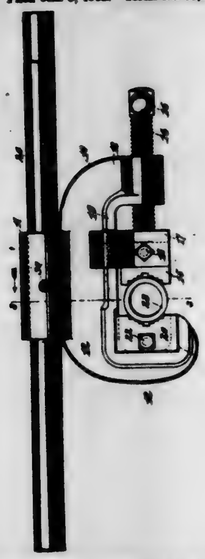
8. In a cigar-machine, the combination of rolls shaped to form the body of a cigar, a thimbling device for the end of the cigar, a plunger for engaging the opposite end of the cigar, a weighted bell crank for operating the plunger, the weight on which may be adjusted, and a spring-pressed retracting-rod normally holding the plunger out of operation, and arranged to release the pusher when engaged by the driving-pulley as the same is shifted laterally to start the machine.

9. In a cigar-machine, the combination of rolls shaped to form the body portion of a cigar, comprising bottom rolls, a vertically-movable piece, a top roll journaled therein, a handle for moving the top roll into and out of operative position, pinions turning with ends of said rolls, a central driving-gear arranged to mesh with and drive all three of said pinions when in operative position, and a starter-gear driven from one of

the bottom-roll pinions and located at one side of the center in position to start the rotation of the top roll before the same is fully brought into operative position.

10. In a cigar-machine, the combination of the bottom rolls, a vertically-movable piece, a top roll having its shaft seated in half-bearings in the vertically-movable piece, a spring holding the top roll down in its bearings, means for adjusting the tension of the spring, a rack carried by the vertically-movable piece, a lifting-gear meshing therewith, and an operating-handle for the lifting-gear for moving the top roll into and out of operative position.

709,944. PIPE-VISE. JOHN B. VOORHAAGE and THOMAS GRAY, Brooklyn, N. Y. Filed Jan. 3, 1902. Serial No. 88,572. (No model.)



Claim.—1. The portable vise comprising the frame, the gripping-jaws, and the operating-screw for the movable one of said jaws, combined with the longitudinal sleeve 11 at the outer edge of said frame and parallel with the axial center of said screw and adapted to receive the handle 24; substantially as set forth.

2. The portable vise comprising the frame, the operating-screw, the sliding frame 17 carried by said screw, and the jaws carried by said frames and recessed on their edges to offset the requisite gripping action, combined with the sleeve 11 constituting a part of said frame and adapted to receive the piece of pipe or handle by which the vise may be suspended; substantially as set forth.

3. The vise comprising the frame, operating-screw, sliding frame 17 carried by said screw, jaw 15 carried by said frame 17, and the jaws 20, and the vise-frame having the recesses 21 to receive said jaws 20, and said jaws 20 being drawn toward one another and held in said recesses by the bolt 23, combined with the sleeve 11 extending longitudinally of the vise-frame and at outer edge thereof, said sleeve 11 being adapted to detachably receive a handle 24 by which the vise may be suspended between the knees of a workman; substantially as and for the purpose set forth.

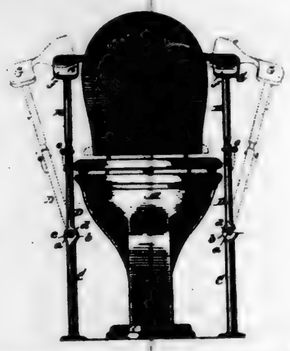
709,945. BACK AND ARM REST FOR WATER-CLOSET OR OTHER SEATS. HARRY J. WARE, Iowa City, Iowa. Filed Apr. 3, 1902. Serial No. 101,151. (No model.)

Claim.—1. A back and arm rest for water-closets and commodes, the back and arm rest being unattached and independent thereof, and means for rendering the same vertically adjustable, substantially as and for the purpose set forth.

2. A back and arm rest for water-closets and commodes, said back and arm rest being independent thereof and unattached thereto, and connected to a vertically-adjustable rod, substantially as and for the purpose described.

3. A back and arm rest for water-closets and commodes unattached thereto and independent thereof, said back and arm rest being integral and vertically adjustable, substantially as and for the purpose specified.

4. A back and arm rest for water-closets and commodes unattached thereto and independent thereof, said back and arm rest being substantially at right angles to each other and having a vertical adjustment, substantially as and for the purpose set forth.

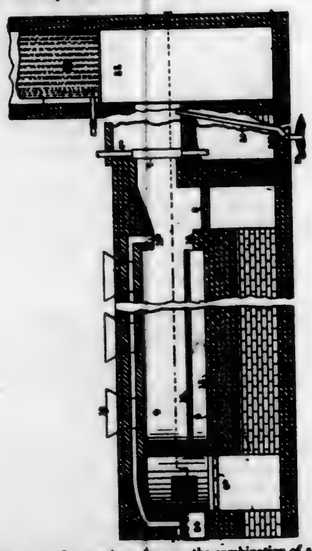


5. A back and arm rest for water-closets and commodes independent thereof and unattached thereto and having a vertical and lateral adjustment, substantially as and for the purpose specified.

6. A back and arm rest for water-closets and commodes, independent thereof and unattached thereto, a swingable standard, and a rod to which the back and arm rest is connected, said rod being adjustably connected to the standard, substantially as and for the purpose specified.

7. In a back and arm rest for the seats of water-closets or commodes, a stationary standard, a standard pivotally connected thereto, a rod carrying the back and arm rest and adjustably connected to the standard, and means for holding the rod in its adjusted position, substantially as and for the purpose specified.

709,946. GARBAGE-FURNACE. ROBERT I. WALKER, New York, N. Y. Filed Apr. 19, 1900. Serial No. 13,674. (No model.)



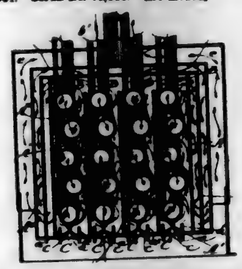
Claim.—1. In a garbage-furnace, the combination of a pair of fires, a wall separating said fires; a third fire and an imperforate false garbage-floor between said third fire and each of said first two fires, the said false floor being concave and being exposed both below and above to the action of the heat and flame.

2. In a garbage-furnace, the combination of three fires and an imperforate false garbage-floor, the said floor being concave and exposed both above and below to the action of the heat and flame and located between said fires so that two fires are consuming solid and liquid garbage and the third fire gases from said garbage.

3. In a garbage-furnace, the combination of three fires; an imperforate false garbage-floor; the said garbage-floor being concave and exposed both above and below to the action of the heat and flame and located between said fires so that two fires are consuming solid and liquid garbage and the third fire the gases from said garbage and means for reversing the draft over said fires.

4. In a garbage-furnace, the combination of a pair of fires located near the stack end of the furnace; a third fire located near the forward end of the furnace; an imperforate false garbage-floor, said floor being concave and exposed both above and below to the action of the heat and flame and located between said third fire and each of the pair of fires; a wall separating said garbage-floors and a swinging damper adapted to reverse the draft over said fires.

709,947. HEATER. WILLIAM L. WARNER, Chicago, Ill. Filed Sept. 26, 1901. Serial No. 76,606. (No model.)



Claim.—1. A heater comprising a chamber; approximately horizontal pipes in the chamber one above another connected consecutively in continuous course, the uppermost pipe being extended out through the wall of the chamber and serving as the cold-air inlet; and a pipe leading from the lowest of said pipes upward and out of the chamber; burners having their flames directed against the lowest pipe, the chamber having ingress for air to support combustion below the lowest pipe, and having egress for the products of combustion after passing to the upper part.

2. A heater comprising a chamber and plurality of air-ducts therein, each consisting of a plurality of approximately horizontal sections of pipe connected consecutively in continuous course, one above the other, the upper section of each duct leading out through the wall of the chamber, and serving as a cold-air inlet for the air-duct to which it pertains, the lowest section having connection leading upward and out of the chamber; independently-controlled burners under the lowest section of each of the ducts and means for causing the flame from each burner to circulate about the several sections of the ducts, respectively, under which they are located, to heat said ducts each independently of the remainder.

3. A gas-heater comprising a chamber and a plurality of air-ducts therein, each duct being arranged in successive pipe-sections one above another connected in continuous course emerging from the chamber at the upper end of the course, and having connection from the lowest section leading upward and also emerging from the chamber; burners located under said ducts respectively, and means for independently controlling said burners, the chamber having vertical partitions between said several air-ducts, whereby the flame and the current of products of combustion from each burner is confined about the pipe-section of the duct under which the burner is located, the chamber having escape for the products of combustion at the upper part and ingress for air at the lower part.

4. A gas-heater comprising a chamber and air-ducts therein, consisting of successively-connected pipe-sections one above another, forming a continuous course, said course of pipe leading out of the chamber at the upper part, and having connection from the lower end leading upward and out of the chamber; burners having their flames directed against the lowest section of said course and means for controlling each burner; the chamber having escape for the products of combustion at the upper part, and ingress for air to support combustion at the lower part.

5. A gas-heater comprising a chamber and an air-pipe consisting of zigzag courses one above another continuously connected, the upper course leading out of the chamber, and the lowest course leading upward and out of the chamber; burners underneath the lowest course, with means for controlling the same, the chamber having an interior false wall, an intermediate and outer wall with two inner spaces, the inner false wall being apertured at the upper part to permit the escape for the products of combustion, the intermediate wall being apertured at the lower part to continue such escape, and a final discharge being provided through the outer most wall at the upper part; whereby the gaseous products of combustion are taken from the top of the chamber and forced to circulate downward and upward before final escape.

6. A gas-heater comprising a chamber and air-duct in the chamber, consisting of a series of approximately horizontal sections one above another connected in continuous course, such ducts leading out of the chamber at the upper end, and having from its lower end connection leading upward and out of the chamber; burners under the lowest pipe-section; the chamber having ingress for air to support combustion, and egress for the product of combustion above the duct, said sections of the air-duct being placed with a narrow space at one side and a wider space at the opposite side for the passage of the gases of combustion, alternate sections having the spaces of corresponding width on opposite sides; whereby the current of gases of combustion is forced to circulate back and forth between the pipe-sections as it rises to escape from the chamber.

7. A gas-heater comprising a chamber and air-pipe duct in the chamber, consisting of successive sections one above another connected in continuous course, the uppermost section leading out of the chamber at the upper end, and the duct having connection from the lower end leading upward and out of the chamber; burners having their flame directed against the lowest section of the duct with means for controlling the same; the chamber having a false inner wall apertured at the upper part for the escape of gases and having a second wall outside such false wall apertured at the bottom for such escape.

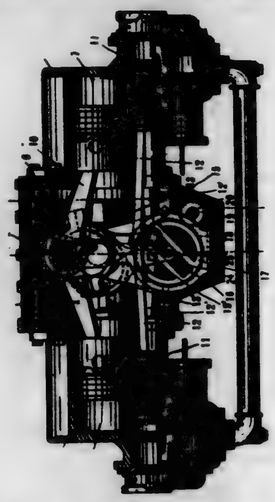
8. A gas-heater comprising a chamber and plurality of air-ducts therein each consisting of successively-connected pipe-sections, and elbows forming a continuous course leading out of the chamber at the upper part and having connection from the lower end leading upward out of the chamber; burners under the lower section of each such course means for controlling such burners; the wall of the chamber having an interspace and having apertures at the lower part leading into such interspace and apertures for the escape for the products of combustion leading from said interspace at the upper part of the chamber and jacket inclosing the chamber with an intervening air-space; accesses for air at the lower part of said air-space and a heating-pipe leading from the air-space at the upper part.

709,948. MEANS FOR PROMOTING COMBUSTION. FREDERICK W. WERNER, Hempstead, N. Y. Filed Apr. 21, 1900. Serial No. 13,732. (No model.)

Claim.—1. As a new article of manufacture the exit-pipe section B for stoves and furnaces, said pipe-section B presenting the usual exterior surfaces and having secured within it the inner concealed sleeve G forming the air-chamber H which is closed at its outer end to the interior of said section B and contains the restricted outlets at its inner end leading into the interior of said section B, said section B also having the inlet-apertures E for air to the outer end of said chamber, and said sleeve G being in the form of two truncated cones merging into one another and forming the contracted throat at their meeting ends; substantially as set forth.

2. As a new article of manufacture the exit-pipe section B for stoves and furnaces, said pipe-section B presenting the usual exterior surfaces and having centered within it the inner concealed sleeve G forming the air-chamber H which is closed at its outer end to the interior of said section B and contains the restricted outlets at its inner end leading into the interior of said section B, said section B also having the inlet-apertures E for air to the outer end of said chamber, and being provided at a point beyond the outer end of said sleeve G with the damper D; substantially as set forth.

709,949. VALVE-GEAR. PAUL H. WHITE, Indianapolis, Ind., assignor to White Steam Wagon Company, Indianapolis, Ind., a Corporation of Indiana. Filed Oct. 3, 1901. Serial No. 77,373. (No model.)



Claim.—1. In a valve-gear, the combination of a pair of eccentrics, a pair of straps and eccentric-arms mounted on said eccentrics, a pair of valves, intermediate connections between each valve and one of the eccentric-arms, means for engaging and guiding each of said eccentric-arms, and means for shifting said guiding means so as to simultaneously and oppositely offset both of the eccentric-arms.

2. The combination of two pairs of cylinders, a pair of eccentrics, an eccentric-arm carried by each eccentric, intermediate driving connections between said cylinders and the eccentrics, a valve for each cylinder, intermediate connections between the valves of one pair of cylinders and one of the eccentric-arms, intermediate connections between the valves of the other pair of cylinders and the other eccentric-arm, means for engaging and guiding both eccentric-arms, and means for shifting said engaging and guiding means so as to simultaneously and oppositely offset both eccentric-arms.

3. In a valve-gear, the combination of a pair of eccentrics, a pair of eccentric-arms mounted upon said eccentrics, a slide-block carried by each of said eccentric-arms, a pair of valves, a pair of links connecting said valves to said eccentric-arms, a circular plate having a single guide-slot adapted to receive both of the slide-blocks, means for supporting said plate, and means for rotating said plate in its support.

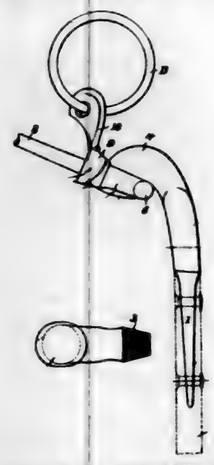
4. In a valve-gear, the combination of a pair of eccentrics, a pair of eccentric-arms mounted upon said eccentrics, a circular plate provided with means for engaging and guiding both of said eccentric-arms, a support for said plate, means for rotating said plate in its support, a pair of valves, and intermediate connections between each valve and an eccentric-arm.

5. The combination with a pair of high-pressure cylinders and a pair of low-pressure cylinders, of a pair of eccentrics, intermediate driving connections between said cylinders and the eccentrics, an eccentric-arm carried by each of said eccentrics, a pair of valves for the high-pressure cylinders, intermediate connections between the said pair of valves and one of the eccentric-arms, a pair of valves for the low-pressure cylinders, intermediate connections between said pair of valves and the other eccentric-arm, a circular plate provided with means for engaging and guiding both eccentric-arms, a support for said plate, and means for rotating said plate in its support.

6. The combination with two pairs of cylinders, of a pair of eccentrics, an eccentric-arm carried by each eccentric, intermediate driving connections between said cylinders and the eccentrics, a valve for each cylinder, intermediate connections between the valves of one pair of cylinders and one of the eccentric-arms, intermediate connections between the valves of the other pair of cylinders and the other eccentric-arm, a circular plate provided with means for engaging and guiding both eccentric-arms, a support for said plate, and means for rotating said plate in its support.

7. In a valve-gear, the combination of an eccentric, an eccentric-arm mounted thereon, a valve, intermediate connections between said arm and valve, a circular plate, means carried by said plate for engaging and guiding the eccentric-arm, a fixed support for the plate, a series of gear-teeth carried by said plate, and a rotatable pinion arranged to engage said gear-teeth, for the purpose set forth.

709,950. HAME AND TRACE CONNECTOR. GEORGE B. WITTENS, Marion, Iowa. Filed Aug. 1, 1901. Serial No. 70,488. (No model.)



Claim.—1. A hame-clip adapted to be rigidly attached to the front end of a hame-tug or trace in the line of draft, and constructed with a rigid body curved laterally toward the hame and terminating in a strong rounded neck and a flaring head, in combination with a staple having a bow through which said neck extends and against the front of which it is adapted to pull, and a bold-out bearing against which said flaring head of the clip is adapted to press at the back of the staple, substantially as hereinbefore specified.

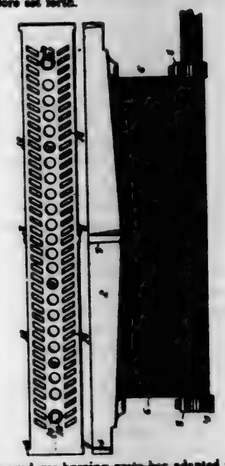
2. A combined hame-clip, staple and bold-out bearing comprising a clip adapted to be rigidly attached to the front end of a hame-tug or trace in the line of draft, and constructed with a rigid body curved laterally toward the hame and terminating in a strong rounded neck and a flaring head, a staple having a heavy rounded bow and a bold-out bearing constructed with a rounded notch in its back, the surfaces of said bow and bearing merging into each other and loosely fitted to said neck and to the adjoining side of said head of the clip, substantially as hereinbefore specified.

709,951. GAS-BURNING GRATE-BAR. JOHN A. ADAMS, Akron, Ohio. Filed Aug. 5, 1901. Serial No. 70,987. (No model.)

Claim.—1. An improved gas-burning grate-bar consisting of a bar adapted to be interposed in a furnace having a line of tubes integral therewith with mixing-tubes in alinement therewith and slightly separated therefrom, and a gas-supply pipe having jet-openings coincident with the lower ends of said mixing-tubes and slightly separated therefrom, substantially as shown and described.

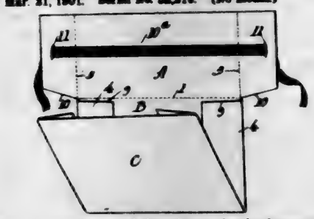
2. An improved gas-burning grate-bar consisting of a bar adapted to be interposed in a furnace having a line of tubes integral therewith, with mixing-tubes detachably connected, and in alinement therewith and slightly separated therefrom, and a gas-supply pipe detachably connected with said mixing-tubes having jet-openings coincident with the lower ends of said mixing-tubes slightly separated therefrom, substantially as shown and described.

3. An improved gas-burning grate-bar consisting of a bar adapted to be interposed in a furnace having a line of tubes integral therewith and lateral openings at the sides of said tubes, with mixing-tubes in alinement with said tubes and slightly separated therefrom and a gas-supply pipe having jet-openings coincident with the lower ends of said mixing-tubes, and slightly separated therefrom, substantially as and for the purpose hereinbefore set forth.



4. An improved gas-burning grate-bar adapted to be interposed in a grate having a line of tubes united with and extending from its lower face, their openings being coincident with holes in said grate-bar, in combination with mixing-tubes in alinement therewith and slightly separated therefrom, and a gas-supply pipe having jet-openings coincident with the lower end of said mixing-tubes and slightly separated therefrom, substantially as shown and described.

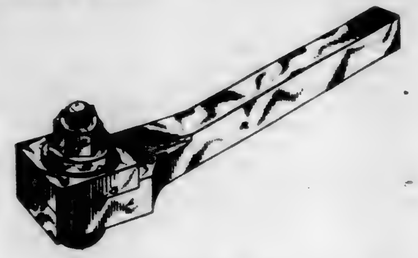
709,952. ENVELOP. ANDREW J. ARENDELL, Sparta, Tenn. Filed Mar. 21, 1901. Serial No. 52,216. (No model.)



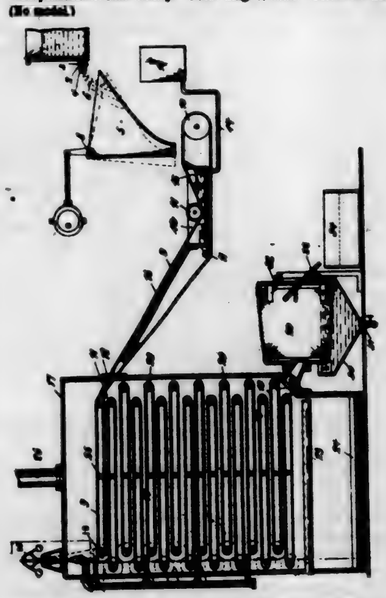
Claim.—An envelop, consisting of a pocket having an open edge, an address-front connected to one side of the open edge of the pocket and capable of being folded over upon the pocket to close the open edge thereof, opposite sealing-flaps carried by the opposite ends of the foldable front, and a cord lying across the inner side of the foldable front and projected outwardly through perforations in the end flaps, the projected ends of the cord being of a length for mutual connection when the envelop is sealed, whereby the cord is constructed and arranged to embrace the pocket.

709,953. TOOL-HOLDER. JOHN F. RACHMAN, Greensburg, Pa. Filed Feb. 15, 1902. Serial No. 94,169. (No model.)

Claim.—A tool-holder comprising a head carrying an integral shank with grooves formed in the upper face of the head, a clamp-nut carried by the head and having grooves upon its under side registering with said grooves of the head, an extension formed integral with the shank and head and having a groove formed on its upper side registering with one of the grooves on the said head for receiving the shank of the tool, a clamp-nut carried by the head and having grooves on its under side and registering with the grooves of the head, a bolt for clamping the clamp-nut to the head comprising a rounded apertured shank engaging the head and clamp-nut and having an enlarged milled head on its lower end forming a shoulder for engagement with the under side of the first-named head, a reduced threaded upper end on said bolt forming a shoulder, the clamp-nut being recessed to form a washer on its under side adapted for engagement with said last-named shoulder of the bolt, a nut upon the said threaded end of the bolt, the shank of the bolt being peripherally grooved, and a screw operating through the head and engaging in said groove of the bolt-shank, substantially as described.



709,954. APPARATUS FOR PRODUCING WHITE LEAD. JOHN W. BAILEY, Jersey City, N. J., assignor to the General Lead Company, a Corporation of New Jersey. Filed Aug. 1, 1900. Serial No. 25,503. (No model.)



Claim.—1. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a belt adapted to carry the comminuted lead into the corroding-chamber, means for supporting and moving the belt and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

2. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to support the comminuted lead and convey it into the corroding-chamber, means for supporting and moving the carrier, and means for supplying a suitable corroding-gas to the chamber, substantially as described.

3. In apparatus for making white lead or similar products, the combination with a corroding-chamber, a belt adapted to carry the comminuted lead into the corroding-chamber, means for supporting and moving the belt, means for feeding comminuted lead to the belt, means for supplying a moistening agent to the lead and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

4. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to support the comminuted lead and convey it into the corroding-chamber, means for supporting and moving the carrier, means for feeding comminuted lead to the carrier in masses wholly or partly separated, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

5. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the

comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, means for applying a moistening agent to the lead, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

6. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, means for comminuting the lead and feeding it into the feed-chute, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

7. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

8. In apparatus for making white lead or similar products, the combination with a corroding-chamber, a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, means to automatically maintain a predetermined level of the liquid in said bath, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

9. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, means for feeding comminuted lead to the carrier in masses wholly or partly separated, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

10. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

11. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, means for comminuting lead and feeding it into the feed-chute, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

12. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means adapted to support the comminuted lead in an uncompacted condition and carry it in that condition through said chamber and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

13. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a reticulated or permeable support adapted to carry the comminuted lead through said chamber, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

14. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means adapted to support the comminuted lead in an uncompacted condition and carry it in that condition into and through said chamber, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

15. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a reticulated or permeable support adapted to carry the comminuted lead into and through said chamber, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

16. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for supporting the comminuted lead and carrying it into said chamber without substantial disturbance, and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

17. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for supporting the comminuted lead and carrying it into and through said chamber without substantial disturbance, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

18. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a reticulated or permeable support for carrying comminuted lead into said chamber without substantial disturbance, and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

19. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a reticulated or permeable support for carrying comminuted lead through said chamber without substantial disturbance, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

20. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for supporting comminuted lead and carrying it into said chamber without substantial disturbance, means for feeding comminuted lead onto said carrier and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

21. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for supporting comminuted lead and carrying it into and through said chamber without substantial disturbance, means for feeding the comminuted lead onto said carrying means, and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

22. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for comminuting metallic lead so that it may be maintained in an uncompacted condition, means for supporting the comminuted lead and carrying it into said chamber without compacting it, said comminuting means being arranged to feed the comminuted material onto said carrying means, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

23. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for comminuting the lead in the form of fiber, and means for supporting the fiber and carrying it into said chamber without compacting it, said comminuting means being arranged to feed the comminuted lead onto said carrier and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

24. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means for so comminuting the lead as to form fiber, and means for supporting the fiber and carrying it into and through said chamber without compacting it, said comminuting means being arranged to continuously feed the fiber as it is formed onto said carrying means, means for supporting and continuously moving the carrying means, and means for supplying moisture to the corroding-chamber, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

25. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a reticulated or permeable support for carrying comminuted lead through said chamber without substantial disturbance, means for feeding comminuted lead to said support, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

26. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier, and means for supporting and moving the carriers in said chamber, whereby the lead in passing from one carrier to another is inverted or changed in position without substantial disturbance, substantially as set forth.

27. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier and means for supporting and moving the carriers in said chamber, whereby the lead in passing from one carrier to another is inverted or changed in position without substantial disturbance, substantially as set forth.

28. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier, and means for supporting and moving the carriers in said chamber, whereby the lead in passing from one carrier to another is inverted or changed in position without substantial disturbance, substantially as set forth.

29. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, means for comminuting the lead and feeding it into the feed-chute, means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier, and means for supporting and moving the carriers in said chamber, substantially as set forth.

30. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, means for feeding comminuted lead to the carrier in masses wholly or partly separated, a bath provided with a moistening agent, through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier, and means for supporting and moving the carriers in said chamber, substantially as set forth.

31. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier, a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers adapted to receive the lead from the first carrier, and means for supporting and moving the carriers in said chamber, substantially as set forth.

32. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the comminuted lead into the corroding-chamber, means for supporting and moving the carrier a feed-chute to feed comminuted lead to the carrier, the chute being adapted to rock on a pivot, means for rocking the chute, means for comminuting the lead and feeding it into the feed-chute, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier, and means for supporting and moving the carriers in said chamber, substantially as set forth.

33. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a series of traveling carriers for the lead arranged vertically in said chamber, each carrier overlapping the carrier above it at one end, means for supporting and moving said carriers, and means for supplying a suitable corroding-gas to the chamber whereby the lead in passing from one carrier to another is inverted without substantial disturbance, substantially as set forth.

34. In apparatus for making white lead or similar products, the combination with a corroding-chamber of means adapted to support the comminuted lead and convey it into and through the corroding-chamber, means for supporting and moving the carrying means, means for applying a moistening agent to the lead, and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

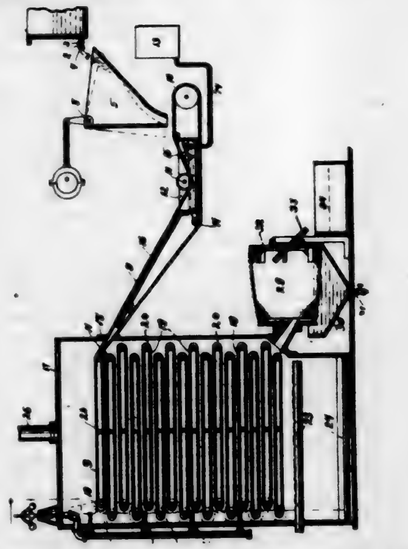
35. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of means adapted to support the comminuted lead and convey it into and through the corroding-chamber, means for supporting and moving said carrying means, means for moistening the comminuted lead while in the corroding-chamber, and means for supplying a suitable corroding-gas to the chamber substantially as set forth.

36. In apparatus for making white lead or similar products, the combination with a corroding-chamber, means for supporting and moving the carrier, a bath provided with a moistening agent through which the carrier moves before passing into the corroding-chamber so as to wet the comminuted lead, means for supplying a suitable corroding-gas to the chamber and means for moistening the comminuted lead in the corroding-chamber, substantially as set forth.

37. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a traveling carrier for the lead in said chamber, and, means for supporting and moving said carrier, means for moistening the comminuted lead in the corroding-chamber, and means for supplying a suitable corroding-gas to the chamber, substantially as set forth.

38. In apparatus for making white lead or similar products, the combination with a corroding-chamber, of a carrier adapted to convey the lead into the corroding-chamber, means for supporting and moving the carrier, means for supplying a suitable corroding-gas to the chamber, one or more traveling carriers for the lead in said chamber adapted to receive the lead from the first carrier, means for supporting and moving the carriers in said chamber, whereby the lead in passing from one carrier to another is inverted or changed in position without substantial disturbance, and means for moistening the comminuted lead in the corroding-chamber, substantially as set forth.

709,955. METHOD OF PRODUCING LEAD CARBONATE. JOHN W. BAILEY, Jersey City, N. J., assignor to the Union Lead and Oil Company, a Corporation of New Jersey. Filed Jan. 20, 1901. Serial No. 43,208. (No specimens.)



Claim.—1. The method of producing lead carbonate which consists in so comminuting metallic lead that it may be maintained in an uncompacted condition, conveying the lead in this condition without substantial disturbance into a corroding-chamber, causing it to move through said chamber without substantial disturbance and subjecting it therein to the action of a suitable corroding-gas whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated, substantially as described.

2. The method of producing lead carbonate which consists in so comminuting metallic lead that it may be maintained in an uncompacted condition, applying a moistening agent to the lead without disturbing the lead, conveying the lead in this condition without substantial disturbance into a corroding-chamber, causing it to move through said chamber without substantial disturbance and subjecting it therein to the action of a suitable corroding-gas whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated, substantially as described.

3. The method of producing lead carbonate which consists in so comminuting metallic lead that it may be maintained in an uncompacted condition, conveying the lead in a substantially undisturbed condition through a bath containing a moistening agent and then into a corroding-chamber, causing it to move through said chamber without substantial disturbance, and subjecting it therein to the action of a suitable corroding-gas whereby compacting of the comminuted lead is avoided and the uniform attack of the moistening and corroding agents is facilitated, substantially as described.

4. The method of producing lead carbonate which consists in subdividing metallic lead into a hair-like or fibrous condition, forming the lead thus comminuted into uncompacted waves or masses wholly or partly separated, applying a moistening agent to the lead without disturbing the lead, conveying the lead in this condition without substantial disturbance into a corroding-chamber, causing it to move through said chamber with-

out substantial disturbance and subjecting it therein to the action of a suitable corroding-gas whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated, substantially as described.

5. The method of producing lead carbonate which consists in forming lead fiber into uncompacted waves or masses wholly or partly separated, applying a moistening agent to the lead without disturbing the lead, conveying the lead in this condition without substantial disturbance into a corroding-chamber, causing it to move through said chamber without substantial disturbance and subjecting it therein to the action of a suitable corroding-gas whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated, substantially as described.

6. The method of producing lead carbonate which consists in comminuting the lead so as to form it into lead fiber, forming the lead fiber into unicompacted waves or masses, conveying the lead in this condition without substantial disturbance through a bath containing a moistening agent, then conveying the lead without substantial disturbance through the air and into a corroding-chamber, causing the lead to move through said chamber without substantial disturbance and subjecting it therein to the action of a suitable corroding-gas, substantially as described.

7. The method of producing lead carbonate which consists in comminuting the lead so as to form it into lead fiber, forming the lead fiber into unicompacted wave-like masses, applying a moistening agent to the lead without disturbing the lead, conveying the lead in a substantially undisturbed condition through the air for a certain distance and then into a corroding-chamber, causing it to move through said chamber without substantial disturbance, applying a moistening agent to the lead in said chamber and subjecting the lead in said chamber to the action of a suitable corroding-gas, substantially as described.

8. The method of producing lead carbonate which consists in so comminuting the lead that it may be maintained in an uncompacted condition, applying a moistening agent to the lead without disturbing the lead, forwarding predetermined quantities of the lead without substantial disturbance into the corroding chamber successively and at intervals, causing said lead to move in said corroding-chamber without substantial disturbance while each fresh supply of lead is being fed into said chamber and to remain at rest during the intervals between the forwarding operations, subjecting the lead in said chamber to the action of a suitable corroding-gas, substantially as described.

9. The method of producing lead carbonate which consists in conveying comminuted lead through a corroding-chamber and at suitable intervals inverting the lead therein without compacting the same, and subjecting the lead in said chamber to the action of a suitable corroding-gas whereby new surfaces are presented to the attack of the gas in a definite and organized manner, substantially as described.

10. The method of producing lead carbonate which consists in so comminuting the lead that it may be maintained in an uncompacted condition, applying a moistening agent to the lead without disturbing the lead, conveying the lead in this condition without substantial disturbance into a corroding-chamber, causing the lead to move through said chamber without substantial disturbance and at suitable intervals inverting the lead and subjecting it in said chamber to the action of a suitable corroding-gas, substantially as described.

11. The method of producing lead carbonate which consists in so comminuting the lead that it may be maintained in an uncompacted condition, applying a moistening agent to the lead without disturbing the lead, conveying the lead in this condition without substantial disturbance into a corroding-chamber, causing the lead to move through said chamber without substantial disturbance and at suitable intervals inverting the lead, applying a moistening agent to the lead in said chamber at intervals without disturbing the lead, and subjecting it in said chamber to the action of a suitable corroding-gas, substantially as described.

12. The method of producing lead carbonate which consists in arranging the comminuted lead so as not to compact it but to present an extended surface to the action of the different agents employed, applying to it in this condition a solution of acetic acid and water, passing it without substantial disturbance through the air to the corroding-chamber so as to form acetate of lead, causing it to move without substantial disturbance in said chamber for a period of time and exposing it during said time to the action of a current of carbonic-acid gas, then causing it to fall through said chamber for a sufficient distance to rearrange the mass without compacting it so as to expose new surfaces to the corroding-gas, then causing it to move again through said chamber and repeating this operation until the lead is sufficiently corroded, substantially as described.

13. The method of producing lead carbonate which consists in arranging the comminuted lead so as not to compact it but to present an extended surface to the action of the different agents employed, applying to it in this condition a solution of acetic acid and water, passing it without substantial disturbance through the air to the corroding-chamber so as to form acetate of lead, causing it to move without substantial disturbance in said chamber for a period of time and exposing it during said time to the action of a current of carbonic-acid gas, then causing it to fall through said chamber for a sufficient distance to rearrange the mass without compacting it so as to expose new surfaces to the corroding-gas, then causing it to move again through said chamber, moistening it at intervals in said chamber with a solution of acetic acid and water and repeating this operation until the lead is sufficiently corroded, substantially as described.

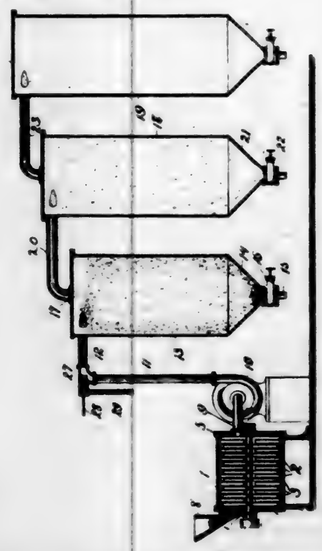
14. The method of producing lead carbonate, which consists in so comminuting metallic lead that it may be maintained in an uncompacted condition, conveying the lead in this condition into a corroding-chamber, and without substantial disturbance subjecting the lead therein to the action of a suitable corroding-gas, whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated.

15. The method of producing lead carbonate, which consists in so comminuting metallic lead that it may be maintained in an uncompacted condition, conveying the lead in this condition into a corroding-chamber, applying a moistening agent to the lead while in the corroding-chamber, and without substantial disturbance subjecting the lead in the corroding-chamber to the action of a suitable corroding-gas, whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated.

16. The method of producing lead carbonate, which consists in subdividing metallic lead into a fine hair-like or fibrous condition, conveying the lead in this condition without substantial disturbance into a corroding-chamber, and without substantial disturbance subjecting the lead in the corroding-chamber to the action of a suitable corroding-gas, whereby compacting of the comminuted lead is avoided and a uniform attack of the corroding agent is facilitated.

17. The method of producing lead carbonate which consists in subdividing metallic lead into a fine hair-like or fibrous condition, conveying the lead in this condition without substantial disturbance into a corroding-chamber, applying a moistening agent to the lead while in the corroding-chamber, and without substantial disturbance subjecting the lead in the corroding-chamber to the action of a suitable corroding-gas, whereby compacting of the comminuted lead is avoided and the uniform attack of the corroding agent is facilitated.

709,956. APPARATUS FOR PRODUCING WHITE LEAD. JOHN W. BAILEY, Jersey City, N. J., assignor to Union Lead and Oil Company, a Corporation of New Jersey. Filed Mar. 14, 1901. Serial No. 51,149. (No model.)



Claim.—1. An apparatus for producing lead carbonate comprising a corroding-chamber, means for introducing suitable corroding-gases into said chamber, and means for diffusing powdered lead in said chamber, substantially as described.

2. An apparatus for producing lead carbonate comprising a corroding-chamber, means for maintaining a current of a suitable corroding-gas in said chamber, and means whereby a quantity of pulverized or powdered lead may be uniformly subjected to the action of said current of corroding-gas, substantially as described.

3. An apparatus for producing lead carbonate comprising a corroding-chamber, means for maintaining a current of a suitable corroding-gas in said chamber, and means for diffusing powdered lead in said chamber, substantially as described.

4. An apparatus for producing lead carbonate comprising a corroding-chamber, means for maintaining a circulation of a suitable corroding-gas in said chamber, and means for diffusing powdered lead in said chamber, substantially as described.

5. An apparatus for producing lead carbonate comprising a corroding-chamber, means for supplying powdered lead to said chamber, an air-blast for diffusing the lead in said chamber, and means for maintaining a supply of a suitable corroding-gas in said chamber, substantially as described.

6. An apparatus for producing lead carbonate comprising a closed corroding-chamber having an inlet and suitably-screened outlet, of means for creating a blast through the inlet of said chamber, means for introducing powdered lead into said blast, and means for maintaining a supply of said corroding-gas in said corroding-chamber, substantially as described.

7. An apparatus for producing lead carbonate comprising a closed corroding-chamber having an inlet and a suitable screened outlet, means for creating a blast through the inlet of said chamber, and means for introducing powdered lead and a suitable corroding-gas into said blast, substantially as described.

8. An apparatus for producing lead carbonate comprising a substantially cylindrical vertically-arranged corroding-chamber having an inlet-passage tangentially arranged near the top, means for creating a blast through said inlet, means for introducing powdered lead into the blast, and means for maintaining a supply of a suitable corroding-gas in said chamber, substantially as described.

9. An apparatus for producing lead carbonate comprising a substantially cylindrical vertically-arranged corroding-chamber having an inlet-passage tangentially arranged near the top, means for creating a blast through said inlet-passage, and means for introducing powdered lead and a suitable corroding-gas into the blast, substantially as described.

10. An apparatus for producing lead carbonate comprising a substantially cylindrical vertically-arranged corroding-chamber having an inlet-passage tangentially arranged near the top, means for creating a blast through said inlet-passage, means for introducing powdered lead into the blast, and an injector for introducing steam and a suitable corroding-gas into the blast, substantially as described.

11. An apparatus for producing lead carbonate comprising a series of substantially cylindrical vertically-arranged corroding-chambers having tangential inlet-passages, the first of said chambers having substantially central outlet-passages communicating with the inlet-passages of the succeeding chambers and the last chamber having a screened outlet, means for creating a blast through the inlet-passage of the first chamber, means for introducing powdered lead into the blast, and means for maintaining a supply of a suitable corroding-gas in said chamber, substantially as described.

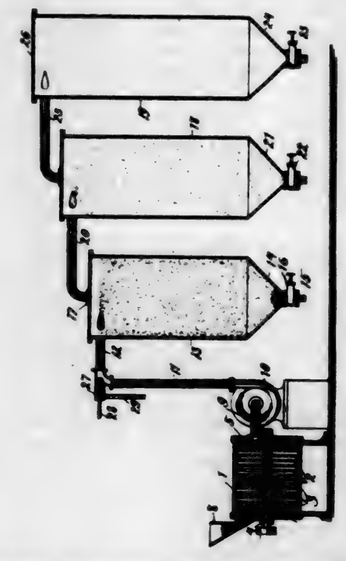
12. An apparatus for producing lead carbonate comprising a series of substantially cylindrical vertically-arranged corroding-chambers having tangential inlet-passages the first of said chambers having substantially central outlet-passages communicating with the inlet-passages of the succeeding chambers and the last chamber having a screened outlet, means for creating a blast through the inlet-passage of the first chamber, and means for introducing powdered lead and a suitable corroding-gas into the blast, substantially as described

13. An apparatus for producing lead carbonate comprising a series of substantially cylindrical vertically-arranged corroding-chambers having tangential inlet passages, the first of said chambers having substantially central outlet-passages communicating with the inlet-passages of the succeeding chambers and the last chamber having a screened outlet, means for creating a blast through the inlet-passage of the first chamber, means for introducing powdered lead into the blast, and an injector for introducing steam and a suitable corroding-gas into said blast, substantially as described.

14. An apparatus for producing lead carbonate comprising a series of substantially cylindrical vertically-arranged corroding-chambers having tangential inlet-passages, the first of said chambers having substantially central outlet-passages communicating with the inlet-passages of the succeeding chambers and the last chamber having a screened outlet, a fan-blower for creating a blast through the inlet-passages of the first chamber, a pulverizing-mill for supplying powdered lead to the blower, and an injector for introducing steam and a corroding-gas into the blast from the blower, substantially as described.

15. An apparatus for producing lead carbonate comprising a corroding-chamber, means for producing a current of finely-divided lead in said chamber, and means for producing a current of a suitable corroding-gas in said chamber, substantially as described.

709,957. METHOD OF PRODUCING WHITE LEAD. JOHN W. BAILEY, Jersey City, N. J., assignor to Union Lead and Oil Company, a Corporation of New Jersey. Filed Mar. 14, 1901. Serial No. 51,150. (No specimens.)



Claim.—1. The method of producing lead carbonate, which consists in subjecting lead in the form of an impalpable powder to the action of a suitable corroding-gas, substantially as described.

2. The method of producing lead carbonate, which consists in subjecting lead in the form of an impalpable powder to the action of a current of a suitable corroding-gas, substantially as described.

3. The method of producing lead carbonate, which consists in diffusing pulverized or powdered lead in a suitable corroding-gas, substantially as described.

4. The method of producing lead carbonate, which consists in diffusing pulverized or powdered lead in a current of a suitable corroding-gas, substantially as described.

5. The method of producing lead carbonate, which consists in floating pulverized or powdered lead in a suitable corroding-gas, substantially as described.

6. The method of producing lead carbonate, which consists in floating pulverized or powdered lead in a current of a suitable corroding-gas, substantially as described.

7. The method of producing lead carbonate, which consists in diffusing pulverized or powdered lead throughout a suitable corroding-gas confined in a closed chamber and creating a circulation of the gas in the chamber, substantially as described.

8. The method of producing lead carbonate, which consists in subjecting lead in the form of an impalpable powder to the action of a series of successive currents of a suitable corroding-gas, substantially as described.

9. The method of producing lead carbonate, which consists in floating pulverized or powdered lead in a suitable corroding-gas by means of a series of successive currents of said gas, substantially as described.

10. The method of producing lead carbonate, which consists in reducing lead to an impalpable powder and then subjecting it to the action of carbonic-acid gas and acetic acid in the presence of air and moisture, substantially as described.

11. The method of producing lead carbonate, which consists in reducing lead to an impalpable powder and then subjecting it to the action

of a corroding-gas composed of air, carbonic-acid gas, and vapors of acetic acid and water, substantially as described.

12. The method of producing lead carbonate, which consists in reducing lead to an impalpable powder and then floating the powder in a corroding-gas composed of air, carbonic-acid gas, and vapors of acetic acid and water, substantially as described.

13. The method of producing lead carbonate, which consists in dividing the lead into a fine condition producing a current of said finely-divided lead, and bringing said current into contact with a current of a suitable corroding-gas, whereby the lead is diffused throughout said current of gas and thoroughly exposed to the same, substantially as described.

14. The method of producing lead carbonate, which consists in pulverizing the lead passing a current of air through the pulverized lead so as to carry away the particles of lead that are fine enough to float in said current, bringing said current into contact with a current of a suitable corroding-gas, and causing the combined currents to intermingle and circulate together in a suitable chamber, substantially as described.

15. The method of producing lead carbonate, which consists in pulverizing the lead passing a current of air through the pulverized lead so as to carry away the particles of lead that are fine enough to float in said current, bringing said current into contact with a current of a suitable corroding-gas, and causing the combined currents to intermingle and circulate together in a suitable chamber, and filtering the gases as they escape from the chamber so as to prevent the loss of lead, substantially as described.

16. The method of producing lead carbonate, which consists in pulverizing the lead, passing a current of air through the pulverized lead so as to carry away the particles of lead that are fine enough to float in said current, bringing said current into contact with a current of a suitable corroding-gas, and causing the combined currents to circulate around the outer portion of a suitable chamber so as to produce an area of less disturbance in the middle of the chamber and leading off the waste gases from the middle portion of said chamber, substantially as described.

17. The method of producing lead carbonate, which consists in pulverizing the lead, passing a current of air through the pulverized lead so as to carry away the particles of lead that are fine enough to float in said current, bringing said current into contact with a current of a suitable corroding-gas, and causing the combined currents to circulate around the outer portion of a suitable chamber so as to produce an area of less disturbance in the middle of the chamber and leading off the waste gases from the middle portion of said chamber and filtering the gases as they escape from said chamber, substantially as described.

18. The method of producing lead carbonate, which consists in subjecting powdered lead to the action of suitable corroding-gases, the lead being in such a fine state of division that when the corroding action has once begun on a particle the entire particle will be corroded.

19. The method of producing lead carbonate, which consists in subjecting powdered lead to the action of carbonic-acid gas, air and the vapors of acetic acid and water, the lead being in such a fine state of division that when the corroding action has once begun on a particle the entire particle will be corroded.

20. The method of producing lead carbonate, which consists in diffusing powdered lead throughout a suitable corroding-gas, the lead being in such a fine state of division that when the corroding action has once begun on a particle the entire particle will be corroded.

21. The method of producing lead carbonate, which consists in diffusing powdered lead in a corroding-gas consisting of air, carbonic-acid gas and the vapors of acetic acid and water, the lead being in such a fine state of division that when the corroding action has once begun on a particle the entire particle will be corroded.

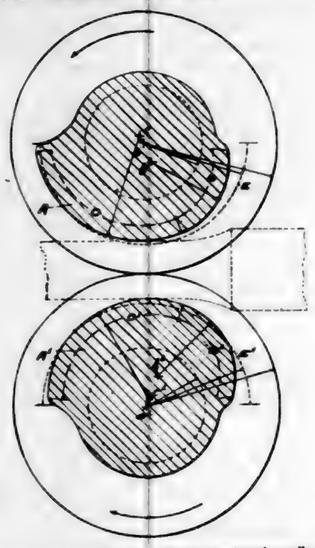
22. The method of producing lead carbonate, which consists in subjecting powdered lead to the action of suitable corroding-gases, the lead being in such a fine state of division that substantially all of the lead is at once exposed to the action of the corroding-gases.

23. The method of producing lead carbonate, which consists in subjecting powdered lead to the action of carbonic-acid gas, air and the vapors of acetic acid and water, the lead being in such a fine state of division that substantially all the lead is at once exposed to the action of the corroding-gases.

24. The method of producing lead carbonate, which consists in diffusing powdered lead throughout a suitable corroding-gas, the lead being in such a fine state of division that substantially all the lead is at once exposed to the action of the corroding-gas.

25. The method of producing lead carbonate, which consists in diffusing powdered lead in a corroding-gas consisting of air, carbonic-acid gas and the vapors of acetic acid and water, the lead being in such a fine state of division that substantially all the lead is at once exposed to the action of the corroding-gas.

709,958. ROLLING METAL TUBES OR OTHER HOLLOW OR SOLID BODIES. ARTHUR R. BODE, Barlaston, England, assignor to Perrins, Limited, Warrington, England, a registered Company. Filed Feb. 8, 1902. Serial No. 93,376. (No model.)



Claim.—1. A pair of gapped, pilger, or back-action rolls having eccentrically-grooved projecting or working portions, the eccentricity of one roll being different from that of the companion roll, substantially as set forth.

2. A pair of gapped, pilger, or back-action rolls having eccentrically-grooved projecting or working portions, corresponding portions of the respective grooves in the two rolls being of the same curvatures and other corresponding portions of different curvatures, substantially as described.

709,959. VEHICLE-TIRE. FRANK P. BRIGGS, Westgrove, Pa. Filed Feb. 14, 1902. Serial No. 93,992. (No model.)

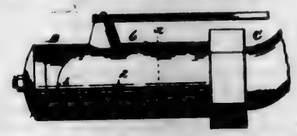
Claim.—1. A felly having an annular groove formed in the same, a ring of soft rubber secured within said groove, undercut grooves formed in the walls of the groove, a rubber tire, beveled edges or tongues formed upon the tire adapted to fit within the undercut grooves, an opening formed through the tire, a slit formed from the opening to the inner face of the tire, beveled surfaces formed upon the outside of the soft-rubber ring, beveled surfaces formed upon the inner face of the rubber tire adapted to fit upon the beveled surfaces of the ring, substantially as and for the purpose specified.

2. In a device of the character described, a felly having an annular channel formed therein, undercut grooves formed in the walls of said channel, a ring of soft rubber secured in the channel the outer face of said ring beveled upon each side, a tire having an opening formed therethrough, the inner face of said tire divided by a slit formed from the opening to the inner face, said tire so formed as to be sprung into the undercut grooves of the felly and to impinge upon the soft-rubber ring within the same so that the two portions of the inner edge of the tire will be spread by the beveled surfaces of said ring when pressure is applied to the tire, substantially as described and for the purpose specified.

709,960. STREET-SPRINKLER VALVE. MORTON G. BRIDELL, Chicago, Ill., assignor to F. G. Austin Manufacturing Company, Chicago, Ill., a Corporation. Filed Sept. 9, 1901. Serial No. 74,797. (No model.)

Claim.—1. A street-sprinkler valve comprising relatively adjustable

valve members adapted to separate or draw apart and provide a discharge opening or slot having relatively wide and narrow portions which cause the water to discharge in the form of a spray or sheet having relatively thick and thin portions and adapted to vary the size of said discharge-slot and at the same time maintain the relative proportions of the said relatively wide and narrow portions of the slot and thereby vary the volume of the discharge without changing or varying the relative proportions of said relatively thick and thin portions of the sheet or spray.



2. A street-sprinkler valve comprising relatively adjustable members, the space between said members when drawn apart forming a discharge opening or slot, said discharge opening or slot having relatively wide and narrow portions, so as to permit the water to escape in the form of a sheet or spray having relatively thick and thin portions, the relatively wide portion or portions of the slot or opening being practically or substantially transverse to the direction of said relative adjustment, and the relatively narrow portion or portions of said slot or discharge-opening being more or less oblique to the direction of said relative adjustment, so as to permit the discharge slot or opening to be opened and closed and the volume of the discharge varied without varying the relative proportions of the said relatively wide and narrow portions of the slot or discharge-opening.

3. A street-sprinkler valve comprising a cylindric head comprising two relatively adjustable members, the space between said members when drawn apart forming a circumferentially-extending discharge opening or slot, the two members having a relative formation adapted to provide said slot or discharge-opening with relatively wide said narrow portions, the relatively narrow portions of the discharge slot or opening being more or less oblique to the direction of said relative adjustment, so as to permit the slot or opening to be opened or closed and the volume of discharge varied without varying the relative proportions of the said relatively wide and narrow portions of the slot or opening.

4. A street-sprinkler valve comprising a cylindric, or substantially cylindric body portion, a cap fitted to slide upon said body portion and close the latter's open end, the discharge slot or opening formed by the joint or meeting surfaces of the cap and body portion being formed along a circumferentially-extending line which is curved or irregular, the curvature or irregularity of the line along which the discharge slot or opening is formed causing the latter to have relatively wide and narrow portions, the relatively wide portions of said slot or opening extending practically or substantially crosswise of the sprinkler-head formed by the said cap and body portion, and the relatively narrow portions of the discharge slot or opening being more or less oblique to the length of said head, whereby the said relatively wide and narrow portions of the slot or opening retain their relative proportions when the said cap is adjusted for the purpose of varying the volume of discharge.

709,961. ROTARY ENGINE. THOMAS J. BUSH, Lexington, Ky. Filed Mar. 24, 1902. Serial No. 99,703. (No model.)

Claim.—1. The combination, with a horizontal support provided with an annular fixed fulcrum, of a lever-forming ring resting loosely on said support eccentric to and fulcruming at its periphery against the inner wall of said annular fulcrum, a rotary means for discharging fluid under pressure against the inner wall of said ring at one side of its fulcrum-point, and means extending from the said ring at the other side of its fulcrum-point to the said rotary fluid-supply to rotate it from said ring.

2. A rotary engine or motor comprising, a fixed horizontal plate or support provided with a fulcrum ring or band, of a lever-forming ring engaging and of less diameter than the fulcrum-ring and resting loosely on said plate or support, a rotary fluid pipe or member arranged centrally of said plate or support and provided with a radial discharge-pipe having its outlet end in close proximity to the inner wall of said lever-forming ring, and a lever-forming arm projecting radially from said fluid pipe or member and engaging at its outer end the inner wall of said lever-forming ring; whereby the pipe or member will be rotated to form a drive means or shaft.

3. A rotary engine or motor comprising, a fixed horizontal plate or support provided with a fulcrum ring or band, and a lever ring or band engaging and of less diameter than the fulcrum-ring and resting loosely on said plate or support, of a central vertical rotary fluid-supply pipe projecting up therethrough and having an inlet-opening, a fluid cylinder or chamber surrounding the pipe at its inlet end and having a fluid-supply, a radial discharge-pipe extending from said rotary pipe or member into close proximity to the inner wall of said lever-forming ring, and a radial lever-arm projecting from said cylinder and provided at its outer end with an antifriction-roller engaging the inner wall of said lever-forming ring.

4. A rotary engine or motor comprising, a fixed horizontal plate or support provided with a fulcrum ring or band, and a lever ring or band engaging and of less diameter than the fulcrum-ring and resting loosely on said plate or support, of a central vertical rotary fluid-supply pipe projecting up therethrough, a fluid cylinder or head through which said pipe passes and is supplied with fluid therefrom, a radial discharge-pipe extending from said pipe into close proximity to the inner wall of said lever-forming ring, and a radial longitudinally-extensible lever-arm projecting from said pipe and provided at its outer end with an antifriction-roller engaging the inner wall of said lever-forming ring.

5. A rotary engine or motor comprising, a fixed horizontal plate or support provided with a fulcrum-forming ring on its upper side, a lever-forming ring smaller than and engaging said fulcrum-ring, a rotary fluid-supply pipe projecting up through the center of said plate or support, a fluid-supply cylinder on the under side of said horizontal plate and through which said rotary pipe passes, a discharge-pipe extending radially from said cylinder into close proximity to the inner wall of said lever-forming ring and formed in telescopic sections, and a radial lever-arm having an antifriction device at its outer end also engaging the inner wall of the said lever-forming ring and serving to rotate said rotary pipe therefrom.

6. A rotary engine or motor comprising, a base, standards projecting therefrom, a horizontal plate or support on the upper ends of the standards, a circular fulcrum-ring on the upper side of said plate or support, a vertical rotary pipe extended from the base up through the center of said plate or support, an adjustable bearing on the base for the lower end of said pipe, a cylinder or chamber through which the pipe passes and supplying it with fluid, a lever-forming ring resting loosely on said plate and in peripheral engagement with and of smaller size than the fulcrum-ring, a discharge-pipe extending radially from the rotary pipe into close proximity to the said lever-forming ring, and a radial lever-forming arm also projecting from the rotary pipe and having an antifriction device at its outer end in contact with the inner wall of the lever-forming ring.

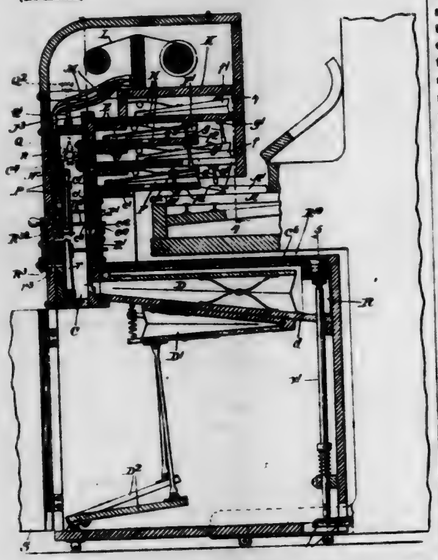
7. A rotary engine or motor comprising, a horizontal plate or support having a circular fulcrum-forming ring or flange, a lever-forming ring resting loosely on said plate or support, of less size than the fulcrum-ring and in peripheral engagement therewith; the inner wall of said lever-forming ring being provided with corrugations or pockets and a plain portion, a rotary fluid pipe or member at the center of said horizontal plate or support and provided with a radial discharge-pipe extending at its discharge end into close proximity to the corrugations or pockets of the lever-ring, and a lever-arm also projecting radially from said rotary pipe and provided at its outer end with an antifriction device engaging the plain portion of the lever-forming ring.

8. The combination, with a horizontal support provided with an annular fixed fulcrum, of a lever-forming ring resting loosely on said support, eccentric to and fulcruming at its periphery against the inner wall of said annular fulcrum, and a rotary pulley-forming or power-transmitting device provided with a radial extending-arm engaging the inner wall of said lever-forming ring at one side of its fulcrum-point and a radial pipe or conductor also projecting from said pulley-forming or power-transmitting device close to the inner wall of said lever-forming ring at a point to the other side of its fulcrum; the constant power or force from said pipe or conductor serving to roll the lever-ring on its fulcrum and in so doing causing the ring to rotate the pulley or power transmitting device through the medium of its extending-arm.

9. The combination, with a horizontal support provided with an an-

ruler fixed fulcrum, of a lever-forming ring resting loosely on said support, eccentric to and fulcruming at its periphery against said annular fulcrum, and a rotary pipe or power-transmitting member provided with a radial actuating-arm engaging the inner wall of said lever-ring at one side of its fulcrum-point, and a radial pipe also projecting from said rotary pipe or transmitting device close to the inner wall of the lever-forming ring at a point to the other side of its fulcrum-point; the outer end of the radial pipe being provided with an inclined port discharging the fluid against the lever-ring in a direction contrary to the direction of rotation of said rotary pipe or member.

709,962. **AUTOMATIC PLAYER FOR KEYED INSTRUMENTS.** MELVILLE CLARK, Chicago, Ill. Filed Dec. 4, 1899. Serial No. 739,190. (No model.)



Claim.—1. An automatic player for a keyed instrument, comprising motor-pneumatics having rigid projections which terminate beyond the case and air-chambers of the automatic player and are arranged to overhang and act directly upon the exposed surface of the manual-keys of the instrument to be played.

2. An automatic player for a keyed instrument, comprising motor-pneumatics located exterior to the wind-chest or air-chamber, by which they are controlled or actuated, the moving walls of such motor-pneumatics having rigid projections which terminate beyond the case of the automatic player and are arranged to overhang and act directly upon the exposed surfaces of the manual-keys of the instrument to be played.

3. An automatic player for a keyed instrument, comprising motor-pneumatics which are wholly exterior to the wind-chest or air-chamber by which they are controlled or actuated; the moving walls of such motor-pneumatics having rigid projections which are also wholly exterior to such wind-chest or air-chamber, and which terminate beyond the case and air-chamber of the automatic player and are arranged to overhang and act directly upon the exposed surfaces of the manual-keys of the instrument to be played.

4. An automatic player for a keyed instrument, comprising motor-pneumatics in position to overhang the manual-keys of the instrument to be played, said pneumatics having a moving wall, hinged at one end, fingers rigid with said moving wall, projecting downward therefrom between the hinge and the other end of the cavity of the pneumatic, and adapted to act directly upon the manual-keys respectively.

5. An automatic player for a keyed instrument, comprising two sets of motor-pneumatics for operating the keys of the instrument; one set of primary pneumatics, and ducts by which said primary pneumatics respectively control the corresponding motor-pneumatics of both sets, the ducts leading to the second set being provided with means for closing and opening the passage through them without affecting the ducts of the first set, whereby said first set may alone give the stroke to the keys, or may be reinforced by the second set when the ducts leading to the latter are open.

6. In an automatic player for a keyed instrument, in combination with a wind-chest erected vertically in front of the manual-breast of the instrument, motor-pneumatics located upstanding between the wind-chest and the manual-breast, and lever connections by which such motor-pneumatics cause the manual-keys to be struck.

7. In an automatic player for an instrument having a horizontal bank of manual-keys, a wind-chest erected vertically in front of the manual-breast of the instrument, a set of motor-pneumatics extended horizontally from the wind-chest to act upon the manual-keys, in combination with a second set of motor-pneumatics located upstanding between the wind-chest and the manual-breast, and lever connections between corresponding pneumatics of the two sets, by which the action of the latter set is directed upon the moving elements of the former set.

8. In an automatic player for a keyed instrument, in combination with a wind-chest, a system of motor-pneumatics supported by and deriving their air tension from such wind-chest, and projected horizontally therefrom toward the instrument to act upon the manual-keys of the latter; a second system of motor-pneumatics arranged vertically in the interval between the wind-chest and the manual-breast, each of the pneumatics in said second system being in vertical fore-and-aft plane with the corresponding pneumatic of the first system, the moving element of the pneumatics of one set having each a lever-arm which extends along the face of the moving element of the corresponding pneumatic of the other set, and an abutment on said element which encounters the lever-arm to cause the movement of one of said parts to be communicated to the other.

9. An automatic player for a keyed instrument comprising pneumatics for all the keys to be struck; a tracker-duct board and perforated music-sheet having respectively ducts and apertures for controlling the pneumatics pertaining to a portion, only, of the keys; a coupling-slide having ports adapted to register with the ducts of a portion of the pneumatics, and tubes from such ports respectively to the ducts of octave-distant pneumatics, the ducts at one end of the tubes being those for which the perforated music-sheet has controlling-apertures, and the ducts at the other end being beyond the range of the music-sheet.

10. In an automatic player for a keyed instrument, comprising pneumatics for all the keys to be struck, a tracker-duct board and perforated music-sheet having respectively ducts and apertures for controlling the pneumatics pertaining to a portion, only, of the keys; a coupling device, consisting of a slide having ports adapted to register with the ducts pertaining to the pneumatics which are to be coupled, and flexible tubes from the ports of one half of the entire set of ports on the slide to the corresponding ports of the other half of said set, and means for moving the slide at will to cause its ports to register or not to register with the pneumatic ducts respectively.

11. In an automatic player for a keyed instrument, in combination with the motor-pneumatics which operate the manual-keys, primary pneumatics which control them respectively; secondary pneumatics controlled by a lower or base-range portion of the system of said primary pneumatics, and motor-pneumatics which operate the pedal-keys of the instrument and connections by which said secondary pneumatics control said pedal motor-pneumatics.

12. In an automatic player for a keyed instrument, in combination with pneumatics for operating the manual-keys, other pneumatics for operating the pedal-keys, a perforated music-sheet and duct-board having, respectively, perforations and a system of ducts corresponding to a portion, only, of the manual; branch ducts from the ducts of the lower or base-range portion of the system of tracker-ducts, and primary pneumatics controlled through such branch ducts; secondary pneumatics controlled by said last-mentioned primary pneumatics, and connections by which the secondary pneumatics control the motor-pneumatics which operate the keys of the pedal-base.

13. In an automatic player for a keyed instrument, in combination with motor-pneumatics which operate the manual-keys, primary pneumatics which control them respectively; secondary pneumatics controlled by a lower or base-range portion of the system of said primary pneumatics; motor-pneumatics controlled by said secondary pneumatics and operating the pedal-keys of the instrument; the connection between said primary and secondary pneumatics by which the former control the latter comprising the slide, U^2, flexible tubes leading from its ports respectively, to the secondary pneumatics; and suitable means for adjusting the slide to register or not register with the air-passages controlled by the valves operated by the primary pneumatics.

14. In a pneumatically-operated automatic player for an instrument having manual-keys and pedal stops, in combination with the wind-chest, motor-pneumatics for operating the pedal-stops and mechanical connections therefrom to such pedal stops; primary pneumatics which control said pedal-stop motor-pneumatics; vent-valves for the primary pneumatics, and manual-stops for operating such vent-valves.

15. In combination with an instrument having a system of pedal-keys, the system of thrust-rods, X', and the frame in which they are mounted, secured in fixed relation to the pedal-keys, and an automatic player having motor-pneumatics arranged to overhang and operate upon the thrust-rods, respectively.

16. In combination with an instrument having a system of pedal-keys, the system of thrust-rods, X', the frame in which they are mounted secured in fixed relation to the pedal-keys; the automatic player having motor-pneumatics which are arranged to act upon the thrust-rods respectively, said rods having adjustable terminals to receive the action of the motor-pneumatics.

17. In combination with an instrument having a system of pedal-keys, the system of thrust-rods, X'; the frame in which they are mounted, secured in fixed relation to the pedal-keys; springs which tend to uphold the thrust-rods respectively; the automatic player having motor-pneumatics arranged to act upon the thrust-rods, said thrust-rods having adjustable terminals at their lower ends to reach and act upon the pedal-keys respectively.

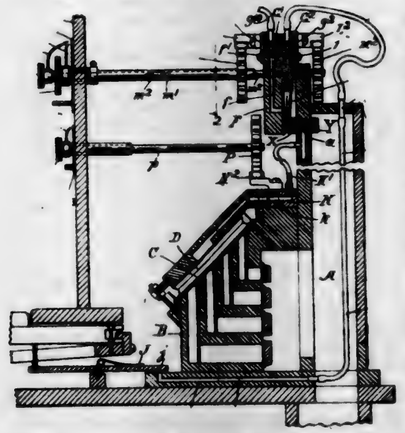
18. In an automatic player for an organ, a system of pneumatics for operating the manual-keys of the organ; a wind-chest from which they derive their air tension; means for supporting the player in adjustable relation to the manual of the organ, and a flexible tube connecting the wind-chest of the player and arranged to be connected to the wind-chest of the organ.

19. The combination, in an instrument having a horizontal bank of manual-keys, of an automatic player for the same, arranged to be located in front of the manual-breast, vertically-adjustable supports for such player on the instrument being provided, comprising a horizontal arm projecting from the frame of the player under the manual-breast of the instrument, and lodgment for such arm mounted on the instrument.

20. An automatic player for a manual-keyed instrument, arranged to be located in front of the manual-breast of the instrument with the means for operating upon the keys overhanging the same, and having a rigid arm or extension of its frame projected under the manual-breast, in combination with lodgments for such arm, securably and vertically adjustable on the case of the instrument to be played.

21. The combination with an instrument having a horizontal bank of manual-keys of an automatic player for the same arranged to be located in front of the manual-breast of the instrument and having a rigid arm or extension of its frame projected under the manual-breast, and lodgments for such arm secured and vertically adjustable on the case of the instrument.

709,968. **TRANSPOSING DEVICE FOR MUSICAL INSTRUMENTS.** MELVILLE CLARK, Chicago, Ill. Filed July 14, 1898. Renewed Feb. 14, 1901. Serial No. 47,353. (No model.)



Claim.—1. In a pneumatically-operated musical instrument, in combination with the pneumatics which control the sounding devices respectively, ducts leading from such pneumatics respectively, and ports to which said ducts lead; suitable means for controlling such ports and thereby controlling said ducts individually, thereby selecting the sounding device which is to be brought into action, said ducts all being disjoined or severed at a line transverse to their extent, abutting or adjusting bars having or supporting respectively the two disjoined portions of the ducts, such portions extending respectively to the pneumatics on the one hand and to the controlled ports on the other hand, one of said bars being movable and constructed and arranged to carry in its movement without severance thereof that portion of said ducts which is contained or supported by it, and means for moving such bar to shift the registration or connection of such ducts across the line of severance.

2. In an instrument having sounding devices, and motor devices and their connections for causing the sounding devices respectively to speak; pneumatics for controlling the motor devices; ducts from said pneumatics; valves controlling said ducts, and mechanical connections from the manual-keys for operating said valves respectively, said ducts each comprising two parts which terminate respectively in adjacent boards or bars, one of said parts extending to the pneumatic and the other part extending to the valve, one of said boards or bars being movable on the other carrying the terminals thereon without severance thereof from the parts of the ducts to which they respectively pertain to shift the registration of the terminal mouths of said ducts at the plane of contact, and suitable means for moving said movable board or bar at will.

3. In an instrument having sounding devices, and motor devices and their connections for causing the sounding devices to speak; pneumatics for controlling the motor devices, and ducts from said pneumatics to the tracker-range, said ducts each comprising two parts which terminate respectively in adjacent boards or bars, one of said boards or bars being movable on the other carrying the terminals thereon without severance thereof from the parts of the ducts to which they respectively pertain to shift the registration of the terminal mouths of said ducts at the plane of contact, and suitable means for moving said movable board or bar at will.

4. In an instrument having sounding devices, motor-pneumatics, and connections by which they cause the sound devices to speak; primary pneumatics, and valves by which they respectively control the motor-pneumatics; ducts leading from the primary pneumatics respectively, and ports to which said ducts lead and suitable means for controlling such ports and thereby controlling said ducts individually, and thereby selecting the sounding devices to be brought into action; said ducts being all disjoined or severed at a line transverse to their extent; abutting or adjusting bars having or supporting respectively the two disjoined portions of the ducts, such portions extending respectively to the primary pneumatics on the one hand and to the controlled ports on the other; one of said bars being movable, and constructed and arranged to carry in its movement, without severance thereof, the portion of said ducts contained or supported by it; and means for moving such bar to shift the registration or connection of such ducts across the line of severance.

5. In an instrument having sounding devices and motor devices and their connections for causing the sounding devices respectively to speak, pneumatics for controlling the sounding devices; ducts from the pneumatics, and valves for controlling said ducts; mechanical connections from the manual-keys for operating the valves respectively, the ducts each comprising two parts, one part extending to the pneumatics and the other part extending to the valve-seats, said parts terminating respectively in adjacent boards or bars, one of said boards or bars being movable on the other to shift the registration of the terminal mouths of said ducts at the plane of contact of the bars, the portions of said ducts pertaining to said movable bar being flexible tubes to permit such movement of the bar; and suitable means for moving the bar at will.

6. In an instrument having sounding devices and motor devices and their connections for causing the sounding devices to speak; pneumatics for controlling the motor devices, a tracker-range and ducts therefrom said pneumatics, said ducts each comprising two parts which terminate respectively in adjacent boards or bars, one of said boards or bars being movable on the other to shift the registration of the terminal mouths of said ducts at the plane of contact of the boards or bars; the portions of said ducts pertaining to said movable bar comprising tubes which are flexible to permit the movement of the bar without rupture or disconnection of the ducts, and suitable means for moving such movable board or bar at will.

7. In a pneumatically-operated musical instrument, in combination with the pneumatics which control the sounding devices respectively, ducts from said pneumatics respectively each provided with two branches; slides which respectively have apertures corresponding to said branches, and flexible tubes connected to said apertures, those thus connected to the apertures of one of said slides being arranged to afford communication with a tracker-range and adapted to be controlled by a perforated music-sheet thereat, and those connected to the other slide being arranged to afford communication with a valve-board and adapted to be controlled by the manual-keys respectively.

8. In a pneumatically-operated musical instrument, in combination with the pneumatics which control the sounding devices respectively, ducts from said pneumatics respectively each provided with two branches; slides which respectively have apertures corresponding to said branches, and flexible tubes connected to said apertures, those thus connected to the apertures of one of said slides being arranged to afford communication

with a tracker-range and adapted to be controlled by a perforated music-sheet thereat, and those connected to the other slide being arranged to afford communication with a valve-board and adapted to be controlled by the manual-keys respectively; mechanical devices for moving the slides respectively, and a graduated plate and index-finger to indicate the steps of such movement.

9. In a pneumatically-operated musical instrument, in combination with the pneumatics which control the sounding devices respectively, ducts from said pneumatics respectively, each provided with two branches; slides which respectively have apertures corresponding to said branches, and flexible tubes connected to said apertures, those thus connected to the apertures of one of said slides being arranged to afford communication with a tracker-range and adapted to be controlled by a perforated music-sheet thereat, and those connected to the other slide being arranged to afford communication with a valve-board and adapted to be controlled by the manual-keys respectively; said slides being provided with rack-bars; pinions engaging said rack-bars, respectively, having their shafts coaxial, one of said shafts being a sleeve on the other; index-fingers on said shafts, and a graduated dial-plate over which both said index-fingers move as the shafts are rotated.

10. In a musical instrument, in combination with the sounding devices, motor-pneumatics for causing the sounding devices to speak, and primary pneumatics to control the motor-pneumatics; ducts controlled by the primary pneumatics and leading to the motor-pneumatics and each comprising a flexible tube, a slide into which all said flexible tubes are connected; the apertures through said slide being adapted to register at the slide-seat with the continuations of the ducts respectively; and means for moving the slide in its seat to shift the registration of said ducts.

709,964. SHADE-ROLLER BRACKET. WILLIAM CLOWES and OTIS H. STEVENS, Hardwick, Vt.; said Stevens assignor to said Clowes. Filed June 26, 1902. Serial No. 113,257. (No model.)

Claim.—The combination with a base-plate provided with two holes and with a marginal laterally-projecting guide-flange, fastening means inserted through one of said holes, a bracket having an angular arm formed with a longitudinal slot the lower edge of said arm resting upon said guide-flange, and a set-screw extending through said slot and the unoccupied hole of the plate and adapted to prevent pivotal movement of the plate and to hold the bracket in longitudinal adjustment, substantially as set forth.

709,965. FOLDING BOX. FLORENCE CRESSER, East Liverpool, Ohio. Filed July 26, 1901. Serial No. 69,657. (No model.)

Claim.—A folding box comprising a bottom carrying cleats and ends, and a cover secured to one of said ends, said ends being formed with openings, and said sides carrying wings which overlap the vertical edges of the said ends, metallic straps attached to said wings and secured in the openings of the said ends, said cover carrying at its free end a depending wing, a handle secured to the box at one of its ends, and having its free end extending through openings in the cover and the flap thereof, and a band secured to the end of the box adjacent the said top flap, said band and said handle being tied together, substantially as and for the purpose specified.

709,966. CARBONIZING APPARATUS. GEORGE W. CURTIS, Peoria, Ill., assignor to Morrow Protective Process Company, a Corporation of Illinois. Filed Nov. 30, 1901. Serial No. 84,273. (No model.)

Claim.—1. In an apparatus for carbonizing ink on paper, the combination with a casing having a heating-chamber and insertion and discharge apertures, of means for heating said chamber, a support within the heating-chamber for the paper carrying the lines of writing to be carbonized, a gate or door closing the discharge-aperture, and an operating device having a predetermined time movement to automatically tilt the support and open the door at a definite interval after starting, whereby the carbonization of the lines of writing is timed, by inserting the paper into the heating-chamber before or after the starting of the operating device, substantially as set forth.

2. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and insertion and discharge apertures, means for heating said chamber, a tilting tray or rack arranged within said chamber for supporting the paper carrying the lines of writing to be carbonized, a door closing the discharge-aperture and carrying a contact-piece, a rock-shaft for tilting the tray, and means for simultaneously operating the rock-shaft to tilt the tray and engaging said contact-piece to open the door to allow the paper to discharge, substantially as set forth.

3. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and insertion and discharge apertures, means for heating said chamber, a tilting tray or rack arranged within said chamber for supporting the paper carrying the lines of writing to be carbonized, a door closing the discharge-aperture and carrying a contact-piece, a rock-shaft for tilting the tray, a cam carried by the rock-shaft for engaging said contact-piece to open the door, and means for operating the rock-shaft, substantially as set forth.

4. In an apparatus for carbonizing ink on paper, the combination with a casing having a heating-chamber and insertion and discharge apertures, of means for heating said chamber, a tilting tray or rack arranged within said chamber for supporting the paper carrying the lines of writing to be carbonized, a door closing the discharge-aperture and carrying a contact-piece, a rock-shaft for tilting the tray, means for simultaneously operating the rock-shaft to tilt the tray and engaging said contact-piece to open the door, and further means having a predetermined time movement to actuate the means first named to tilt the rack or tray and open the door at a definite interval after starting, whereby the carbonization of the lines of writing is timed, by inserting the paper into the heating-chamber before or after the starting of the operating means, substantially as set forth.

5. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and insertion and discharge apertures, means for heating said chamber, a tilting tray or rack arranged within said chamber for supporting the paper carrying the lines of writing to be carbonized, a door closing the discharge-aperture and carrying a contact-piece, a rock-shaft for tilting the tray, means for simultaneously operating the rock-shaft to tilt the tray and engaging said contact-piece to open the door, a cam for operating the means first named, and a spring-motor for automatically operating the cam, and a stop device for starting and stopping said spring-motor, substantially as set forth.

6. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, a device within the chamber for supporting the paper carrying the lines of writing to be carbonized, said device having comparatively thin-spaced linear strands forming an open-work surface for the paper to rest upon, and means for actuating said device for discharging the paper through said aperture, substantially as described.

7. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, a support within the chamber for the paper carrying the lines of writing to be carbonized, and a rock-shaft connected to the support at one of its edges and adapted to be positively turned to tilt the support to discharge the paper through said aperture, the portion of the support contiguous to the shaft being shaped to form a surface devoid of crevices or projections in which the paper may hang or lodge as it slides off the support, substantially as set forth.

8. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber provided at its top with a transparent panel and discharge-aperture for the heated air, one of which apertures serves as an inlet for the insertion of the paper carrying the lines of writing to be carbonized, said casing also having a discharge-aperture at the base of the heating-chamber, a gate or door closing said aperture, a tilting tray or rack to support the paper, a heating device located in the base of the casing for heating said chamber, a spreader or deflector located between the heater and tray for equably distributing the heat and conducting the heated air to opposite sides of the chamber, and means for simultaneously tilting the tray and opening the door to discharge the paper through said discharge-aperture, substantially as set forth.

9. In an apparatus for carbonizing ink on paper, a casing having a heating-chamber, a heating device below said chamber, a spreader above the heater for equalizing the distribution of heat to the chamber, and a tilting tray above the deflector for supporting the paper carrying the lines of writing to be carbonized, substantially as set forth.

10. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, means for heating said chamber, a foraminous or open-work support within the heating-chamber for the paper carrying the lines of writing to be carbonized, and means for actuating said support to discharge the paper through said aperture, substantially as set forth.

11. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber, and a discharge-aperture, means for heating said chamber, a support within the heating-chamber for the paper carrying the lines of writing to be carbonized, a gate or door closing the discharge-aperture, and means counting between the support and gate whereby said support and gate may be simultaneously and positively tilted and opened to discharge the paper, substantially as specified.

12. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, means for heating said chamber, a support within the heating-chamber for the paper carrying the lines of writing to be carbonized, a gate or door closing the discharge-aperture, and an operating device engaging the support and gate for simultaneously tilting the support and opening the gate to discharge the paper, substantially as set forth.

13. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, means for heating said chamber, a support within the casing for the paper carrying the lines of writing to be carbonized, means for normally sustaining the support in a fixed position relative to the casing and contiguous to the aperture, and an exterior operating device for temporarily inclining the support to discharge the paper after the lines thereon have been carbonized, substantially as described.

14. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, means for heating said chamber, a support within the chamber for the paper carrying the lines of writing to be carbonized, said support being in a position contiguous to the aperture, and means projecting to and operable from the exterior of the chamber for actuating the support to discharge the paper through said aperture, substantially as specified.

15. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber and a discharge-aperture, means for heating said chamber, a tilting support within the chamber for the lines of writing to be carbonized, said support having a fixed axis, means for tilting said support, said means being connected to said support and insertible and removable therewith through the discharge-aperture, substantially as set forth.

16. An apparatus for carbonizing written or printed matter upon paper embodying a heating-chamber and means for heating the same, in combination with a support for the paper, and means adapted to be operated from the exterior of the casing for actuating said support to discharge the paper, substantially as described.

17. In an apparatus for carbonizing ink on paper, the combination of a casing having a heating-chamber provided at its top with a transparent panel and discharge-aperture for the heated air, one of which apertures serves as an inlet for the insertion of the paper carrying the lines of writing to be carbonized, said casing also having a discharge aperture at the base of the heating-chamber, a gate or door closing said aperture, a tilting tray or rack to support the paper, means for heating the chamber, and means for simultaneously tilting the tray and opening the door to discharge the paper through said discharge-aperture, substantially as set forth.

18. In an apparatus for carbonizing ink on paper, the combination of a heating-chamber provided at its top with a transparent panel and vent-apertures for the heated air, one of which apertures serves as an inlet for the insertion of the paper carrying the lines of writing to be carbonized, said casing also having a discharge-aperture for the paper at or near the base thereof, a support within the casing for the paper carrying the lines of writing to be carbonized, and means for actuating said support for discharging the paper through said discharge-aperture, substantially as specified.

709,967. CARBONIZING APPARATUS. GEORGE W. CURTIS, Peoria, Ill., assignor to Morrow Protective Process Company, a Corporation of Illinois. Filed Nov. 30, 1901. Serial No. 84,274. (No model.)

Claim.—1. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, a tray within the chamber and movable to register with said apertures, a gate or valve closing the feed-aperture, means for moving the tray, and means carried by the tray for opening said gate or valve as the tray moves into register with the feed-aperture, substantially as set forth.

2. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, a tray within the chamber and movable to register with said apertures, a gate or valve closing the feed-aperture, means for moving the tray, and a cam carried by the tray for opening said gate or valve as the tray moves into register with the feed-aperture, substantially as set forth.

3. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, a tray within the chamber and movable to register with said apertures, a gate or valve closing the feed-aperture, means for moving the tray, and a cam carried by the tray for opening said gate or valve as the tray moves into register with the feed-aperture, said cam being so constructed as to effect the quick opening and gradual closing of the valve, substantially as set forth.

4. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, a rotary tray within the chamber and movable to come in register with said apertures, a gate or valve closing the feed-aperture, means for rotating the tray, a rock-shaft carrying the valve and provided with an arm, and a cam upon the tray for engaging said arm to rock the shaft and open the valve as the tray moves into register with the feed-aperture, substantially as set forth.

5. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, a rotary tray within the chamber and movable to come in register with said apertures, a gate or valve closing the feed-aperture, means for rotating the tray, a rock-shaft carrying the valve and provided with an arm, a cam upon the tray for engaging said arm to rock the shaft and open the valve, and a stop device for engaging said cam to arrest the motion of the tray, substantially as set forth.

6. In an apparatus for carbonizing ink on paper, the combination of a heating-chamber provided with feed and discharge apertures, a rotary tray within the chamber and movable to come in register with said apertures, a gate or valve closing the feed-aperture, means for rotating the tray, a stop-lug projectable into the path of the tray to arrest the motion thereof, a rock-shaft carrying said lug, and means for maintaining the rock-shaft and lug in adjusted position, substantially as set forth.

7. In an apparatus for carbonizing ink on paper, the combination of a heating-chamber provided with feed and discharge apertures, means for

heating said chamber, a tray movable within the chamber to register with said apertures, means for moving the tray, a gate or valve closing the feed-aperture, a rock-shaft carrying said valve, a cam upon the tray for actuating said rock-shaft, a lug projectable into the path of the cam to arrest the motion of the tray, a rock-shaft for actuating said lug, and means for maintaining the lug in adjusted position, substantially as set forth.

8. In a device for carbonizing ink on paper, the combination of a heating-chamber provided with feed and discharge apertures, means for heating said chamber, a shaft, end pieces upon the shaft, slats connected to the end pieces, a series of V-shaped arms connected to the slats and forming a tray or pocket for the reception of the paper carrying the lines of writing to be carbonized, means for clamping the vertex portions of the arms to the shaft, and means for rotating said shaft, substantially as set forth.

9. In a device for carbonizing ink on paper, the combination of a heating-chamber provided with feed and discharge apertures, means for heating said chamber, a shaft, end pieces upon the shaft, slats connected to the end pieces, a series of V-shaped arms connected to the slats and forming a tray or pocket for the reception of the paper carrying the lines of writing to be carbonized, collars on the shaft between the arms, means for forcing the collars toward each other to clamp the vertex portions of the arms to the shaft, and means for rotating said shaft, substantially as set forth.

10. A portable apparatus for carbonizing ink on paper comprising a supporting-base having a heater arranged therein, a casing mounted upon the base and having inlet and discharge apertures, a drum arranged within the base, heads closing the ends of the cylinder, a wheel rotatably supported by the heads and provided with pockets to receive the papers carrying the lines of writing to be carbonized, and means for operating the wheel, substantially as specified.

11. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, means for heating said chamber, a rotary wheel mounted within the chamber and provided with a series of trays or pockets for receiving the papers carrying the lines of writing to be carbonized from said feed-aperture and moving the same through the heated chamber to the discharge-aperture, a gate or valve closing the feed-aperture, cams upon the wheel for automatically opening said valve as each tray or pocket moves into receiving position, and means for operating said wheel, substantially as set forth.

12. A portable apparatus for carbonizing ink on paper comprising a heating-chamber provided with feed and discharge apertures, means for heating said chamber, a rotary wheel mounted within the chamber and provided with a series of trays or pockets for receiving the papers carrying the lines of writing to be carbonized from said feed-aperture and moving the same through the heated chamber to the discharge-aperture, means for opening the valve as each tray or pocket moves into receiving position, means for engaging the wheel to arrest the motion thereof, and means for operating said wheel, substantially as set forth.

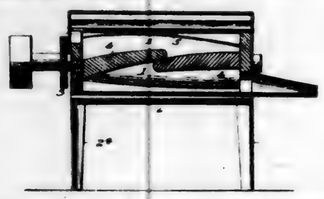
13. In a device for carbonizing ink on paper, the combination of a heating-chamber provided with feed and discharge apertures, a shaft arranged therein, disks mounted upon the shaft, slats connected to said disks, rows of metallic V-shaped arms having their vertex portions bearing on the shaft and their free ends connected to the slats, forming a series of trays or pockets, collars about the shaft between the arms, fastening devices for forcing said collars toward each other to clamp the arms to the shaft, and means for rotating the shaft, substantially as set forth.

14. A portable apparatus for carbonizing ink on paper comprising a base having a heating device arranged therein, a casing supported by and in communication with the base, a drum arranged within the casing and in communication therewith, said casing and drum being provided with hot-air inlets and outlets and feed and discharge apertures for the papers carrying the lines of writing to be carbonized, a wheel arranged within the drum and provided with a series of trays or pockets, and means for rotating said wheel, substantially as set forth.

15. In an apparatus for carbonizing ink on paper, the combination, with a casing provided with vent-openings, of a drum therein and spaced therefrom, the space suitably partitioned to form inlet and outlet spaces for heated air, said spaces being in communication with the casing and the casing and drum provided with feed and discharge apertures, means for supplying heated air to the inlet-space, a tray movable within the drum to register with said apertures, and means for moving the tray, substantially as set forth.

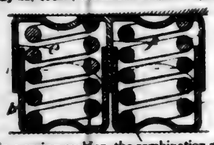
16. In an apparatus for carbonizing ink on paper, the combination, with a casing provided with vent-openings, of a drum therein and spaced therefrom, the space suitably partitioned to form inlet and outlet spaces for heated air, said spaces being in communication with the casing and the casing and drum provided with feed and discharge apertures, means for supplying heated air to the inlet-space, a rotary wheel mounted within the drum and provided with a series of trays or pockets for receiving the papers carrying the lines of writing to be carbonized from said feed-aperture and moving the same through the drum to the discharge-aperture, and means for operating said wheel, substantially as set forth.

709,968. AIR-PUMP. CHARLES M. DAY, Maltabend, Mo., assignor of one-half to Milton W. Walker, Maltabend, Mo. Filed Apr. 10, 1900. Serial No. 12,366. (No model.)



Claim.—In a device of the character described, the combination of a closure or casing and twin screws or worms, arranged in said closure, said casing or closure having an air-inlet in one side, and one end, and a blast-outlet in its other end and at or near its other side, substantially as set forth.

709,969. SPRING-CUSHION. EDWARD DENEGRE, Chicago, Ill., assignor to McCord & Company, Chicago, Ill., a Corporation of New Jersey. Filed May 22, 1902. Serial No. 108,551. (No model.)



Claim.—1. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element upon the exterior of the coiled spring formed of resilient spring metal and moving with one of the parts to be cushioned, and a rigid friction element moving with the other part to be cushioned, substantially as described.

2. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element upon the exterior of the coiled spring formed of resilient spring metal and moving with one of the parts to be cushioned, and a rigid friction element moving with the other part to be cushioned, the first aforesaid friction element being in the form of a cap-plate inclosing the coiled spring, substantially as described.

3. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element upon the exterior of the coiled spring formed of resilient spring metal and moving with one of the parts to be cushioned, and a rigid friction element moving with the other part to be cushioned, the second aforesaid friction element being in the form of a cap-plate inclosing the coiled spring, substantially as described.

4. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element upon the exterior of the coiled spring formed of resilient spring metal and moving with one of the parts to be cushioned, and a rigid friction element moving with the other part to be cushioned, the first friction element being in the form of a flexible cap-plate, while the second friction element is in the form of a rigid cap-plate, substantially as described.

5. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element upon the exterior of the coiled spring formed of resilient spring metal and moving with one of the parts to be cushioned, and a rigid friction element moving with the other part to be cushioned, the first friction element being in the form of a flexible cap-plate while the second friction element is in the form of a rigid cap-plate, the rigid cap-plate inclosing the flexible cap-plate, substantially as described.

6. The combination with a plurality of coiled springs interposed between the parts to be cushioned, of a plurality of flexible cap-plates moving with one of the parts to be cushioned, structurally distinct from each other and formed of spring metal to thereby secure friction, and a plurality of cap-plates formed in a single unitary structure with which the flexible cap-plates have frictional engagement and having side walls *e*, *e* and webs *f*, *f* affording pockets for receiving the coiled springs, substantially as described.

7. The combination with a plurality of coiled springs interposed between the parts to be cushioned, of a plurality of flexible cap-plates moving with one of the parts to be cushioned, structurally distinct from each other and formed of spring metal to thereby secure friction, and a plurality of rigid cap-plates formed in a single unitary structure with which the aforesaid cap-plates have frictional engagement and having side walls *e*, *e* and webs *f*, *f* affording pockets for receiving the coiled springs, substantially as described.

8. The combination with a plurality of coiled springs interposed between the parts to be cushioned, of a plurality of flexible cap-plates moving with one of the parts to be cushioned, structurally distinct from each other and formed of spring metal to thereby secure friction, and a plurality of cap-plates formed in a single unitary structure with which the flexible cap-plates have frictional engagement, and having side walls *e*, *e* and webs *f*, *f* affording pockets for receiving the coiled springs, the first aforesaid cap-plates being inclosed by the second aforesaid cap-plates, substantially as described.

9. The combination with a plurality of coiled springs interposed between the parts to be cushioned, of a plurality of flexible cap-plates moving with one of the parts to be cushioned, structurally distinct from each other and formed of spring metal to thereby secure friction, and a plurality of rigid cap-plates formed in a single unitary structure with which the aforesaid cap plates have frictional engagement, and having side walls *e*, *e* and webs *f*, *f* affording pockets for receiving the coiled springs, the first aforesaid cap-plates being inclosed by the second aforesaid cap-plates, substantially as described.

709,970. GARMENT-HOLDER. NATHAN DOUGLAS, Cambridge, Mass. Filed Jan. 23, 1902. Serial No. 90,896. (No model.)

Claim.—1. A garment-holder comprising a body portion, a pair of separated engaging projections in proximity to each end of said body portion, and adjacent portions in connection with each of the engaging projections lying between the same and providing a practically continuous stop-face of at least double the width of each of said engaging projections.

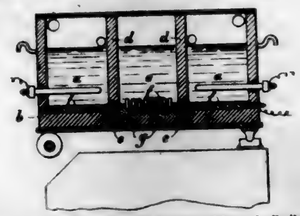
2. A garment-holder comprising a body portion, a pair of separated engaging projections in proximity to each end of said body portion, and adjacent portions in connection with each of the engaging projections occupying substantially the entire width between the same and providing a practically continuous stop-face of at least double the width of each of said engaging projections.

3. A garment-holder comprising a body portion, a plurality of separated engaging projections in proximity to each end of said body portion, and a coil connecting the body portion with each of the engaging projections, said coils lying closely adjacent to one another.

4. A garment-holder comprising a body portion, a plurality of separated engaging projections in proximity to each end of said body portion, and a coil connecting the body portion with each of the engaging projections, said coils lying closely adjacent to one another and having their inner side closing the space between the body portion and the engaging projections.

5. A garment-holder comprising a body portion, a pair of separated engaging projections in proximity to each end of said body portion, and a coil connecting the body portion with each engaging projection, said coils lying between the engaging projections and closely adjacent to one another.

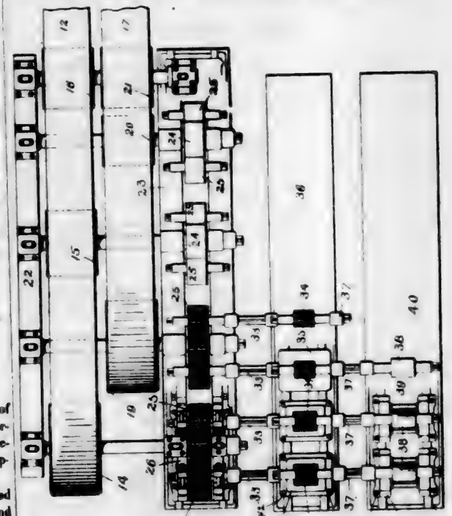
709,971. ELECTROLYTIC DECOMPOSITION OF ALKALINE SALTS. EDWIN ESSER and MEYER WILDERMANN, London, England. Filed Mar. 28, 1901. Serial No. 53,276. (No specimens.)



Claim.—1. In the electrolytic decomposition of alkaline salts, the herein-described process of increasing the speed with which alkaline metal existing as amalgam combines with water which consists in applying to pieces of carbon a conductive material independent of the amalgam, and then placing of said carbon pieces in contact with the amalgam, substantially as described.

2. In the electrolytic decomposition of alkaline salts, the process of increasing the speed with which alkaline metal existing as amalgam combines with water, consisting in placing small pieces of a combination of carbon and metal filings on the amalgam, substantially as described.

709,972. ROLLING-MILL. VICTOR E. EDWARDS, Worcester, Mass. Filed Aug. 8, 1900. Serial No. 26,258. (No model.)



Claim.—1. The combination of a continuous rolling-mill comprising a plurality of sets of rolls, driving connections, and means for coupling the rolls with different members of the driving connections, so that successive sets of rolls may be driven at different relative speed ratios to adapt the rolling-mill to the production of different products.

2. In a continuous rolling-mill, the combination of a bed plate or frame, roll-stands adjustably mounted thereon, and driving connections having spindles turning at different relative speeds, said parts being arranged so that the rolls may be coupled to and driven from different sets of spindles to adapt the rolling-mill to the production of a variety of products.

3. In a continuous rolling-mill, the combination of a bed plate or frame, roll-stands adjustably mounted thereon, and driving connections having pinion-housings adjustably mounted thereon, and driving connections having shafts turning at different relative speeds, said parts being arranged so that by adjusting the roll-stands and pinion-housings the rolls may be driven from different sets of shafts to adapt the rolling-mill to the production of a variety of products.

4. The combination of a set of primary shafts, a set of secondary shafts geared to turn at different speeds from the primary shafts, and a continuous rolling-mill arranged so that its roll-stands may be adjusted to have the rolls thereof driven from either the primary or secondary set of shafts, as desired.

5. The combination of a set of primary shafts, a set of secondary shafts arranged below and geared to turn at different speeds from the primary shafts, a continuous rolling-mill and driving-pinions therefor arranged so that the upper pinions may be driven from the primary shafts or the lower pinions driven from the secondary shafts, as desired.

6. In a continuous rolling-mill, the combination of a bed plate or frame, roll-stands adjustably mounted thereon, a second bed plate or frame having pinion-housings adjustably mounted thereon, a primary set of driving-shafts, and a secondary set of driving-shafts geared to turn at different speeds from the primary shafts, said parts being arranged so that the rolls may be coupled to and driven either from the primary or secondary set of shafts, as desired.

7. The combination of a set of primary shafts, a pulley, belts for driving the shafts from said pulley, a set of secondary shafts geared to turn at different speeds from the primary shafts, and a continuous rolling-mill arranged so that its roll-stands may be relocated to have its rolls driven from either the primary or secondary set of shafts, as desired.

8. The combination of gears for turning the rolls of a continuous

rolling-mill, gear-housings therefor, consisting of side plates, each of which has a main box or center bearing, and a tapering split socket at each side thereof, tapered flanged boxes fitting into said sockets, bolts extending through the flanges of the boxes, and clamping-bolts for clamping said boxes in place, substantially as described.

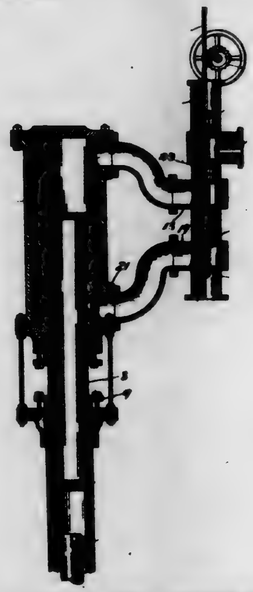
709,973. DENTAL APPARATUS. LOUIS BELESTEN, Paris, France. Filed Feb. 25, 1901. Serial No. 48,881. (No model.)

Claim.—1. The combination with the two denture-plates and securing-hooks secured thereto, of a coiled spring, and small disks secured to the ends of the spring and provided with notches in which the securing-hooks are adapted to engage.

2. The combination with the two denture-plates and tubes secured therein and securing-hooks carried by said plates, of a coiled spring, small disks secured to the ends thereof and provided each with a notch within which the securing-hooks engage, and pins secured to the disks and entering the tubes in the plates.

3. A coiled spring for use as described, provided with securing-disks at its ends, and antiseptic soft rubber between the windings of the spring.

709,974. ELEVATOR. CHARLES R. BEERS, Chicago, Ill., assignor of one-half to Joseph Rice, Chicago, Ill. Filed Feb. 3, 1901. Serial No. 45,680. (No model.)



Claim.—An elevator comprising an elevator-plunger, an elevator-cylinder surrounding, and of greater internal diameter than, the elevator-plunger, having a stuffing-box, a receiving-cylinder of greater internal diameter than the elevator-cylinder, having a stuffing-box of the same internal diameter as the stuffing-box of the elevator-cylinder, a high-pressure plunger of the same diameter as the internal diameter of the elevator-cylinder and working through the stuffing-boxes and in both the elevator-cylinder and receiving-cylinder, having a piston of the internal diameter of and working in the receiving-cylinder, a valve-housing having inlet, outlet and intermediate ports, the ports connecting the receiving-cylinder, at opposite sides of the piston with the intermediate ports, a balance piston-valve having four pistons for controlling the ports in the valve-casing and means for operating the piston-valve so that the pressure may be admitted to the outer end of the receiving-cylinder for forcing the piston of the latter inward while permitting the liquid on the inner side of the piston of the receiving-cylinder to escape, and for placing the ports of the receiving-cylinder in communication through the intermediate ports of the valve-casing, substantially as set forth.

709,975. RAILWAY-TRACK STRUCTURE. EDWARD B. ENTWISLE, Johnstown, Pa., assignor to the Lorain Steel Company, a Corporation of Pennsylvania. Filed Feb. 8, 1902. Serial No. 93,229. (No model.)

Claim.—1. In a switch mate, a body portion formed of cast metal, rail members extending therefrom for connection with the adjacent track-rails, a guard-rail secured to one side of said body portion, and a hard-metal track-surfaced plate seated on said body portion between a flange thereof and the said guard-rail.

2. In a switch mate, a body portion of cast metal having an upwardly-extending flange at one side, a guard-rail secured to the opposite side of said body portion, and a hard-metal track-surfaced plate seated between said flange and guard-rail.

3. In a switch mate, a body portion of cast metal having an upwardly-extending flange at one side, a guard-rail removably secured to the opposite side of said body portion, and a hard-metal track-surfaced plate seated between said flange and guard-rail.

4. The herein-described switch mate, consisting of the body A of cast metal, having the side flange a, the rail members cast into said body portion, the guard-rail secured thereto, and the hard-metal track-surfaced plate seated between the said flange and the guard-rail, and provided with a lip which fits under the head of the said rail.

5. A track structure, consisting of a body of cast metal having rail-member extensions for connection with the adjacent rails of main and branch tracks, a guard-rail removably secured to one side of said body, and a hardened track-surfaced plate whose ends abut the inner ends of said extensions, and which is seated in a recess or pocket, one wall of which is formed by the removable guard-rail.

709,976. LAWN-TRIMMING IMPLEMENT. CHARLES PERSTROM, Chicago, Ill. Filed Sept. 12, 1901. Serial No. 75,189. (No model.)

Claim.—1. A lawn-trimming implement comprising a trough-shaped head adapted to cut into the sod, a guide adapted to rest upon the sidewalk and the like, to control the depth of furrow, and a handle suitably secured to said head.

2. A device for trimming lawns adjacent to sidewalks and the like, comprising substantially a head having sharpened cutting edges adapted to cut a narrow furrow, and a guide adapted to rest upon the sidewalk and control the depth of furrow.

3. A device for trimming lawns adjacent to sidewalks, comprising substantially a head having the sides, a, a', and connecting-bottom, a^2, sharpened upon their forward edges, and adapted to cut into the sod to produce a narrow furrow, a flange, a', extending outward from the side a, and adapted to rest upon the sidewalk to guide the device in its movement with respect thereto, and a handle suitably secured to said head.

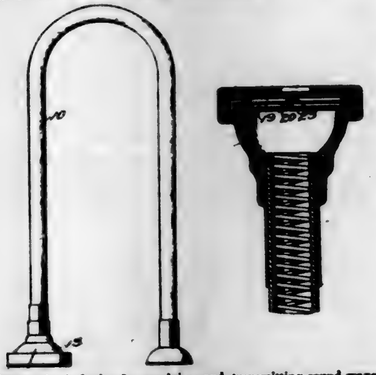
709,977. PNEUMATIC CUSHION. JOHN H. PERRET, Chicago, Ill., assignor of one-half to David G. Stearns, Chicago, Ill. Filed Sept. 26, 1901. Serial No. 76,079. (No model.)

Claim.—1. A tie-hub for cushions comprising a body portion having a fixed flange, of a clamping-washer, a wedge-key piercing said body for adjusting the clamping-washer thereon, and a triangular bail pivoted upon the body aforesaid adapted to receive at its centrally-located swinging apex a cushion tie-band, substantially as described.

2. A tie-hub for cushions comprising a body portion, a fixed flange and an adjustable clamping-washer said flange and washer having opposing concave faces, of a wedge-key piercing said body for adjusting the clamping-washer thereon, and a triangular self-centering bail pivoted upon the body aforesaid adapted to receive at its swinging apex a cushion tie-band, substantially as described.

3. In a cushion the combination with oppositely-arranged tie-hubs each having a body portion, a screw-cap, a fixed flange and an adjustable clamping-washer, said cap, flange, and washer having opposing concave faces between which portions of the cushion are secured; of a triangular self-centering bail pivoted upon each body portion aforesaid, and a flexible tie-band connecting said bails by their swinging apexes, substantially as described.

709,978. AURIPHONE. FRANK I. GANS, Anaconda, Mont. Filed May 8, 1902. Serial No. 106,656. (No model.)



Claim.—1. A device for receiving and transmitting sound-waves, comprising a box or casing having inlet and outlet openings, a pair of rigidly-confined imperforate diaphragms spaced to form an air-chamber, and a centrally-disposed cone carried by one of said diaphragms and disconnected from but adapted for contact with the other diaphragm.

2. An acoustic appliance comprising a box or casing having inlet and outlet openings, a pair of separated imperforate diaphragms arranged to form an intervening air-space, and a centrally-disposed block carried by one diaphragm and disconnected from but disposed in contact with the other diaphragm.

3. An acoustic appliance comprising a box or casing having inlet and outlet openings, a pair of separated imperforate diaphragms, means for clamping and holding the edge portions of said diaphragms, and a block carried by one of the diaphragms, said block being of a height slightly greater than the space between the edge portions of the diaphragms.

4. An acoustic appliance comprising a box or casing having inlet and outlet openings and provided with a flange or shoulder, an outer imperforate diaphragm seated on the flange or shoulder and separated from the adjacent wall of the box or casing by an air-chamber, a clamping-ring for holding the diaphragm against the flange, a second imperforate diaphragm mounted on the ring and having a centrally-disposed cone disconnected from but adapted for contact with the central portion of the outer diaphragm, and means for confining the diaphragms and ring in place.

5. An acoustic appliance comprising a box or casing having inlet and outlet openings, a flange within the same, an outer diaphragm mounted on said flange, a spacing-ring engaging the opposite face of said diaphragm, a second diaphragm mounted on the spacing-ring, a clamping-ring mounted on the second diaphragm, means for engaging the clamping-ring to firmly hold the diaphragms and ring in position, and a pair of cones mounted centrally on the opposite faces of the second diaphragm, either of said cones being movable to a position in contact with the central portion of the outer diaphragm.

6. In an acoustic appliance, the combination of the sectional box or casing having a threaded connection between the sections, a flange or shoulder formed within one of said sections, an outer imperforate diaphragm mounted on said flange or shoulder, a spacing-ring mounted on the imperforate diaphragm, a second diaphragm mounted on the spacing-ring, a clamping-ring arranged in contact with said diaphragm and adapted to be engaged and clamped in place by a portion of the box or casing, and a cone secured to the central portion of the second diaphragm and in engagement with the outer diaphragm, the height of said cone being greater than the thickness of the spacing-ring.

709,979. FUSE-IGNITING TAPE. JULIUS H. GARDIN, Denver, Colo., assignor of one-half to David H. Foreman and William C. Beans, Denver, Colo. Filed Nov. 11, 1901. Serial No. 82,071. (No model.)

Claim.—1. As an improved article of manufacture, an igniting device composed of a strip of material folded to form a flat tape, said device having a fragile igniting-line whereby perfect contact of the same with the powder core, may be effected by inserting the flat igniting-tape in the split end of the blasting-fuse.

2. As an improved article of manufacture, a fuse-igniting tape, composed of a ribbon of suitable material, coated with a readily-inflammable substance, and folded longitudinally and fastened in the folded position, substantially as described.

3. As an improved article of manufacture, a fuse-igniting tape, composed of a ribbon or strip of suitable material coated upon one side with a suitable readily-inflammable compound, folded inwardly from the edge by a succession of longitudinal folds and fixed in the folded position, forming an igniting-tape having a fragile igniting-line longitudinally disposed thereon.

4. As an improved article of manufacture, a fuse-igniting tape, composed of a ribbon of suitable material coated with an explosive substance or compound, and folded longitudinally, and suitably fixed, forming an inflammable tape the same being coated to render the fabric impervious to water.

5. A fuse-igniting tape, composed of a strip of material coated with an explosive substance, and folded to form a fragile fuse-igniting line, longitudinally disposed for the purpose set forth.

6. A fuse-igniting tape constructed of suitable material and of a length to be attached to a plurality of blasting-fuses, whereby all of the fuses may be lighted from a single ignition of the tape, the said tape being formed from a strip of suitable material coated with an inflammable substance and folded.

7. A fuse-igniting tape having a fragile, readily-inflammable igniting-line, longitudinally disposed thereon for the purpose set forth.

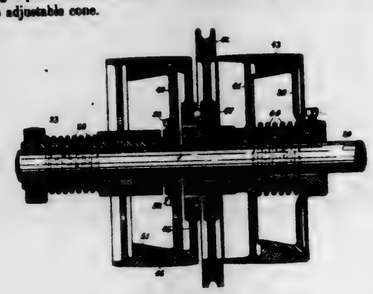
8. A fuse-igniting tape formed from a strip of material coated on its inner surface with an inflammable or explosive substance, and its exterior surface with a substance adapted to prevent injury from moisture, the said strip being folded, substantially as described and for the purpose set forth.

9. A fuse-igniting tape composed of a strip of suitable material coated with an inflammable substance and folded to form a number of loose layers permitting circulation of air to facilitate the travel of the fire, substantially as described.

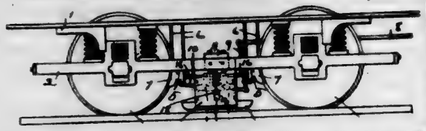
10. A flat, inflammable, fuse-igniting tape having fragile igniting-lines disposed upon the edges thereof, substantially as described.

709,980. GARDING-MACHINE. ERNEST GELLAIR, Lauenburg, Germany. Filed Feb. 4, 1901. Serial No. 46,917. (No model.)

Claim.—A differential friction-clutch for imparting alternately different velocities to a cleaning-roller of a carding-machine comprising one fixed friction-cone upon the shaft of the cleaning-roller, a friction-band on the face of said cone, a belt-pulley and a rope-pulley sliding and rotating upon the hub of said friction-cone, a concentric ball-race in the web of said rope-pulley, a conical rim on the inner side of said belt-pulley suitable to engage with the friction-band of said cone, a spring between the webs of said pulley and said friction-cone tending to separate them, an adjustable friction-cone, a friction-band on the face of said adjustable cone, a pulley sliding and rotating on the hub of said adjustable cone, a ring fixed in the rim of said pulley having a concentric groove comprising a shallow and a deeper portion, a friction-ball running alternately in said shallow portion or in the deeper portion of said groove in connection with the ball-race of the rope-pulley, a set-collar on the adjustable cone, a spring between the set-collar and the hub of the belt-pulley provided with the ring containing the groove with the shallow and deeper portions, said spring tending to press the conical rim of said belt-pulley upon the friction-band of the adjustable cone.

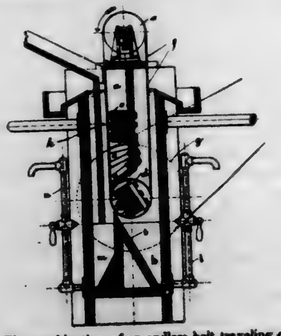


709,981. CAR-BRAKE. GEORGE M. GRIGGS, Scottdale, Pa. Filed Sept. 3, 1901. Serial No. 74,100. (No model.)



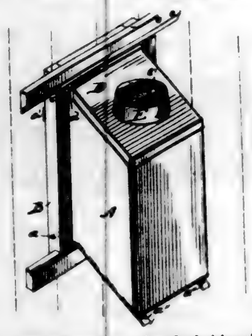
Claim.—The combination with the brake-beams having shoes at each end and adapted to engage the wheels, and means of forcing said shoe-carrying beams toward the wheels, of a frame arranged at each side of the track between the wheels, a pair of cams pivoted in each of said frames, rods connecting said cams with said brake-beams, a block suspended in each frame by a spring to cause engagement with said cams, and a rail braking-shoe carried by each of said blocks, as shown and set forth.

709,982. APPARATUS FOR SEPARATING MAGNETIC AND NON-MAGNETIC MATERIALS FROM ONE ANOTHER. JOSEF W. R. T. HEBERLE, Sala, Sweden. Filed Dec. 28, 1897. Serial No. 664,097. (No model.)



Claim.—The combination, of an endless belt traveling over pulleys in such a manner that one of its free sides moves downward vertically, a system of magnets inside said belt, a tank in which said belts and magnets are immersed, a vertical partition between the downward-moving part of the belt and the wall of said tank, another partition extending from the bottom of the tank and the lower pulley close to the same, and inlets and outlets for the water from said tank, substantially as and for the purpose set forth.

709,988. GARBAGE-RECEPTACLE. FREDERICK H. HOLSHAUER, Detroit, Mich. Filed Mar. 12, 1902. Serial No. 97,845. (No model.)

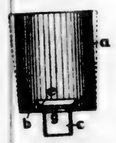


Claim.—1. In a garbage-receptacle, a deodorizing-chamber, secured to said cover, a wall for dividing said chamber into two compartments one of said compartments adapted to support a liquid deodorizer, absorbent material located within the other compartment and means whereby the removal of the cover will project a small quantity of the liquid deodorizer onto the absorbent material, substantially as described.

2. In a garbage-receptacle, a hinged cover, a receptacle for a liquid deodorizer mounted on said cover, a chamber adapted to support absorbent material and communicating with the garbage-receptacle, a suitable absorbent located within said chamber, communicating means between the liquid-chamber and that containing the absorbent material whereby when the cover is raised a portion of the liquid will be projected upon the absorbent material, substantially as described.

3. In a garbage-receptacle, a hinged cover, a deodorizing-chamber mounted on said cover, a dividing-wall located within said deodorizing-chamber, a spout mounted in said wall to provide a passage between the compartments, one of said compartments adapted to receive a liquid deodorizer, the other to support cotton-batting or other absorbent material, a grating adapted to serve as a support for the absorbent material and afford communication between said compartments and the garbage-chamber, substantially as described.

709,984. RESONATOR OR AMPLIFIER FOR PHONOGRAPHS. WILLIAM S. HOW, London, England, assignor of one-half to George Lindsay Johnson, London, England. Filed Mar. 1, 1901. Serial No. 49,476. (No model.)



Claim.—1. In a resonator or amplifier for phonographs and the like the combination of a tube *a* having a flat bottom *b* and a cylindrical neck *c* with one or more cup-shaped modulators *d e* having apertures *f g* in the bottom thereof all substantially as specified for the purpose stated.

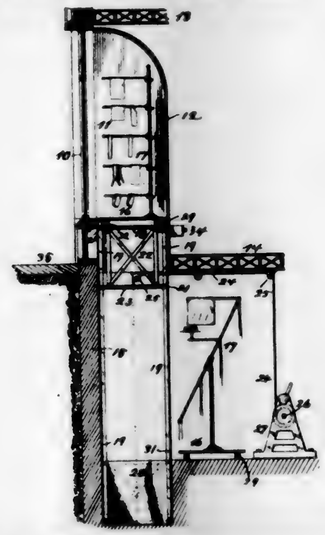
2. In a resonator or amplifier for phonographs and the like the combination of a tube *a* having a flat bottom *b* and a cylindrical neck *c* with one or more cup-shaped modulators *d e* and a cone *h* adapted to fit the mouth of the tube *a* all substantially as specified for the purpose stated.

3. In a resonator or amplifier for phonographs and the like the combination with the tube *a* attached to the sound-box of the instrument, of a reflector consisting of a semicylinder *k* having a curved top *m* and side wings *n n*, the semicylinder *k* being secured to a ring *l* adapted to fit the mouth of the tube *a*, all substantially as specified for the purpose stated.

4. In a resonator or amplifier for phonographs and the like the combination of a tube *a* having a flat bottom *b* and a cylindrical neck *c* with one or more cup-shaped modulators *d e* a cone *h* adapted to fit the tube *a* and a reflector *k* having a curved top *m* and side wings *n n* and a ring

l secured to the reflector *k* all substantially as specified and for the purpose stated.

709,985. SHOW-WINDOW CONSTRUCTION. HAMILTON HUNTER, Covington, Ky., assignor of one-half to Shelley D. Rouse, Covington, Ky. Filed Nov. 4, 1901. Serial No. 81,030. (No model.)

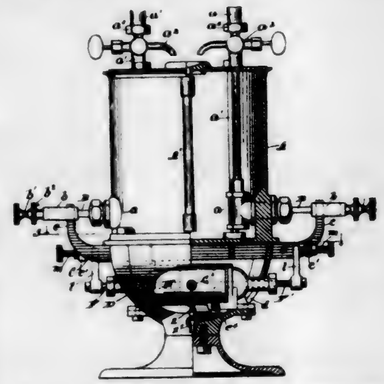


Claim.—1. The combination with a show-window inclosure being open vertically in one direction, of a floor for it independent from the other parts which form the inclosure of the show-window provided with casters on its under side and intended to carry the fixtures, a platform upon which this floor rests, means for moving this platform and floor thereon vertically out of the space below the show-window inclosure to a position where the floor with the fixtures thereon may be laterally moved off therefrom, and whereby this platform with these parts may be returned again to bring the floor back to its normal position within the show-window inclosure, means for detachably holding it in each normal position guides to hold platform and floor in proper position during their vertical movement, each guides being cut out at 31 to permit the lateral movement of the floor to and from the platform and curbs 32 to guide the floor in such lateral movement.

2. The combination with a show-window inclosure being open below, where it communicates with a laterally open space, of a floor for this inclosure which normally closes this opening therein, a combined platform and frame 22 upon which this floor rests in a manner to be free for lateral removal therefrom, said platform-frame being capable of a descending movement into the laterally open space below and to a depth therein permitting removal therefrom and corresponding replacing of the show-window floor and the goods thereon, in a lateral direction, means for raising these parts to return the floor to its normal position within the show-window inclosure, guides extending downwardly from the lower part of the show-window inclosure into the open space below between which this platform-frame travels during its movements and which are so spaced as to permit between them the lateral removal of the floor mentioned and resting on said platform, which latter remains in guiding contact with and between said guides and means to hold the parts in their raised position.

3. The combination with a show-window inclosure being open below, of a floor for this inclosure which normally closes this opening therein, a combined platform and frame 22 upon which this floor rests in a manner to be free for lateral removal therefrom, said platform-frame being capable of a descending movement, a pit to receive this platform-frame to permit its descent to a depth bringing the show-window floor to a level with the stationary floor surrounding the top of the pit to permit such show-window floor to be laterally moved off and on from such platform, supports 38 bridging the clearance between the platform-frame and the edge of the pit when the former is in its lowest position, means for raising these parts to return the floor to its normal position within the show-window inclosure, guides between which this platform-frame travels during its movements and means to hold the parts in their raised position.

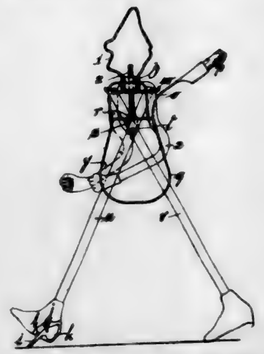
709,986. APPARATUS FOR OPERATING LUBRICATING-PUMPS. BARRY IVES, Chicago, Ill., assignor to Charles M. Rogers and Louis C. Rollo, Chicago, Ill. Filed Feb. 2, 1901. Renewed Dec. 30, 1901. Serial No. 87,848. (No model.)



Claim.—1. In an apparatus for operating lubricating-pumps, the combination with the pump-body, of a slide comprising two parallel bars movably located in the lower portions of the body for the purpose of reciprocating the pistons of the pump, means at the ends of the slide to adjustably secure it to the piston-rods of the pump, a steam-engine located beneath the pump-body, reciprocating piston-rods extending from each end of said engine, an arm on each of said rods extending upwardly and between the bars of the slide, and adjustable means located at each end of the slide whereby the movement thereof imparted by the arms may be changed.

2. In an apparatus for operating lubricating-pumps, the combination with the pump-body, of a slide for the purpose of reciprocating the pistons of the pump, means at the ends of the slide to adjustably secure it to the piston-rods of the pump, an engine for operating the said slide, said engine comprising an expansion-chamber and a reciprocating piston-head therein, arms connected to and operated by means of said piston-head, and adjustable means engaged by said arms whereby the range of movement imparted to said slide may be changed.

709,987. WALKING TOY. EDWARD A. JEFFERIS, Moseley, near Birmingham, England. Filed June 17, 1902. Serial No. 112,062. (No model.)



Claim.—1. In walking toys, the combination with a jointed figure of a counterweighted stilt-piece in a foot of the said figure automatically varying the length of the leg, a propelling-handle, and a leg-jerking attachment on the body of the figure, substantially as set forth.

2. In walking toys, the combination with a jointed figure of a counterweighted stilt-piece in a foot of the said figure automatically varying the length of the leg, a propelling-handle, and a leg-jerking spring attachment disposed and fixed between the handle and the body of the figure, substantially as set forth.

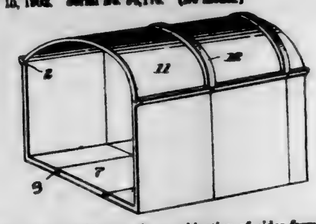
3. In walking toys, the combination with a jointed figure of a counterweighted stilt-piece in a foot of the said figure automatically varying the length of the leg, a propelling-handle, a leg-jerking attachment on the body of the figure, and connections between the legs and the arms transmitting movement from the one to the other, substantially as set forth.

4. In walking toys, the combination with a jointed figure of a counterweighted stilt-piece in a foot of the said figure automatically varying the length of the leg, a propelling-handle, a leg-jerking spring attachment, and a pair of arms in rigid connection with each other and jointed with extensions from the legs of the figure, substantially as set forth.

5. In walking toys, the combination with a jointed figure of a counterweighted stilt-piece in a foot of the said figure automatically varying the length of the leg, a propelling-handle, a leg-jerking spring attachment, and a pair of arms in rigid connection with each other and with the head of the figure and jointed with extensions from the legs of the same, substantially as set forth.

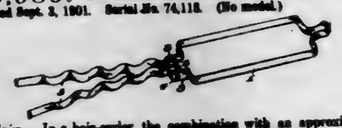
6. In walking toys, the combination with a jointed figure of a counterweighted stilt-piece in a foot of the said figure automatically varying the length of the leg, a propelling-handle, a leg-jerking spring attachment, a pair of arms in rigid connection with each other and with the head of the figure and jointed with extensions from the legs of the same, and a steadying-piece fixed to the body part and projecting into the interior of the head, substantially as set forth.

709,988. **BURIAL-CASE.** JOHN B. KERR, Jr., Toronto, Ohio. Filed Feb. 15, 1902. Serial No. 94,170. (No model.)



Claim.—In a burial-case, the combination of sides formed in sections with upwardly-extending flanges carried by the sections, V-shaped tongues carried by the sides of the sections with corresponding grooves formed in the sides of the adjacent sections to receive said tongues, inwardly-extending portions carried by the lower ends of the sections with flanges carried by the ends of said portions, a flanged bottom engaging said flanges of the said portions, the end sections being curved, and a flanged arched cover provided with strengthening-ribs, the ends of the cover being seated against the flanges of the side sections, and the strengthening-ribs engaging the upper face of the side-section flanges, substantially as described.

709,989. **HAIR-CRIMPER.** JOHN A. KLARER, Pittsburg, Pa. Filed Sept. 3, 1901. Serial No. 74,118. (No model.)



Claim.—In a hair-curler, the combination with an approximately rectangular frame having its forward end formed intermediate its sides with an outwardly-extending loop, the inner end thereof being contracted, the rear end of said frame provided with angular extensions having openings, of a pair of resilient corrugated prongs pivotally mounted upon a pin arranged in the openings of the said extensions, the free ends of said prongs adapted to normally spring apart when in open position and pressed together and fitted between the contracted portion of the loop when in closed position, a washer interposed between the rear ends of the said prongs, and a washer interposed between each prong and the angular extensions of the frame, substantially as described.

709,990. **LEVEL, PLUMB, AND INCLINOMETER.** GEORGE W. LEMLE, Hagingrove, Iowa, assignor of one-half to George J. Bushbeck, Hagingrove, Iowa. Filed Dec. 28, 1901. Serial No. 86,723. (No model.)

Claim.—1. An instrument of the character described, comprising a block, a ring having a hollow extension, rotatably mounted within said block, an adjustable support within said hollow extension, and a pointer suspended from said adjustable support, adapted to swing over an indicator in said ring, substantially as set forth.

2. An instrument of the character described, comprising a block, a ring, having a hollow extension, rotatably mounted within said block, a plug adjustable within said extension, and a pointer suspended from said plug, adapted to swing over an indicator in said ring, substantially as set forth.

3. An instrument of the character described, comprising a block, a ring, having a tubular extension, rotatably mounted within said block, a plug adjustable with said extension, and a pointer suspended from said plug, adapted to swing over an indicator in said ring, substantially as set forth.

4. An instrument of the character described, comprising a block having a recess therein, bearing-plates secured to the sides of said block, having openings opposite said recess and annular depressions at the edge of said openings, a ring, having a hollow extension, rotatably mounted between said bearing-plates, a plug adjustable within said hollow extension, and a pointer, suspended from said plug, adapted to swing over an indicator within said ring, substantially as set forth.

5. An instrument of the character described, comprising a block, a ring, having a hollow extension, rotatably mounted within said block, a pointer, suspended from within said hollow extension, adapted to swing over the indicator in said ring, and a plate, connected to said ring, adapted to be flush with the edge of said block, substantially as set forth.

6. An instrument of the character described, comprising a block, having bearing-plates provided with openings secured to said block, a ring, having a hollow extension, rotatably mounted between said bearing-plates, a pointer, suspended from within said hollow extension, adapted to swing over an indicator in said ring, and transparent disks interposed between said bearing-plates and said ring, substantially as set forth.

7. An instrument of the character described, comprising a block, a ring having a hollow extension, rotatably mounted within said block, an indicator within said ring, comprising a wire suitably held at opposite ends in the edges of a cup, and a pointer, suspended from within said tubular extension, adapted to swing over said indicator, substantially as set forth.

709,991. **CAR-FENDER.** JOHN H. LOTTER, Covington, Ky., assignor to the Fred J. Meyers Manufacturing Company, Hamilton, Ohio. Filed June 23, 1902. Serial No. 113,788. (No model.)

Claim.—1. In a car-fender, the combination, substantially as set forth, with a car, a scoop-shaft supported thereunder forward of the front wheels, a forwardly-projecting scoop fast to the scoop-shaft, means for elevating the scoop, a buffer articulately supported at the front end of the car, a trip-shaft supported under the car to the rear of the buffer, and arms fast thereon and linked to the buffer, of a lever longitudinally disposed below the car and mounted on a pivot between and above said two shafts, a trigger-arm fast on the scoop-shaft and normally engaging the rear end of said lever, a forwardly-projecting trip-arm fast on said trip-shaft under the forward end of said lever, and a connection between said trip-arm and the forward end of said lever.

2. In a car-fender, the combination, substantially as set forth, with a car, a scoop-shaft supported thereunder forward of the front wheels, a forwardly-projecting scoop fast to the scoop-shaft, means for elevating the scoop, a buffer articulately supported at the front end of the car, a trip-shaft supported under the car to the rear of the buffer, and arms fast thereon and linked to the buffer, of a lever longitudinally disposed below the car and mounted on a pivot between and above said two shafts, a trigger-arm fast on the scoop-shaft and normally engaging the rear end of said lever, a forwardly-projecting trip-arm fast on said trip-shaft under the forward end of said lever, a connection between said trip-arm and the forward end of said lever, and a hook-lug projecting downwardly from the rear portion of said lever and adapted to engage to the rear of said trigger-arm when the scoop is in depressed active position.

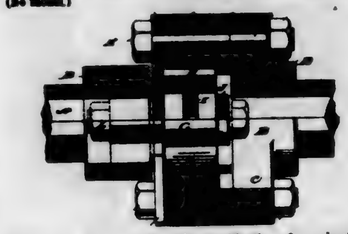
3. In a car-fender, the combination, substantially as set forth, with a car, a scoop-shaft supported thereunder forward of the front wheels, a forwardly-projecting scoop fast to the scoop-shaft, means for elevating the scoop, a buffer articulately supported at the front end of the car, a trip-shaft supported under the car to the rear of the buffer, and arms fast thereon and linked to the buffer, of a lever longitudinally disposed below the car and mounted on a pivot between and above said two shafts, a trigger-arm fast on the scoop-shaft and normally engaging the rear end of said lever, a forwardly-projecting trip-arm fast on said trip-shaft under the forward end of said lever, a connection between said trip-arm and the forward end of said lever, and a spring acting between the car and said lever and serving to urge the lever to normal position.

4. In a car-fender, the combination, substantially as set forth, with a car, a scoop-shaft supported thereunder forward of the front wheels, a forwardly-projecting scoop fast to the scoop-shaft, means for elevating the scoop, a buffer articulately supported at the front end of the car, a trip-shaft supported under the car to the rear of the buffer, and arms fast thereon and linked to the buffer, of a lever longitudinally disposed below the car and mounted on a pivot between and above said two shafts, a trigger-arm fast on the scoop-shaft and normally engaging the rear end of said lever, a forwardly-projecting trip-arm fast on said trip-shaft under the forward end of said lever, a connection between said trip-arm and the forward end of said lever, and a spring acting between the car and said trip-arm and serving to elastically resist the retreat of the buffer.

5. In a car-fender, the combination, substantially as set forth, with a car, a scoop-shaft supported thereunder forward of the front wheels, a forwardly-projecting scoop fast to the scoop-shaft, means for elevating the scoop, a buffer articulately supported at the front end of the car, a trip-shaft supported under the car to the rear of the buffer, and arms fast thereon and linked to the buffer, of a lever longitudinally disposed below the car and mounted on a pivot between and above said two shafts, a trigger-arm fast on the scoop-shaft and normally engaging the rear end of said lever, a forwardly projecting trip-arm fast on said trip-shaft under the forward end of said lever, a connection between said trip-arm and the forward end of said lever, and a spring acting between the car and said lever and serving to urge the lever to normal position.

7. In a car-fender, the combination, substantially as set forth, with a car, a scoop-shaft supported thereunder forward of the front wheels, a forwardly-projecting scoop fast to the scoop-shaft, means for elevating the scoop, a buffer articulately supported at the front end of the car, a trip-shaft supported under the car to the rear of the buffer, and arms fast thereon and linked to the buffer, of a lever longitudinally disposed below the car and mounted on a pivot between and above said two shafts and having its rear end heavier than its forward end, a trigger-arm fast on the scoop-shaft and normally engaging the rear end of said lever, a forwardly-projecting trip-arm fast on said trip-shafts under the forward end of said lever, and a connection between said trip-arm and the forward end of said lever.

709,992. **UNIVERSAL COUPLING.** ALLAN G. MATHER, Milwaukee, Wis., assignor of one-half to Allis-Chalmers Company, Chicago, Ill., a Corporation of New Jersey. Filed May 2, 1902. Serial No. 105,662. (No model.)



Claim.—1. In a coupling, the combination of a pair of shafts; a driver rigidly affixed to each shaft, each driver having a pair of outwardly-extending arms, the arms of one driver being placed at right angles to those of the other; a roller extending outwardly from the end of each arm; a slotted block located intermediate the arms with the rollers extending into the slots; and means for securing the block to the drivers.

2. In a coupling, the combination of a pair of shafts; a driver rigidly affixed to each shaft, each driver having a pair of outwardly-extending arms, the arms of one driver being placed at right angles to those of the other; a roller extending outwardly from each arm at right angles thereto; a block located between the arms of the drivers, said block being provided with radial slots into which the rollers extend; a strap passed down upon each side of the block; and means for securing each strap to the driver which occupies a position upon the opposite side of the block therefrom.

3. In a coupling, the combination of a pair of shafts; a driver rigidly affixed to each shaft, each driver having a pair of outwardly-extending arms, and each arm having a socket formed therein; shoulder-pins seated in said sockets; rollers carried by the outer ends of said pins; a block located between the arms of the drivers, said block being formed with a series of radial slots into which the rollers pass; straps passed down upon opposite sides of the block in line with the ends of the rollers; and bolts extending through the straps, the shoulder-pins and the drivers.

709,998. **ARTICLE OF MANUFACTURE HAVING AN ELASTIC PORTION AND A SECURING PORTION.** JOSEPH G. MOONY, Erie, Pa. Filed Apr. 28, 1902. Serial No. 105,015. (No model.)

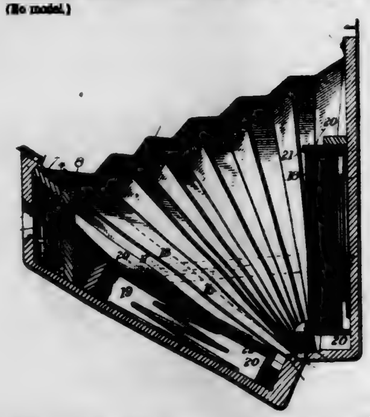
Claim.—1. In a rubber article of manufacture having a securing portion and an elastic tread portion, a securing portion formed of fiber-

of the securing portion, both portions being formed of the same compound.

709,994. TIP FOR THE ENDS OF PNEUMATIC-TIRE TUBES. JOSEPH G. MOONEY, Erie, Pa. Filed Apr. 23, 1902. Serial No. 105,016. (No model.)

Claim.—A tip for pneumatic tire tubes formed of fiber-stock with the general longitudinal direction of fibers.

709,995. FOLDING MAGAZINE HAND-CAMERA. EDWARD H. MORSE, New Orleans, La. Filed May 13, 1901. Serial No. 60,023. (No model.)



Claim.—1. In a camera, a folding box comprising separate hinged sections, a magazine arranged in each of said box-sections and provided at two of its angularly-related edges with plate-holding projections, said plate-holding projections of one magazine being arranged in opposite relation to those of the other so that the said projections of one magazine will overlap the edges of the outermost plate in the other, plate-displacing means carried by one of the magazines, a shifting device coöperating with the said plate-displacing means for effecting a transferal of an exposed plate into the magazine therefor, a bellows permanently fitted to one of the box-sections and detachably secured to the other box-section, a brace having a longitudinal slot terminating in a notch, said brace being pivoted to one of the box-sections, a stud disposed upon the other box-section, and upon which the said brace is adapted to slide for holding the box-sections in their spread-apart positions.

2. In a camera, a folding box comprising separate hinged box-sections, a magazine arranged in each box-section and provided with plate-retaining means, auxiliary plate-retaining means, plate-displacing means carried by one of the magazines, means coöperating with said plate-displacing means for effecting a transferal of an exposed plate into the magazine therefor, and a bellows arranged to detachably cover the open side of the box between the separate sections thereof.

3. In a camera, a folding box comprising separate hinged box-sections, a magazine arranged in each box-section and provided with plate-retaining means, auxiliary spring-actuated plate-retaining means, plate-displacing means carried by one of the magazines, and a shifting device coöperating with said plate-displacing means for effecting a transferal of an exposed plate into the magazine therefor.

4. In a camera, a folding box comprising separate hinged sections, a magazine arranged in each of said sections, and provided at two of its angularly-related edges with plate-holding projections, said plate-holding projections of one magazine being arranged in opposite relation to those of the other so that the said projections of one magazine will overlap the edges of the outermost plate in the other, springs of different strength arranged respectively in the separate magazines, and a plate-shifting device, ing shifting-arm adapted to engage with the diagonally opposite corner of the said plate.

6. In a camera, a folding box comprising separate hinged box-sections, a magazine arranged in each box-section and provided with plate-retaining means, plate-displacing means carried by one of the magazines, a shifting device cooperating with said plate-displacing means for effecting a transferal of an exposed plate into the magazine therefor, a bellows permanently fitted to one of the box-sections and carrying a rectangular-shaped frame at its free end, angular levers pivoted upon the inner face of the other box-section, adapted to swing over said frame and secure the free end of the bellows thereto, and a brace for holding the box-sections in their spread-apart positions.

7. In a camera, a folding box having in each of its separate sections a magazine provided with plate-retaining means, said magazines being brought into superposed matched relation by the folding action of the box-sections, plate-displacing means in one of the magazines, means for shifting a plate from one magazine to the other when brought into said superposed matched relation, a bellows permanently fitted to one of the box-sections and having a reinforced free end, levers disposed upon the inner face of the other box-section and adapted to detachably secure the free end of the bellows thereto, and a brace for holding and locking the box-sections in their spread-apart positions.

8. In a camera, a folding box comprising separate hinged box-sections, each having a magazine provided with plate-retaining means, plate-displacing means carried by one of the magazines, means coöperating with the said plate-displacing means for effecting a transferal of a plate from one magazine to the other, a bellows permanently fitted to one of the box-sections and having a reinforced free end, means disposed upon the other box-section adapted to detachably secure the free end of the bellows thereto, and means for holding the box-sections in their spread-apart positions.

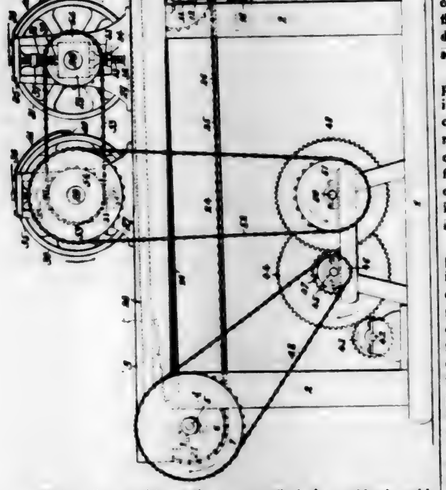
709,996. SIGNAL-LAMP FOR TELEPHONE-SWITCHBOARDS. FRANK R. MCBERTY and FREDERICK H LOVERIDGE, Evanston, Ill., assignors to the Western Electric Company, Chicago, Ill., a Corporation of Illinois. Filed May 14, 1900. Serial No. 16,553. (No model.)

Claim.—1. An incandescent lamp comprising the open tubular stem *a* having the enlargement *a'* a short distance below its tip, terminal wires *b b'* sealed to the upper edge of the stem and extending down outside the stem past the enlargement *a'*, a filament *b²* carried by the terminal wires, and a cylindrical cap *d* rounded at the upper end, with its lower end fitting over the stem, inclosing the filament and sealed to the enlarged portion of the stem in an annular seal, the terminal wires passing through and sealed in the annular seal, substantially as set forth.

2. In combination, in an electric lamp, the cylindrical cap *d* having the rounded extremity, the tubular stem *a* having the enlargement *a'* formed thereon, the said enlargement being sealed at its equator to the lower edge of the said cap *d*, the leading-in wires passing through said seal and secured to the stem near its end within the bulb, said stem being open within the bulb, the filament carried upon the leading-in wires, the stem being sealed off after exhaustion outside the said seal, as described.

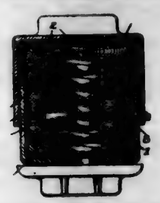
3. In a base for cylindrical incandescent lamps, the combination with the block *f* having the central perforation, of the terminal pieces *e* and *e'* formed to partially embrace the lamp-bulb, and having contracted portions extending through and secured in the central perforation of said block *f*, as described.

4. In combination with a cylindrical incandescent lamp-bulb, terminals therefor, consisting of the plates *e* and *e'* partially embracing the bulb, situated on opposite sides thereof, having contracted extensions, the cylindrical block *f* having a central perforation through which said extensions pass, said block having the wedge-shaped transverse groove therein, against which the terminal plates bear, and the extensions being bent outward at the rear of the block to hold them in place, as described.



Claim.—In a machine of the type described, the combination with the framework, bearings attached to one end thereof, a shaft journaled therein and having sprocket-wheels, a second shaft at the other end of the framework located normally higher than the first-mentioned shaft and having sprocket-wheels, bearings for this shaft having depending angle-arms sliding vertically in brackets on the framework, screws engaging said angle-arms and having gears, and a cross-shaft having gears meshing with those on the screws and provided with a crank-handle; of parallel bars having other bearings connected and mounted upon both said shafts, guides on said bars, a conveyer comprising chains traveling around said sprocket-wheels and cross-slats moving over the guides; and upper rollers mounted on the framework above the conveyer, as and for the purpose set forth.

709,998. SPRING-CUSHION. ALVIN C. MCCORD, Chicago, Ill., assignor to McCord & Company, Chicago, Ill., a Corporation of New Jersey. Filed Jan. 8, 1902. Serial No. 88,961. (No model.)



Claim.—1. The combination with a plurality of coiled springs arranged one within another, of upper and lower cap-plates constituting inclosing retaining-plates for the coiled springs and having side flanges arranged adjacent to each other, one of said plates being formed to have its flanges sprung into frictional engagement with the companion flanges under pressure, substantially as described.

2. The combination with a coiled spring, of upper and lower cap-plates constituting inclosing retaining-plates for the coiled spring and having side flanges arranged adjacent to each other, one of said plates being formed to have its flanges sprung into frictional engagement with the companion flanges under pressure, substantially as described.

3. The combination with a plurality of coiled springs arranged one within another, of upper and lower cap-plates constituting inclosing retaining-plates for the coiled springs and having side flanges arranged adjacent to each other, one of said plates being formed to have its flanges sprung into frictional engagement with the companion flanges under pressure, the plate that is adapted to have its flanges sprung being formed flanges sprung being formed into two parts, each having a flange, thus dividing the said cap-plate into two distinct levers, substantially as described.

5. In combination with one or more coiled springs, an upper cap-plate having downwardly-depending flanges, and a lower cap-plate having flanges upwardly extending adjacent to the upper plate-flanges, one of said plates having a convexly-formed base and having its flanges arranged within the flanges of the other plate, whereby the flanges of the convexly-formed cap-plate may be sprung outwardly under pressure into frictional engagement with the flanges of the other cap-plate, the said cap-plates, in addition to acting as recoil-retarders, also acting as inclosing retaining-plates for the coiled spring or springs, substantially as described.

6. In combination with one or more coiled springs, an upper cap-plate having downwardly-depending flanges, and a lower cap-plate having flanges upwardly extending adjacent to the upper plate-flanges, one of said plates having a convexly-formed base and having its flanges arranged within the flanges of the other plate, whereby the flanges of the convexly-formed cap-plate may be sprung outwardly under pressure into frictional engagement with the flanges of the other cap-plate, the said cap-plates, in addition to acting as recoil-retarders, also acting as inclosing retaining-plates for the coiled spring or springs, the cap-plate that is provided with the convexly-curved base being divided into structurally distinct levers, each having a flange and a portion of the base of the said cap-plate, substantially as described.

7. The combination with a spring, of a cap-plate therefor and a friction element, the said cap-plate being formed to have its flanges relatively moved to bring the cap-plate into frictional contact with the friction element, the spring being disposed between said flanges substantially as described.

8. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, said cap-plate moving or tending to move with reference to the latter part, whereby it may be brought into frictional engagement with a friction element to reduce the vibration of the spring, substantially as described.

9. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, the said cap-plate having a flanged portion moving or tending to move with respect to the latter part, whereby frictional engagement may be effected with a friction element to decrease the vibration of the spring, substantially as described.

10. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a spring-operated cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, whereby the spring-operated cap-plate may be moved into frictional engagement with the friction element to decrease the vibration of the spring, substantially as described.

11. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, the said cap-plate having a spring-operated flange portion whereby frictional engagement may be effected with a friction element to decrease the vibration of the spring, substantially as described.

12. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of cap-plates upon the ends of the spring and inclosing or surrounding the same, one of the said cap-plates being spring-operated to effect its frictional engagement with a companion cap-plate, substantially as described.

13. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of cap-plates provided upon the ends thereof and inclosing or surrounding the same, one of the said cap-plates tending to move with reference to its cushioned part to bring it into frictional engagement with the companion cap-plate, substantially as described.

14. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of cap-plates upon the ends thereof and inclosing or surrounding the same, one of the said cap-plates being provided with a flange which moves or tends to move with respect to its cushioned part to bring it into frictional engagement with the companion cap-plate, substantially as described.

15. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of cap-plates provided upon the ends thereof and inclosing or surrounding the same, one of the said cap-plates being spring-operated, whereby it is brought into frictional engagement with the companion cap-plate, substantially as described.

16. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of cap-plates upon the ends thereof and inclosing or surrounding the same, one of the said cap-plates being provided with a spring-operated flange to bring the same into frictional engagement with the companion cap-plate, substantially as described.

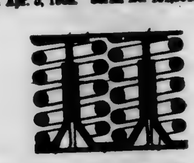
17. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, and a friction element, said cap-plate moving or tending to move with reference to the latter cushioned part, whereby it may be brought into frictional engagement with said friction element to reduce the vibration of the spring, substantially as described.

18. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, and a friction element, the said cap-plate having a flanged portion moving or tending to move with respect to the latter cushioned part, whereby frictional engagement may be effected with said friction element to decrease the vibration of the spring, substantially as described.

19. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element, and a spring-operated cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, whereby the spring-operated cap-plate may be moved into frictional engagement with the friction element to decrease the vibration of the spring, substantially as described.

20. In a spring-cushion, the combination with a coiled spring interposed between the parts to be cushioned, of a friction element, and a cap-plate inclosing or surrounding the spring and interposed between the spring and one of the said parts, the said cap-plate having a spring-operated flange portion, whereby frictional engagement may be effected with the friction element to decrease the vibration of the spring, substantially as described.

709,999. SPRING-CUSHION. ALVIN C. McCORD, Chicago, Ill., assignor to McCord & Company, Chicago, Ill., a Corporation of New Jersey. Filed Apr. 5, 1902. Serial No. 101,801. (No model.)



Claim.—1. In a spring-cushion, the combination with a plurality of coiled springs placed side by side, of upper and lower cap-plates, friction elements carried by the upper cap-plate corresponding in number with the number of coiled springs and extending to the interior thereof, and friction elements carried by the lower cap-plate corresponding in number with the number of coiled springs and also extending into the interior of the coiled springs, a friction element within each coiled spring being formed of spring metal, whereby it is brought into frictional engagement with a companion friction element by reason of its resiliency, substantially as described.

2. In a spring-cushion, the combination with four coiled springs arranged at the corners of a quadrilateral, of upper and lower cap-plates, friction elements carried by the upper cap-plate corresponding in number with the number of coiled springs and extending to the interior thereof, and friction elements carried by the lower cap-plate corresponding in number with the number of coiled springs and also extending into the interior of the coiled springs, a friction element within each coiled spring being formed of spring metal, whereby it is brought into frictional engagement with a companion friction element by reason of its resiliency, substantially as described.

3. In a spring-cushion, the combination with a coiled spring, of a friction element composed of spring metal extending into the interior thereof, and a second friction element adapted for frictional and sliding connection with the aforesaid friction element by reason of the resiliency of the first aforesaid friction element, substantially as described.

4. In a spring-cushion, the combination with a coiled spring, of a friction element composed of spring metal extending into the interior thereof, and a second friction element adapted for frictional and sliding connection with the aforesaid friction element by reason of the resiliency of the first aforesaid friction element, one of said friction elements being formed at its base to fit the interior of the coiled spring, substantially as described.

5. In a spring-cushion, the combination with a coiled spring, of a friction element composed of spring metal extending into the interior thereof, and a second friction element adapted for frictional and sliding connection with the aforesaid friction element by reason of the resiliency of the first aforesaid friction element, both of said friction elements being formed at their bases to fit the interior of the coiled spring, substantially as described.

6. In a spring-cushion, the combination with a coiled spring, of a pair of spring-jaws within the same, mounted at one end of the coiled spring, a tongue also within the coiled spring and mounted at the other end thereof, the tongue being engaged between the jaws and being adapted for sliding and frictional engagement therewith, the jaws engaging the tongue by reason of the resiliency of the jaws, substantially as described.

7. In a spring-cushion, the combination with a coiled spring, of an element for frictional contact formed of resilient material and projecting within the coiled spring, substantially as described.

710,000. RAIL-JOINT. JOSEPH J. McDERMOTT, New Brighton, Pa. Filed Dec. 10, 1901. Serial No. 85,522. (No model.)

Claim.—1. A rail-joint comprising a chair having a portion thereof bent upon itself and forming a fish-plate, bolts, passing through the portions bent upon themselves, and adapted for engagement with a tie, combined with a second fish-plate, and a bolt for holding said plates against the opposite sides of a rail, as set forth.

2. A rail-joint, comprising a chair having a portion thereof bent upon itself and forming a fish-plate, bolts, passing through said portions bent upon themselves, and adapted for engagement with a tie, combined with a second fish-plate, each fish-plate being bent upon itself twice in vertical planes, and bolts passing through the web of a rail and connecting said plates, as set forth.

3. A rail-joint comprising a chair having a portion thereof bent upon itself, and forming a fish-plate, a bolt, passing through such portions bent upon themselves, and adapted for engagement with a tie, a second fish-plate resting upon said chair, and engaging an upturned edge of said chair, said plates each being bent upon itself twice in vertical planes, a bolt connecting said plates and designed to hold vertical portions of the plates against the under surface of the tread of a rail and the flanges of the base of the rail, as set forth.

4. A rail-joint, comprising a chair having a portion thereof bent upon itself, and forming a fish-plate, said portion then bent, being bolted to the chair, a second fish-plate bolted to the chair and engaging an upturned edge of the latter, each of said plates being bent upon itself twice in vertical planes, a bolt passing through the adjacent vertically-disposed portions of the plates on opposite sides of the web of a rail, each plate being bent to form a brace between the horizontal and outer vertically-disposed portions of said plates, as set forth.

710,001. PRESCRIPTION-CABINET. JOHN J. HEMMITT, Warren, Pa., assignor of one-half to John J. Taylor, Bnd, Warren, Pa. Filed July 30, 1901. Serial No. 70,288. (No model.)

Claim.—1. A device of the class described comprising a receptacle, a follower loosely arranged within the receptacle, and the resilient binders mounted on the follower and consisting of laterally-movable loops engaging the sides of the receptacle and holding the follower in an upright position, said loops being also arranged to engage the bottom of the receptacle and the sides thereof when the follower is tilted, whereby the follower is firmly held in an inclined position, substantially as described.

2. A device of the class described comprising a receptacle, a follower loosely arranged within the receptacle, and the opposite binders consisting of resilient clamping and supporting loops offset from the follower and having terminal portions arranged adjacent to each other and normally spaced from the follower and adapted to be simultaneously operated, substantially as described.

3. A device of the class described comprising a receptacle, a follower loosely arranged therein, and opposite binders consisting of inwardly-extending resilient loops arranged approximately parallel with the follower and provided with angularly-disposed arms connected with the latter and arranged to engage the opposite walls of the receptacle, said loops having terminal portions arranged contiguous to each other and adapted to be simultaneously operated, substantially as described.

4. A clamping device for a follower comprising oppositely-disposed binders, each composed of an inwardly-extending converged loop having the outer ends thereof merged into angular members, coils disposed at the lower ends of said angular members, and inwardly-projecting arms connected with said loops and having rearwardly-curved terminals.

5. A cabinet for holding prescriptions having means for tightly pressing and firmly supporting the latter in the form of opposite binders each comprising a rear inwardly-extending converged loop merging into outer angular members continuing into front coils from which arms inwardly project, the said arms having rearwardly-curved terminals, the latter and the inner terminals of the loops extending across the planes of each other.

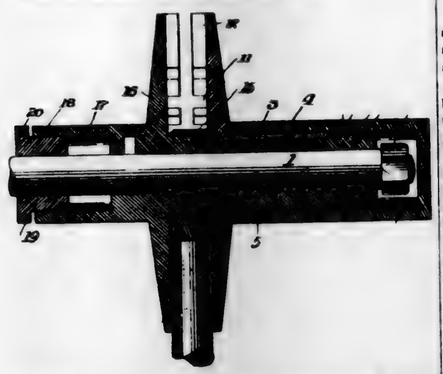
6. A cabinet for holding prescriptions having means for tightly holding and supporting the latter in the form of a follower having binders comprising rear inwardly-converged loops and front curved terminals, the curved terminals and the inner terminals of the loops being free to move past each other.

7. A prescription-cabinet having oppositely-disposed binders comprising inwardly-extending loops merging into angular members, said members continuing into coils having inwardly-projecting arms.

8. A prescription-cabinet provided with a follower having binders comprising inwardly-extending loops and inwardly-extending terminals disposed on different planes.

9. A prescription-cabinet provided with a follower having binders comprising inwardly-extending loops and inwardly-extending terminals, and angular arms connecting said terminals and loops at their outer ends.

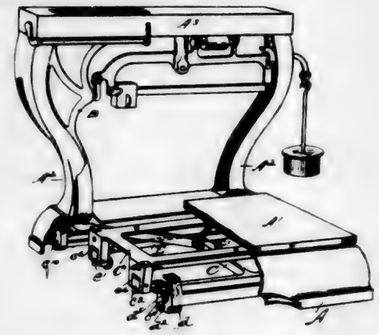
710,002. WHEEL-HUB. EDWARD HOLAR, Wolf Summit, W. Va. Filed Oct. 21, 1901. Serial No. 79,698. (No model.)



Claim.—The hub comprising the exteriorly-threaded portion 3, the integral spoke-flange 16 having openings in its inner face, and the hollow extension 17, in combination with the spoke-flange 11 sleeved on the hub and provided on its inner face with openings, a collar sleeved on the hub between the spoke-flanges and receiving the ends of the wheel-spokes, a cap threaded on the outer end of the hub, and means for securing the cap to the hub, substantially as described.

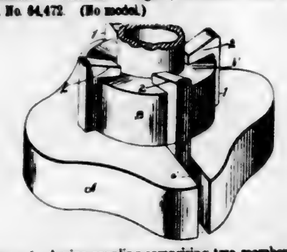
710,008. PLATFORM-SUPPORT FOR SCALES. FRANCIS C. OSBORN, Detroit, Mich. Filed Dec. 17, 1900. Serial No. 40,180. (No model.)

Claim.—1. In scale construction, the combination of the base provided with fixed bearings, the frame B and the main platform-lever having one end pivoted directly on the fixed pivot-bearings on the base at two points and the other end pivoted directly to the frame B at two points, whereby the lever and frame are held against horizontal movement of translation, substantially as described.



2. The combination of the base, the subbase, pivots on which the subbase rests, lugs on the base and subbase, and means for drawing the lugs together to lift the subbase off from the pivots, substantially as described.

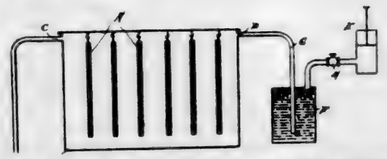
710,004. PIPE-COUPLING. RUBA L. OSGOOD, Tooele, Utah, administratrix of Leonard S. Osgood, deceased. Filed June 13, 1901. Serial No. 64,472. (No model.)



Claim.—1. A pipe-coupling comprising two members, having substantially flat contiguous faces to adapt them to be brought together by a lateral movement, one of said members carrying a plurality of stationary clamping-bolts and a removable clamping-bolt, each of which is provided with lateral offset and downwardly-inclined heads, the other member having an inclined outer face to be engaged by the inclined heads of the clamping-bolts, and means on the bolts to clamp the members together.

2. In a pipe-coupling, the combination of a flanged member having a plurality of transverse apertures and a radial slot, a ring member having its outer face inclined inwardly and downwardly, a plurality of clamping-bolts stationarily mounted in the apertures, a removable clamping-bolt in the slot, each of said bolts having laterally-offset and downwardly-inclined heads, the contiguous faces of the members being substantially flat to adapt them to be brought together by a lateral movement.

710,005. PROCESS OF MAKING ORGANIC PEROXIDS. RALPH H. PAGE, Detroit, Mich. Filed Sept. 10, 1901. Serial No. 74,904. (No specimens.)



Claim.—1. The process of making organic peroxids, which consists in mixing an aromatic aldehyde and the anhydrid of a fatty acid and then oxidizing the mixture and limiting the action of the oxidizing agent to obtain a restricted oxidation for the purpose set forth.

2. The process of making organic peroxids which consists in subjecting a mixture of aromatic aldehyde and anhydrid of a fatty acid in film form to the action of a restricted supply of a gaseous oxidizing agent.

3. The process of making organic peroxids which consists in saturating a sheet or strip of absorbent material with a mixture of aromatic aldehyds and anhydrid of a fatty acid, and subjecting the saturated strip or sheet to retarded oxidation, for the purpose set forth.

4. The process of making organic peroxids which consists in saturating a sheet or strip of absorbent material with a mixture of aromatic aldehyds and anhydrid of a fatty acid, and oxidizing the mixture while supported upon those strips.

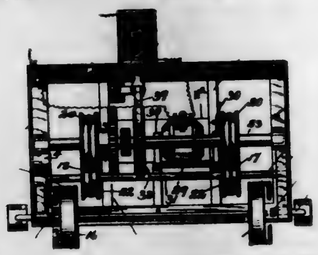
710,006. BUNG-BUSHING. GEORGE H. REMER, Cincinnati, Ohio, assignor to the Perfection Bush Company, Covington, Ky., a Corporation of Kentucky. Filed Jan. 8, 1902. Serial No. 88,841. (No model.)

Claim.—1. A bung-bushing comprising an annulus adapted to lie within a bung-hole and carrying at its periphery a flange to enter a recess in the edges of the abutting staves around the bung-hole, said recess being of a less depth than the width of the flange, a space being left between the edges of said staves and the periphery of the annulus, substantially as set forth.

2. A bung-bushing comprising an annulus adapted to lie within a bung-hole and carrying at its periphery a flange having a cutting edge to enter a groove in the edges of the abutting staves around the bung-hole, said groove being of a less depth than the width of the flange, a space being left between the edges of said staves and the periphery of the annulus, substantially as set forth.

3. In a device of the character described, an annulus carrying at its periphery a flange having a groove in its outer edge, said groove being substantially shallower than the width of the flange, in combination with a pair of abutting staves between which the annulus fits.

710,007. ELEVATOR. JOSEPH ESSE, Chicago, Ill., assignor of two-thirds to William H. Ready and William I. Ready, Chicago, Ill. Filed Apr. 8, 1901. Serial No. 54,894. (No model.)



Claim.—1. In an elevator the combination of a flexible strand or cable fixed against movement, a traveling sheave, gripping means operatively connected with said sheave and gripping said cable or strand, means for actuating said gripping means to cause the same to move along said cable or strand and impart motion to said sheave, a second sheave and a lifting-cable operatively related to said sheaves, substantially as set forth.

2. In an elevator the combination of a fixed cable or strand, a friction-grip engaging said cable or strand, means for actuating said grip to cause it to move along said cable or strand, a lifting-cable and means operatively connecting said lifting-cable with said friction-grip whereby a pull will be imparted to the lifting-cable by the movement of said grip along said strand, substantially as set forth.

3. In an elevator the combination of a fixed cable or strand, friction grip-wheels engaging said cable, means for rotating one of said wheels to cause the same to travel along said cable, a lifting-cable and means operatively connecting said lifting-cable with said friction-wheels for imparting a pull to said lifting-cable, substantially as set forth.

4. In an elevator the combination of a fixed cable or strand, a grip for said cable or strand comprising friction-wheels adapted to pinch the cable between them, means movable with said grip for rotating one of said wheels, a lifting-cable and means operatively connecting said lifting-cable with said grip whereby a pull will be imparted to the lifting-cable as the grip moves along said fixed cable, substantially as set forth.

5. In an elevator the combination of a fixed cable or strand, a pair of grip-wheels engaging the same on one side, a friction-wheel engaging said cable on the opposite side between said other wheels, means for elastically pressing said friction-wheel against the cable, means for rotating one of said wheels and thereby causing them to travel along said cable, a lifting-cable and means operatively connecting said lifting-cable with said wheels whereby a pull will be imparted to the lifting-cable as said wheels move along said fixed cable, substantially as set forth.

6. In an elevator the combination of a fixed cable or strand, traveling gripping means engaging said cable or strand and adapted to move therealong, means movable with said gripping means for operating the latter, a brake for arresting the operation of the last said means, a lifting-cable and means operatively connecting said lifting-cable with said gripping means whereby a pull will be imparted to the lifting-cable as the gripping means move along said fixed cable, substantially as set forth.

7. In an elevator the combination of a fixed strand or cable, gripping means movable therealong, a motor movable with said gripping means for actuating the same to move along said cable, a brake-wheel operatively connected with said motor, a brake for engaging said wheel, means continually tending to apply said brake, an electric device for releasing said brake, a lifting-cable and means operatively connecting said lifting-cable with said gripping means whereby a pull will be imparted to the lifting-cable as the gripping means move along said fixed cable, substantially as set forth.

8. In an elevator the combination of a carriage, a track or way upon which said carriage travels, a motor mounted on said carriage, fixed strands or cables passing said carriage on opposite sides of said motor, grip-wheels operatively connected with said motor and engaging both of said strands or cables for causing said carriage to move lengthwise of said strands or cables, a lifting-cable and means operatively connecting said lifting-cable with said carriage, substantially as set forth.

9. In an elevator the combination of a carriage, a track or way on which said carriage travels, a motor mounted on said carriage, cables or strands fixed with relation to said carriage and passing the same on opposite sides of said motor, grip-wheels operatively connected with the motor and engaging both of said cables or strands, a lifting-cable and means operatively connecting said lifting-cable with said carriage at a point between said first cables, substantially as set forth.

710,008. EJECTOR MECHANISM FOR REVOLVERS. JAMES D. ROSENTHAL, Norwich, Conn., assignor, by mesne assignments, to the Thames Arms Company, (Corporation,) Norwich, Conn. Filed Nov. 4, 1901. Serial No. 80,975. (No model.)

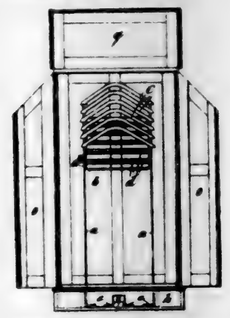
Claim.—1. In combination with the ejector-stem and frame of a hinged firearm, a cam for operating said stem and a spring mounted in said cam to lie on the outer edge thereof to be normally eccentric therewith, the said spring being formed with a shoulder adapted to engage the said frame, substantially as described.

2. In combination with the ejector-stem and frame of a hinged firearm, a cam for operating said stem having its edge cut away and a slit beyond the cut-away portion, and a spring having one end secured rigidly in said slit and its free end having an angular bend to engage the lower portion of the frame and a portion to extend beyond the said bend and lie in the cut-away portion, the said spring traversing the cut-away portion and disposed to lie normally eccentric with the edge of the cam, substantially as shown and described.

710,009. WARDROBE. LEMUEL ROBERTSON, Penarth, England. Filed Mar. 26, 1901. Serial No. 52,267. (No model.)

Claim.—1. In a wardrobe, a plurality of upwardly-extending oscillatory garment-supports arranged one in front of the other, having their lower ends mounted in the lower part of said wardrobe and each capable of being turned into a forward and backward position and means for normally holding said garment-supports in a vertical position, substantially as described.

2. A wardrobe having a hollow box-like lower portion, a plurality of upwardly-extending garment-supports arranged one in front of the other and having their lower ends mounted in bearings in said hollow lower portion of the wardrobe and capable of being turned into a forward or backward position, at will, and means for normally holding said garment-supports in the backward and upright position.



3. In a wardrobe, a plurality of upwardly-extending garment-supports arranged one in front of the other and having their lower ends journaled in the lower part of said wardrobe and each capable of being turned inward and outward, and means for holding each of said garment-supports in its vertical and inclined positions.

4. A wardrobe having a hollow lower portion the top of which is formed with transverse slots, a plurality of upwardly-extending garment-supports arranged one in front of the other and having their lower ends mounted to turn in said hollow lower portion and their upper portions extending through said slots and capable of being turned backward and forward therein, and means for holding said supports in a yielding manner in their normal position.

5. In a wardrobe, a plurality of normally vertical garment-supports arranged one in front of the other and each mounted at its lower end to turn about a horizontal axis, and springs adapted to hold each garment-support in position but so as to allow of its being pulled forward into an inclined position and of its being returned to the vertical position, substantially as described.

6. In a wardrobe, a plurality of normally vertical garment-supports made of different heights, arranged one in front of the other, supported at their lower ends on the lower portion or base of said wardrobe and capable of being turned inward and outward, means for limiting the extent of inward and outward motion of said garment-supports, and means for holding each of said garment-supports in its vertical and inclined positions.

7. A wardrobe having a hollow lower portion the top of which is formed with transverse slots, a plurality of normally vertical garment-supports arranged one in front of the other and of gradually-increasing height from front to back, each of said garment-supports having its lower end mounted in said hollow lower portion and its sides extending upwardly through said slots and capable of being turned inward and outward, and means for holding each of said garment-supports in the position into which it is moved.

8. In a wardrobe, a plurality of normally vertical garment-supports each comprising a frame mounted to turn about a horizontal axis at its lower end and provided at the top with a headpiece adapted to support a garment such as a coat and with one or more lower horizontal rods, and means for normally holding each of said garment-supports in a vertical position while allowing of its being tilted forward into an inclined position, substantially as described.

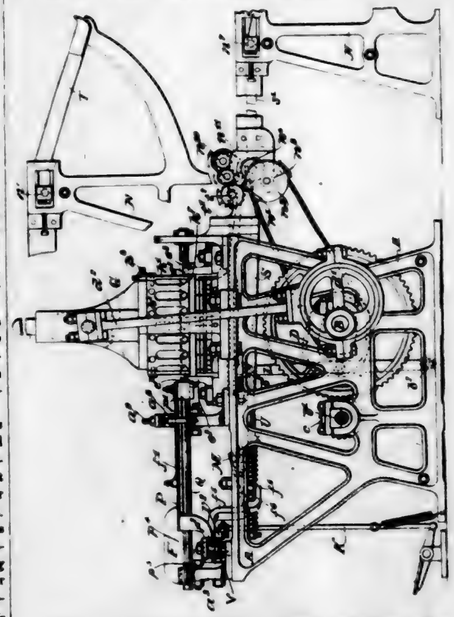
9. In a wardrobe, a plurality of normally vertical garment-supports each comprising a frame provided with one or more cross-rods, bearings in which the lower ends of said supports are mounted to turn about a horizontal axis, and springs engaging the lower ends of said garment-supports and adapted to hold the latter in a vertical position while allowing of their being pulled forward into an inclined position, substantially as described.

10. A wardrobe having a hollow lower portion that is arranged to move transversely in and out of said wardrobe, a plurality of upwardly-extending garment-supports arranged one in front of the other and having their lower ends supported on said movable lower portion and capable of being turned inward and outward, and means carried by said hollow lower portion for holding said garment-supports in position for use, substantially as described.

11. A garment-support having a hollow lower box-like portion that is arranged to move transversely in and out of the wardrobe and has its top formed with transverse slots, a plurality of garment-supports extending upwardly through said slots and having their lower ends mounted to turn in said box-like lower portion, and means for holding said garment-supports in position for use, substantially as described.

12. A wardrobe having folding doors at the front and a hollow box-like lower portion that is arranged to move transversely in and out of said wardrobe and formed with transverse slots in its top part, a plurality of garment-supports having their side members extending upwardly through said slots and their lower portions mounted to turn in said movable box-like lower portion and capable of being turned inward and outward in said slots, means for holding said garment-supports in position for use, and means connecting said movable lower portion of the wardrobe to the doors of said wardrobe and adapted to move the said lower portion outward and inward respectively when said doors are opened and closed, substantially as described.

710,010. COMBINED CUTTING AND COLLATING MACHINE. WILLIAM ROBERTSON and ANDREW ROBERTSON, Glasgow, Scotland. Filed Nov. 2, 1901. Serial No. 80,916. (No model.)



Claim.—1. A combined cutting and collating machine, comprising a supporting-frame to which is attached a rigid feeding-table with mirror and other registering guides, a set of spring-grippers adapted for being moved upon slide-rods, gripper slide-rods, a set of knives vertically fixed in "saw-gates" contained in adjustable bars, a set of plungers (fixed to a head-stock) adapted for being moved vertically between the knives, a head-stock for carrying a set of plungers fitted to vertical slide-rods, vertical slide-rods for the head-stock, a cam, spring-rod, slotted lever and other devices for operating the grippers, traveler webs and tray with trailer web or tube device and driving mechanism all substantially as and for the purposes herein described.

2. A machine for cutting up sheets of baked biscuits and collating the severed biscuits, comprising a supporting-frame, a rigid feeding table, registering guides thereon including a mirror, a set of spring biscuit-grippers, slide-rods upon which said grippers are movable, a set of saw-edged knives vertically fixed in "saw-gates" contained in adjustable bars, a set of plungers with "saw-gate" divisions adapted for fitting with precision between the knives, means to actuate said plungers, traveler webs and tray with trailer web or tube device and driving mechanism, substantially as described.

3. In a machine for cutting up sheets of baked biscuits, the combination of the registering devices comprising a perforated and ribbed feeding-table and a mirror permanently fixed beneath the said table and adapted for reflecting those parts of the embossed surface of a biscuit-sheet which cover the said perforations when the sheet is adjusted upon and to the ribs upon the perforated table, substantially as described.

4. In a machine for cutting up sheets of baked biscuits, the combination with two oppositely-placed fixed slide-rods, of two sets of oppositely-arranged grippers mounted upon said slide-rods and adapted for simultaneously gripping the two opposite margins of the sheet of baked biscuits, and means for simultaneously moving said grippers horizontally along the slide-rods, substantially as described.

5. In a machine for cutting up baked biscuits, the combination of a series of saw-edged knives vertically fixed in adjustable slotted bars and threaded together and through with tubes or bars, a series of plungers above said knives fitted with precision by saw-gate spaces to the knives, and means to move said plungers vertically between and out from the knives, substantially as described.

6. In a machine for cutting up sheets of baked biscuits, the combination of a set of stationary saw-edged cutting-knives, a series of rectangular plungers in size and shape like the said biscuits and their selvages, and means to move said plungers vertically with precision into and out from the said set of knives, substantially as described.

7. In a cutting-machine, the combination of two endless webs adapted for being moved upon rollers at different speeds; a slack web, tube or "trailer" obliquely suspended from a roller and a screw worm scraper adapted for being operated through a series of geared wheels all substantially as and for the purposes herein set forth.

8. In a cutting-machine, the combination of a slack web or tube obliquely suspended from a roller and adapted for being revolved by means of the said roller when the latter is in motion and for trailing upon the surface beneath it all substantially as and for the purposes herein set forth.

710,011. **COMBINED FERTILIZER-DISTRIBUTER AND SEED PLANTER.** WILLIAM B. ROEMER, Bay St. Louis, Miss. Filed June 19 1901. Serial No. 65,170. (No model.)

Claim.—1. In a device of the character described, the combination of a wheel-supported fertilizer-box having an upper forwardly-directed extension constructed to register with the rear end of a vehicle, and provided with means for loose connection with the vehicle, a seedbox located in rear of the fertilizer-box, brace connections between the two boxes, a cut-off for the fertilizer-box, a lever connected to the cut-off and mounted between the two boxes, and controlling means connected to the lever and projected forwardly to be under the control of the driver of the vehicle.

2. A device of the character described, embodying a front fertilizer-box, a seedbox located in rear of the fertilizer-box, brace connections between the two boxes, the fertilizer-box being provided with a forwardly-directed extension to register with the rear end of a vehicle and having means for loose connection therewith, a cut-off for the fertilizer-box, cut-off-operating means mounted between the two boxes, and a controlling device connected to said operating means and extended to be under the control of the driver of the vehicle.

3. The combination with a vehicle to contain fertilizer, of a fertilizer-distributer comprising a box having its front portion provided with vertical slots, and a bolt piercing the sides of the vehicle and passing through the slots to loosely connect the box to the vehicle.

4. A fertilizer-distributer having its fertilizer-box provided with a forwardly-extending member having its side walls provided with vertical slots, in combination with a vehicle having its side-boards each provided with an opening, and a bolt-rod passing through the openings in the side-boards and the slots in the fertilizer-box to hold the parts assembled.

5. A fertilizer-distributer having its fertilizer-box provided with a forwardly-extending member having its side walls provided with vertical slots, in combination with a vehicle having its side-boards each provided with an opening, a bolt-rod passing through the openings in the side-boards and the slots in the fertilizer-box to hold the parts assembled, and flexible means connecting the fertilizer-box with the vehicle.

6. The combination of a front-wheeled fertilizer-box, having a forwardly-directed extension to register with the rear end of a vehicle and having means for connection therewith, a seedbox located in rear of the fertilizer-box, brace connections between the two boxes, whereby the rear box is supported upon the front box, feed mechanism for the fertilizer-box in operative relation to the wheels thereof, a cut-off for the fertilizer-box, a controlling-lever mounted between the boxes and connected to the cut-off, a discharge-spout for the fertilizer-box, an opener carried by the front of the fertilizer-box and immediately in front of the spout, coverers carried by the rear of the fertilizer-box, feed mechanism for the seedbox in operative relation to the wheels of the fertilizer-box, and coverers carried by the rear of the seedbox.

7. In a device of the class described, the combination with a box or hopper, of a yoke pivoted to the front of the box, a furrow-opener carried by the yoke, and means carried by the front of the box for holding the shovel in engagement and out of engagement with the ground.

8. In a device of the class described, the combination with a box or hopper, of a yoke pivoted to the front of the box, an opener carried by the yoke, a keeper carried by the front of the box, and a rod detachably held within the keeper and projected at opposite ends across the yoke, the latter being capable of a vertical swing to positions above and below the rod, whereby the latter forms a stop to hold the opener in engagement and also out of engagement with the ground.

9. In a device of the character described, the combination with a wheeled box, of front and rear yokes pivoted to the fertilizer-box, coverers carried by the rear yoke, an opener carried by the front yoke, keepers upon the front and rear of the box, and rods detachably held within the respective keepers and projected at opposite ends beyond the respective yokes, the latter being capable of vertical movement to positions above and below the adjacent bars, whereby the said bars are adapted for holding the opener and coverers in engagement and also out of engagement with the ground.

10. In a device of the character described, the combination with a box or receptacle having its lower end provided with a contracted discharge-opening, of a pair of toothed feed and agitating rollers mounted beneath the discharge-opening, one of said rollers being yieldable toward and away from the other roller, and a cut-off located between the rollers and the discharge-opening.

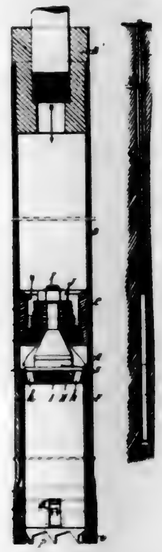
11. In a device of the character described, the combination with a box or receptacle having a contracted discharge-opening in its lower end, of a pair of toothed feed and agitator rollers mounted beneath the discharge-opening, one of the rollers being relatively fixed, and the other roller having slidable bearings which are movable toward and away from the relatively fixed roller, springs bearing against the slidable bearings to yieldingly force the movable roller toward the fixed roller, and a cut-off located between the rollers and the discharge-opening.

12. A fertilizer-distributer comprising a box or hopper having feed mechanism, and provided at its upper end with an offset forwardly-directed body extension constructed to fit within the rear end of a wagon-body and rest upon the bottom thereof after the end-gate has been removed, and carrying means for connection with the wagon-body.

13. A fertilizer-distributer, comprising a box or hopper having feed mechanism, and provided at its upper end with an offset forwardly-directed body extension provided with a closed front end, said extension being constructed to fit within the rear end of a wagon and rest upon the bottom thereof after the end-gate has been removed and carrying means for connection with the wagon to prevent separation therefrom, the front end of the extension forming an obstruction to prevent fertilizer being jolted from the wagon into the box or hopper.

14. A fertilizer-distributer, comprising a box or receptacle having feed mechanism, the upper front portion of the box being provided with an opening, a flat bottom projected forwardly from the lower edge of the opening, opposite upstanding sides rising from the bottom, an outer end also rising from the bottom, said bottom, opposite sides and front end forming a forward extension of the box to fit within the rear end of a vehicle, and means carried by the extension for connecting the same to a vehicle.

710,012. **BORING APPARATUS.** ADAM L. RONALDSON, London, England. Filed July 6, 1900. Serial No. 22,741. (No model.)



Claim.—1. In core-boring apparatus, means for arresting the flow of water through the core-barrel, consisting of a valve arranged to be moved longitudinally of the core-barrel by the pressure from the core to close, said valve having movement independent of the core-barrel for the purpose hereinbefore described.

2. In combination, the core-barrel, an inner core-tube and a valve, said valve and inner core-tube being connected and being movable upwardly under the action of the core independently of the core-barrel, substantially as described.

3. In core-boring apparatus, means for arresting the flow of water through the core-barrel, consisting of a valve, an inner core-tube connected to said valve, said core-tube being movable and closing the valve automatically when a core has been formed, an outer core-barrel, a valve-seat secured within said core-barrel, and a spring resting upon the valve-seat for supporting the inner core-tube, substantially as described.

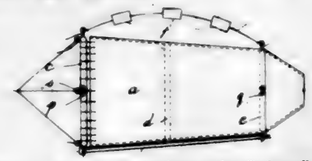
4. In core-boring apparatus, means for arresting the flow of water through the core-barrel, consisting of a valve closed by the core, said valve having a movement independent of the core-barrel, and means for gripping the core upon the flow of water being arrested, substantially as described.

5. In core-boring apparatus in combination, means for arresting the flow of water through the core-barrel by the action of the core, and means for gripping the core on such flow of water being arrested consisting of a movable inner core-tube, a ring mounted at the bottom of said inner core-tube and movable between the same and the core-barrel, said ring carrying spring core-grippers, said grippers being held back from contact with the core by the outer wall of the inner core-tube, substantially as described.

6. In core-boring apparatus in combination, means for arresting the flow of water through the core-barrel, and means for gripping the core on the flow of water being arrested consisting of a movable inner core-tube, a ring mounted at the bottom of said inner core-tube, carrying spring-grippers, said spring-grippers lying within vertical slots in the inner core-tube and carrying projections which engage upon the periphery of the inner core-tube to prevent the grippers engaging the core till the ring is caused to move downwardly.

7. In core-boring apparatus, in combination, automatically-operating means for arresting the flow of water through the core-barrel, said means comprising a valve having movement under the action of the core independent of movement of the core-barrel, means for gripping the core on such flow of water being arrested, said gripping means being normally retracted from the core-space and entering the core as the valve is operated, and means for adjusting the closure to the valve in relation to the gripping means when the core is formed.

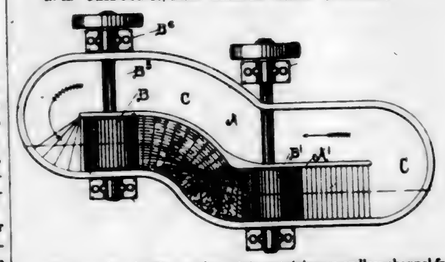
710,013. **OIL-DISTRIBUTING APPARATUS FOR CALMING WAVES.** ELIS SALVESEN, Grimstad, Norway. Filed Sept. 28, 1901 Serial No. 76,936. (No model.)



Claim.—1. In a device of the character described, a collapsible bag, a series of suitably-spaced annular rings of slightly-varying diameter secured to said bar, one of said rings being secured at the forward end and one at the rear end of said bag, said bag to the rear of said last-named ring having a contracted opening therein, lugs carried by the said rings, means secured to said lugs and extending in alinement with the length of said bag for preventing the bag from turning over on its longitudinal axis, and means connected to said forward ring for connection with the vessel, substantially as described.

2. In a device of the character described, a collapsible bag, a series of rings secured to said bag for retaining the same in an expanded conical shape, one of said rings being secured to the front end and one to the rear end of the bag, said bag having a tapering extension with an opening therein beyond said rear end of the bag, lugs secured to the rings on the under side thereof, a ballast-rod secured in said lugs and extending the length of the bag, swimmers carried by the said lugs, and means for connecting the bag to the vessel, substantially as described.

710,014. **BEATING-ENGINE.** ERNEST L. SAVAGE, Lancaster, N. H. Filed Feb. 17, 1902. Serial No. 94,404. (No model.)



Claim.—In a beating-engine, a tub containing an endless channel for the circulation of the paper-stock, a section of the channel being crooked to cause eddy-currents in the stream of stock, combined with two horizontal beating-cylinders acting in conjunction with suitable bed-plates and backfalls to beat the stock, the cylinders being placed one at each end of the crooked section of the channel the arrangement of the backfalls and the ratio of speed of the two cylinders being such as to cause the stock to flow rapidly through the crooked section of the channel, and slowly through the remaining portion of the channel, and with means for rotating the cylinders above and in close proximity to the bed-plates, substantially as described

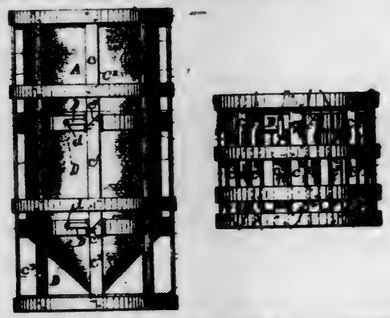
710,015. **SPECTACLE-FRAME.** FRANK SCHICK, St. Louis, Mo. Filed Nov. 2, 1901. Serial No. 80,881. (No model.)

Claim.—1. As an improved article of manufacture, an integral frame for spectacles, having a bridge with a joint on one side and integral upon the other side, lens-receiving openings formed by arms which project in opposite directions from each end of the bridge, said arms being covered at their ends, substantially as shown.

2. A spectacle-frame consisting of an integral piece having a bridge with a joint upon one side and integral upon the other side, lens-receiving openings formed by arms which project in opposite directions from each end of the bridge, lateral extensions on the ends of the arms, and

projections beyond said lateral extensions, the arms being secured at their ends, in combination with temples which are pivotally connected to the lateral extensions on the ends of the arms, substantially as shown.

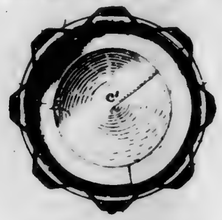
710,016. BANANA-SHIPPING CASE. FRANK SCHMITZ, Chicago, Ill. Filed Jan. 13, 1902. Serial No. 90,250. (No model.)



Claim.—1. The combination with a flexible bag, of an outer rigid crate secured thereto and out of contact therewith, said crate being divided longitudinally into a series of parts brought together and extended by relative rotation and provided with means for securing them in their extended position; substantially as described.

2. In a banana-shipping case, the combination with a flexible bag, of a crate secured thereto and out of contact therewith, consisting of a series of encircling hoops and longitudinal slats secured thereto, said longitudinal slats being divided obliquely, adjacent to certain of the hoops and provided with means for holding the portions end to end and for releasing them from this position so that they may slide one alongside of the other to shorten the crate for transportation; substantially as described.

710,017. BANANA-SHIPPING CASE. FRANK SCHMITZ, Chicago, Ill. Filed Jan. 22, 1902. Serial No. 90,735. (No model.)



Claim.—1. In a banana-shipping case, the combination with a suitable open crate, of an elastic tubular casing, a top and bottom therefor, a cord encircling said casing, and a second cord laced alternately over members of the crate and under the encircling cord; substantially as described.

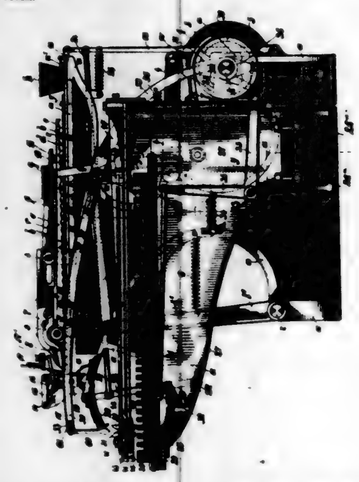
2. In a banana-shipping case, the combination with a suitable open crate, of conical top and bottom pieces suspended therein, and an elastic tubular casing secured around the bananas by means of an encircling cord, and centered in the casing by means of a cord laced alternately over the slats and under the encircling cord; substantially as described.

3. In a banana-shipping case, the combination with a suitable open crate, of an elastic tubular casing, a cord encircling the casing and adapted to hold it firmly in place about a bunch of bananas and a series of loops running from said encircling cord to the members of said crate and adapted to center the casing in the crate; substantially as described.

710,018. TOBACCO-CONVEYING DEVICE FOR CIGAR-BUNCHING MACHINES. JOSEPH B. SCHMITT, Oberrad, Germany. Filed Jan. 31, 1902. Serial No. 3,868. (No model.)

Claim.—1. The combination of the hopper *h*, exchangeable, channeled conveying-trough *b*, slide bars *d* and central elastic bar *g* serving to hold down the tobacco in the trough with yielding pressure, as described.

2. In a machine of the character described, the combination of a tobacco-conveying trough *b*; a pair of reciprocating compressing and feeding racks *o*; reciprocating feeding-arms 8, the forked arm 7 and link 9 connecting the feeding-arms 8 and racks *o*; suitable lever mechanism connected with the racks and feeding-arms, adapted to move them forward and backward above the trough; independent lever mechanism engaging the racks and adapted to raise and lower them; and connecting-rods *r*, on which the raising and lowering device oscillates, substantially as set forth.



3. In a machine of the character described, the combination of a tobacco-conveying trough *b* having a cross-section corresponding to the form of the bunches to be made, the compressing and feeding racks *o* and the feeding-arms 8 operating above the conveying-trough *b*, the connecting-rods *r*; the forked arm 7 and link 9 connecting feeding-arms 8 and racks *o*; levers 1′ suitably connected with the racks *o* and feeding-arms 8, means for oscillating said levers 1′, rods *t* suitably connected with the lever *u* and the other lever, and suitable mechanism for oscillating the lever *u*, substantially as and for the purpose set forth.

4. In a machine of the character described, the combination of a tobacco-conveying trough *b*; the levers 1′; the racks *o* journaled at one end to the levers 1′, the feeding-arms 8 formed with a rearwardly-projecting yoke portion 7, a rod or bar engaging the yoke portion 7, a link 9 connecting the feeding-arms 8 with the racks *o*, a yoke *p* mounted upon the feeding-racks *o*, a bar *q* engaging the yoke *p*, a link *r* connecting bar *q* with the rigid bar *s*, and suitable means for raising and lowering the bar *q*, substantially as and for the purpose set forth.

5. In a machine of the character described, the combination of a tobacco-conveying trough *b*, with a compressing and feeding rack *o*, means for reciprocating the rack *o*, and a spring-bar *g* engaging the tobacco in the trough to prevent its expansion, substantially as set forth.

6. In a machine of the character described, the combination of a tobacco-conveying trough *b*, with the plates *d*, and spring-bar *g*, adapted to prevent the expansion of the tobacco in the trough, the compressing and feeding racks *o* operating in trough *b*, the feeding-arms 8 operating in the trough *b* in front of the racks, and means for operating the racks and feeding-arms to cause them to operate successively upon the tobacco, substantially as set forth.

7. In a machine of the character described, the combination of a tobacco-conveying trough *b*, and means for compressing and feeding tobacco therein, with a retarding device comprising spring-pressed plates arranged at the outlet end of the trough to retain the tobacco while being cut, and a cutter operating at the end of the trough and adapted to sever the successive charges from the tobacco in the trough, substantially as set forth.

8. In a machine of the character described, the combination of a tobacco-conveying trough *b* and means for compressing and feeding tobacco therein, with the spring-pressed tobacco-retarding plates 13 arranged at the outlet end of the trough, the reciprocating cutter 17, and means operated by the cutter for raising the plates, substantially as set forth.

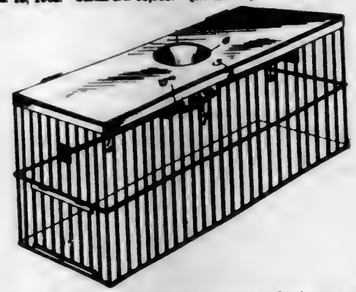
9. In a machine of the character described, the combination of a tobacco-conveying trough *b* and means for compressing and feeding tobacco therein, with the spring-pressed tobacco-retarding plates 13, arranged at the outlet end of the trough, the reciprocating cutter 17, the lever 15, supporting-plates 13, the bell-crank lever 18 engaging lever 15, and an adjustable device carried by cutter 17 and adapted to engage and operate lever 18, substantially as and for the purpose set forth.

10. The combination of a wrapping-table 20 and suitable means for applying the wrapper; a mold 26 for receiving the bunches after wrapping; the vertical rock-shaft 27, lever 28 and cam 29 for oscillating said shaft; the beam 40 mounted on said rock-shaft and receiving horizontal reciprocating movement therefrom; the headpiece 41 mounted on the free end of the beam 40; the rigid arm 42 mounted on the headpiece 41; the swiveled yoke 43 carried by the arm 43; the roller 44 mounted in the swiveled yoke 43; the lever 45 fulcrumed intermediately of its ends and bearing at one end against the roller 44 and at the other end against the end of the beam 40 and the catching-jaws 50, 51 operating to carry the wrapper-bunches from the wrapping-table to the mold, substantially as described.

710,019. PHOTOGRAPHIC EMULSION. TOBIAS SCHWARTZ, Hanover, Germany. Filed June 11, 1902. Serial No. 111,227. (No specimens.)

Claim.—A photographic emulsion, containing an emulsifying agent, silver phosphate, silver chlorate, and a silver salt of an organic acid, substantially as described.

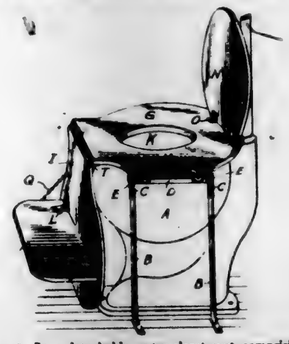
710,020. RAT-TRAP. BENJAMIN F. SHORT, Brantley, Ga. Filed Feb. 12, 1902. Serial No. 93,905. (No model.)



Claim.—1. The combination with a trap-casing having an opening in its upper end, of a shaft extending across the trap below the top thereof, a rotary cylindrical bait-holder carried by said shaft, and a funnel depending from said opening and having its smaller end in close proximity to the bait-holder, whereby the vision of the rodent will be directed and concentrated only to the bait-holder carried by said shaft, substantially as set forth.

2. The combination with the trap-casing having an opening in its upper end, and a funnel surrounding said opening, of a rotatable bait-holder journaled in said trap immediately below the funnel, substantially as set forth.

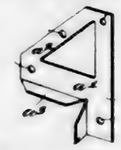
710,021. DETACHABLE WATER-CLOSET SEAT. HENRY M. SELVIDGE, Chicago, Ill. Filed Nov. 27, 1901. Serial No. 83,827. (No model.)



Claim.—1. In a detachable water-closet seat comprising a pair of legs or standards, a bracket adjustably secured to said legs or standards, a seat portion, a lid, a step-support and a step hingedly connected together, allowing the seat, lid, step-support and step to be compactly folded along the side of the closet-bowl, substantially as described.

2. In a detachable water-closet seat comprising a pair of legs or standards, a seat, a lid, a step-support and a step hingedly connected together and adapted to be folded along the legs or standards, the seat portion hingedly secured to a bracket, the bracket adjustably secured to slots in the legs or standards by means of thumb-screws, substantially as described.

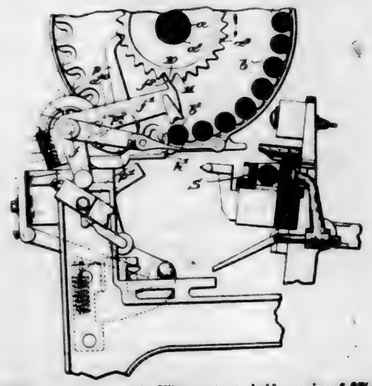
710,022. BRACE FOR SCREENS, BLINDS, &c. MILTON H. STEVENS, Waltham, Mass. Filed May 26, 1902. Serial No. 108,206. (No model.)



Claim.—1. A strengthening-brace for screens, blinds, &c., comprising a vertical portion, a horizontal part and an oblique part, integrally connected and adapted to lie flat against the material adjacent a corner of a blind or screen, the oblique part extending over the cross-bar or other member of the screen and lapping onto the upright thereof, and the vertical portion extending along the latter below the cross-bar, the lower edge of the horizontal part and the inner edge of the vertical portion being provided with inwardly-turned flanges extending substantially at right angles to each other for engaging the edges of the said cross-bar and upright.

2. A strengthening-brace for screens, blinds, &c., comprising a vertical portion, a horizontal part and an oblique part, integrally connected and adapted to lie flat against the material adjacent a corner of a blind or screen, the oblique part extending over the cross-bar or other member of the screen, and the vertical portion extending along the latter below the cross-bar, the lower edge of the horizontal part and the inner edge of the vertical portion being provided with inwardly-turned flanges extending substantially at right angles to each other for engaging the edges of the said cross-bar and upright, said vertical portion having provision for a fastening device at its lower end below said horizontal part, the latter having provision for a fastening device at the end adjacent said oblique part, and the upright having provision for another fastening device adjacent the opposite end of said oblique part.

710,028. FILLING-REPLENISHING LOOM. EDWARD S. STEPHENS, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Apr. 24, 1902. Serial No. 104,447. (No model.)



Claim.—1. A movable filling-feeder to hold a series of filling-carriers, a starter therefor, a transferrer, means controlled by transferring movement thereof to render said starter operative to effect initial movement of the feeder, and a device to positively complete the feeder movement as the transferrer resumes its normal position.

2. A movable filling-feeder to hold a series of filling-carriers, a starter therefor, a transferrer, means controlled by transferring movement thereof to render said starter operative to effect initial movement of the feeder, and a device to positively complete the feeder movement as the transferrer resumes its normal position and to positively lock the feeder between successive operations of the transferrer.

3. A movable filling-feeder to hold a series of filling-carriers, a starter therefor, a transferrer, means controlled by transferring movement thereof to render said starter operative to effect initial movement of the feeder, and a device movable with the transferrer to complete such feeder movement as the transferrer resumes its normal position.

4. A movable filling-feeder to hold a series of filling-carriers, means independent of the filling-carriers to normally lock the feeder from movement, a transferrer, operative movement thereof releasing the feeder from the locking means, and means controlled by such operative movement of the transferrer to immediately effect initial movement of the feeder when released.

5. A movable filling-feeder to hold a series of filling-carriers, means independent of the filling-carriers to normally lock the feeder from movement, a transferrer, operative movement thereof releasing the feeder from the locking means, and means, including a spring set by operative movement of the transferrer, to yieldingly start the feeder when unlocked.

6. A rotatable filling-feeder to hold a circularly-arranged series of filling-carriers, a transferrer, means movable therewith to normally lock the feeder from movement, and a starting device for the feeder, including a spring set by operative movement of the transferrer, to render the starting device operative to effect movement of the feeder when released from the control of the locking means.

7. A rotatable filling-feeder to hold a circularly-arranged series of filling-carriers, an attached toothed disk, a transferrer, means controlled by operative movement thereof to coöperate with said disk and start the rotative movement of the feeder, and an independent device movable with the transferrer to also coöperate with the disk and lock the feeder when the transferrer is in normal position.

8. A rotatable filling-feeder, means independent of the filling-carriers held thereby and movable with the transferrer to normally lock the feeder from movement, a transferrer to remove the filling-carriers one by one, and means controlled by operative movement of the transferrer to yieldingly start the movement of the feeder, such transferrer movement unlocking the feeder, return of the transferrer to normal position acting through the locking means to complete the feeder movement and positively lock it with the filling-carrier next to be removed in the path of the transferrer.

9. A rotatable filling-feeder to hold a plurality of circularly-arranged filling-carriers, an attached toothed disk, a coöperating pawl having a rocking and a bodily movement, a transferrer, a spring adapted when set to rock and move the pawl bodily to initiate rotation of the feeder, and means to normally lock the feeder, operative movement of the transferrer releasing the feeder from the locking means and also setting the spring.

10. A rotatable filling-feeder adapted to hold a series of filling-carriers, a disk notched to correspond to the position of the filling-carriers, a transferrer, a dog thereon to normally enter a notch of the disk and lock the feeder, and means, including an actuating-spring, rendered effective by operative movement of the transferrer, to impart initial movement to the feeder when the dog is withdrawn from the disk, return of the transferrer to normal position acting through the dog and disk to complete the movement of the feeder and to relax the actuating-spring.

11. A movable filling-feeder to hold a series of filling-carriers, a transferrer to engage and remove the latter one by one, means controlled by the transferrer to normally prevent movement of the feeder, a starter to initiate movement of the feeder, a normally inactive operating-spring for said starter and means governed by operative movement of the transferrer to render the spring active to effect the operation of the starter and start the feeder when free to move during such movement of the transferrer.

12. A movable filling-feeder to hold a series of filling-carriers, a transferrer to engage and remove the latter one by one, means controlled by the transferrer to normally prevent movement of the feeder, and means to overcome the inertia of the feeder when free to move, said means including a normally inactive spring and a starting-pawl, transferring movement of the transferrer releasing the feeder and also rendering the spring active to move the pawl and start the feeder during such movement of the transferrer.

13. A step-by-step rotatable holder adapted to contain a plurality of filling-supplies, a transferrer to remove the latter one by one, means to unlock the holder by transferring movement of said transferrer, and means actuated by the latter during such movement to effect rotation of the holder.

14. A rotatable holder to support a series of filling-supplies, an attached toothed disk, a transferrer, starting means actuated by and operating during transferring movement of the transferrer to effect initial rotative movement of the holder, and means actuated by and operating upon return movement of the transferrer to complete the movement of the holder, both of said means coöperating with the toothed disk.

15. A rotatable filling-supply holder, a transferrer to remove the filling-supplies singly therefrom, and means controlled by the transferrer to effect step-by-step movement of the holder and to lock it between successive operations of the transferrer, said means including a normally inoperative spring-acting member and a positively-acting member, coöperating alternately with the holder during the operating and return movement of the transferrer, both members coacting with the holder when at rest.

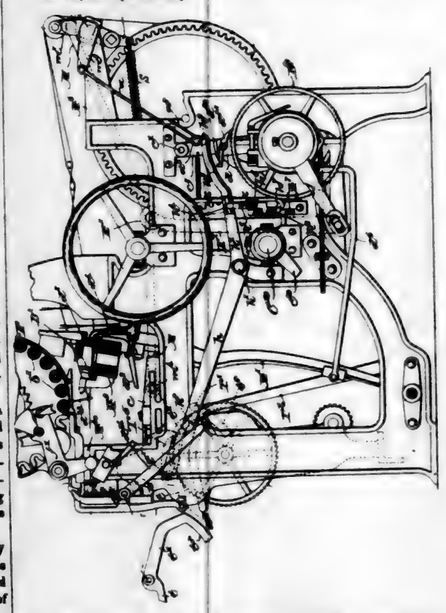
16. A movable filling-supply holder, a transferrer, and means to move the holder, said means including a normally quiescent pawl, and a spring interposed between the pawl and the transferrer, operative movement of the latter compressing the spring and acting through it upon the pawl to effect movement of the holder.

17. A movable filling-supply holder, a transferrer having a socketed extension, a spring seated therein, and means to move the holder, said means including a normally quiescent pawl having a tail extended in the path of the spring, operative movement of the transferrer moving the spring into engagement with and compressing it against the tail, the force of the spring when compressed moving the pawl to coöperate with and effect movement of the holder.

18. A rotatable filling-supply holder having an attached toothed disk, a pawl coöperating with the disk and having a tail, a transferrer provided with an extension, and a spring interposed between said extension and the tail of the pawl, operative movement of the transferrer compressing the spring and acting therethrough to yieldingly move the pawl to effect movement of the holder.

19. A rotatable filling-supply holder having an attached toothed disk, a pawl coöperating with the disk and having a tail, a transferrer provided with an extension, a spring interposed between said extension and the tail of the pawl, and a locking-dog on the transferrer, operative movement of the latter compressing the spring and therethrough causing the pawl to move the holder, return movement of the transferrer effecting engagement of the dog with the disk to lock the holder from movement.

710,024. LET-OFF-ARRESTING MECHANISM FOR LOOMS. EDWARD S. STEPSON, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Apr. 23, 1902. Serial No. 104,971. (No model.)



Claim.—1. In a loom, filling-replenishing mechanism, let-off mechanism, and means to temporarily arrest the operation thereof upon actuation of the replenishing mechanism.

2. In a loom, let-off mechanism, means operative by or through an abnormal condition of the filling to arrest the operation of said mechanism, and a device to release the latter from the control of said means after a predetermined number of picks.

3. In a loom, a controlling rock-shaft, let-off mechanism, means to turn said rock-shaft by or through an abnormal condition of the filling, and connections between said rock-shaft and let-off mechanism, to temporarily arrest the latter when the former is turned.

4. In a loom, filling-replenishing mechanism, let-off mechanism, means to arrest its operation when the replenishing mechanism is actuated, and a device to automatically release the let-off mechanism from the control of said means.

5. In a loom provided with automatic filling-replenishing mechanism, let-off mechanism including an actuating-pawl, means operated by or through actuation of the replenishing mechanism to render the pawl inoperative, said means including a locking-detent, and a device to act upon the detent and automatically release the let-off mechanism from control of said means after a predetermined number of picks.

6. In a loom, filling-replenishing mechanism, let-off mechanism, a controller-arm operated upon filling replenishing to render the pawl inoperative, a detent to engage and lock said arm at such time, to maintain the let-off inoperative, and a device to act upon the detent after a predetermined number of picks and release the controller-arm, to thereby restore the let-off to operative condition.

7. In a loom, let-off mechanism, means to arrest the operation thereof by or through an abnormal condition of the filling, and separate means to arrest the operation of said mechanism when the loom bangs off.

8. In a loom, let-off mechanism, including an actuating-pawl, a device to act upon and render it inoperative, and two separate means to actuate said device, one of said means being operative by or through an abnormal condition of the filling, and the other being operative when the loom bangs off.

9. In an automatic filling-replenishing loom, let-off mechanism, means to arrest its operation upon filling replenishing, and separate means to arrest the operation of said mechanism when the shuttle is improperly boxed.

10. In a loom, a movable whip-roll, let-off mechanism, including an actuating-pawl, means operative upon improper boxing of the shuttle to positively move the whip-roll to slacken the warps, and a device operative by such movement of the whip-roll to render the actuating-pawl inoperative and thereby arrest the let-off mechanism.

11. In a loom, a movable whip-roll, let-off mechanism, including an actuating-pawl, means operative upon improper boxing of the shuttle to positively move the whip-roll to slacken the warps, a controller-arm for the pawl, actuated by such movement of the whip-roll to engage and render the pawl inoperative, a detent to engage the arm and maintain it in engagement with the pawl, and a device to automatically release the controller-arm from the detent after a predetermined number of picks.

12. In a loom provided with automatic filling-replenishing mechanism, means to govern the time of operation thereof, take-up and let-off mechanisms, and separate controlling connections between said mechanisms and the said governing means, to arrest the take-up and let-off upon actuation of the replenishing mechanism.

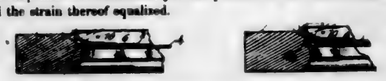
13. In a loom provided with filling-replenishing mechanism, means to govern the time of operation thereof, a movable whip-roll, means operative upon improper boxing of the shuttle to positively move the whip-roll and slacken the warps, let-off mechanism, including an actuating-pawl, a normally inoperative pivotally-mounted controller-arm for the pawl, having a cam-ledge, a locking-detent to coöperate with said cam-ledge when the controller-arm is moved to engage and render the pawl inoperative, separate connections between the said governing means and whip-roll and the controller-arm, to move the latter upon replenishment of filling or by movement of the whip-roll, to thereby render the let-off-actuating pawl inoperative, and a device to automatically act upon the detent and move it to release the controller-arm and permit it to return to inoperative position, the cam-ledge thereafter acting to hold the detent out of the path of movement of said device until the controller-arm is again moved and locked.

14. In a loom provided with automatic filling-replenishing mechanism, means to govern the time of operation thereof, take-up mechanism, including an actuating pawl and ratchet, and a device controlled by said governing means to disengage the pawl and ratchet upon operation of said governing means and maintain such disengagement during filling replenishing.

15. In a loom provided with automatic filling-replenishing mechanism, means to govern the time of operation thereof, take-up mechanism including an actuating pawl and ratchet, and a detent-pawl, and a device actuated by operation of said governing means to disengage the actuating-pawl from the ratchet and prevent reëngagement therewith until filling replenishment has been effected.

710,025. STRIP FOR SECURING GLASS PANES. JOSEPH SWARSEL, Redbank, N. J. Filed Dec. 4, 1901. Renewed Aug. 26, 1902. Serial No. 120,979. (No model.)

Claim.—1. As an article of manufacture, a fastening for glass panes, comprising a longitudinal strip of resilient material provided at one of its edges with a flange bent at an acute angle for the purpose of engaging a pane of glass, and bent at its other edge at a suitable angle for engaging the woodwork of the sash, and provided also with a resilient flat portion intermediate of its edges, the said flat portion having apertures for the passage of nails, the arrangement being such that substantially watertight joints are formed between said strip and said pane, and also between said strip and said woodwork, yet the pressure of the nails is cushioned and the strain thereof equalized.

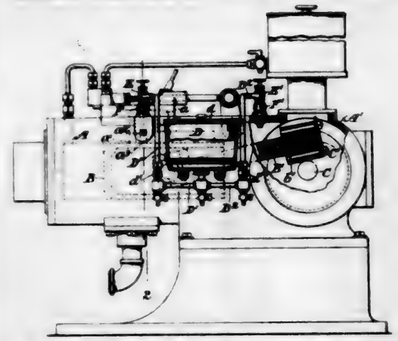


2. As an article of manufacture, a fastening for glass panes, comprising a longitudinal strip of resilient material provided at its edges with oppositely-disposed flanges, one forming substantially a right angle and the other forming an acute angle with the general position of said strip, said strip being provided with nail-holes placed intermediate of said edges where said strip is more or less strong.

3. As an article of manufacture, a fastening for glass panes, comprising a longitudinal strip of resilient material provided at one of its edges with a flange forming an acute angle with the general plane of said strip and provided at its other edge with a flange free to engage the woodwork of the sash, the arrangement being such that when said strip is placed loosely in position said acute angle may engage panes of different thicknesses, the difference in thickness being compensated by the angle assumed by said strip, and means for securing said strip in place.

4. As an article of manufacture, a fastening for glass panes, comprising a longitudinal strip of resilient material, provided at one of its edges with a flange forming an acute angle with the general plane of said strip, and provided at its other edge with a flange free to engage the woodwork of the sash, said strip being provided with a beveled end for abutting against the body of a similar strip disposed at right angles thereto.

710,026. LUBRICATOR FOR EXPLOSIVE-ENGINES. CARL W. WEISS, New York, N. Y., assignor of one-half to August Mieta, New York, N. Y. Filed Aug. 13, 1900. Serial No. 26,713. (No model.)



Claim.—1. The combination with an explosive-engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston, of an oil-receptacle, a conductor to deliver oil from said receptacle to a port in the cylinder-wall, said receptacle being below said port and said conductor terminating in said receptacle below the surface of the oil, and a vent from said port to said chamber whereby the flow of oil is induced by the partial vacuum in said chamber, substantially as shown and described.

2. The combination with an explosive-engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston, of an oil-receptacle, a conductor to deliver oil from said receptacle to a port in the cylinder-wall, said receptacle being below said port, and said conductor terminating in said receptacle below the surface of the oil, a check-valve in said conductor, and a vent from said port to said chamber whereby the flow of oil is induced by the partial vacuum in said chamber, substantially as shown and described.

3. The combination with an explosive-engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston, and a passage from said chamber to the working cylinder through a port adapted to be covered by the piston, of an oil-receptacle, a conductor to deliver oil from said receptacle to an oil-port in the cylinder-wall, said receptacle being below said port and said conductor terminating in said receptacle below the surface of the oil, and the vent from said oil-

port to the passage between the chamber and the air-port, substantially as shown and described.

4. The combination of an explosive-engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston, a pitman and a trunk-piston with an oil-opening therethrough, of an oil-receptacle, a conductor to deliver oil from said receptacle to an oil-port in the cylinder-wall, said receptacle being below said port and said conductor terminating in said receptacle below the surface of the oil, said port being in line with said oil-opening in the piston, and a vent from said oil-port to said chamber whereby the flow of oil is induced by the partial vacuum in said chamber, substantially as shown and described.

5. The combination with an explosive-engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston, of an oil-receptacle, a conductor to deliver oil from said receptacle to a port in the cylinder-wall, said receptacle being below said port, and said conductor terminating in said receptacle below the surface of the oil, a sight-glass in said conductor, and a vent from said port to said chamber whereby the flow of oil is induced by the partial vacuum in said chamber, substantially as shown and described.

6. The combination with an explosive-engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston and a passage from said chamber to the working cylinder through an air-port adapted to be covered by the piston, of an oil-receptacle, a conductor to deliver oil from said receptacle to an oil-port in the cylinder-wall, said receptacle being below said port, and said conductor terminating in said receptacle below the surface of the oil, a sight-glass in said conductor, and a vent from said oil-port to the passage between said chamber and the air-port whereby the flow of oil is induced by the partial vacuum in said chamber, substantially as shown and described.

7. The combination with an explosive-engine, of a receptacle for lubricating-oil disposed below the top of the cylinder and open to the atmosphere, a sight-feed above the cylinder, and connections between said receptacle, sight-feed and cylinder, whereby the oil is drawn from the receptacle under atmospheric pressure by the movements of the engine and the feed of the oil is stopped when the engine is stopped.

710,027. MACHINE FOR STRINGING TOBACCO-LEAVES. SAMUEL D. WHEELER, Powelstown, Ga., assignor of one-half to David H. Miller, Attapulgus, Ga. Filed June 2, 1902. Serial No. 108,937. (No model.)

Claim.—1. A machine of the class described comprising a frame having a bench and provided above the same with an upright guide, a slide mounted in the guide and capable of upward and downward movement in the guide and provided with an upright needle having means for engaging thread, means for supporting the needle in an elevated position, and means for supporting a thread in the path of the needle, whereby the thread will be carried through the stems by the downward movement of the slide, substantially as described.

2. A machine of the class described comprising a frame, a vertically-movable slide mounted on the frame and provided at its bottom with a depending needle having a board for engaging thread, a tray adapted to receive the leaves and provided with means for holding the same in position, and means for supporting a thread in the path of the needle, whereby the thread will be carried through the stems by the downward movement of the slide, substantially as described.

3. A machine of the class described comprising a frame, a slide mounted in the frame and provided with a projecting handle or arm, a needle carried by the slide, a pulley located above the slide, a flexible connection arranged on the pulley and attached to the slide, means arranged to be engaged by the flexible connection for supporting the needle in an elevated position, and a tray for holding the leaves, substantially as described.

4. A machine of the class described comprising a frame having a bench or support and provided with uprights having shoulders located above the bench or support, a slide, a thread-holder mounted on the frame and located above the shoulders, and a needle carried by the slide and provided with a recess located in alinement with the said shoulders when the slide is elevated, substantially as described.

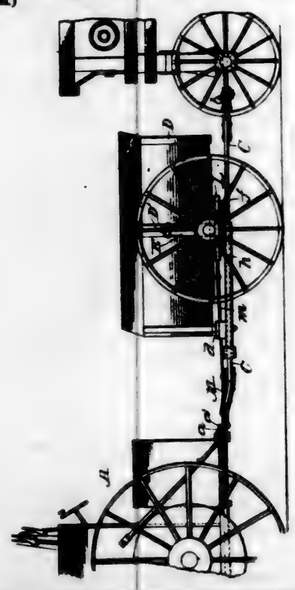
5. A machine of the class described comprising a frame having a support provided with an opening at its rear end and having a stud or projection at its front portion, a slide mounted on the frame above the support and provided with a needle, and a tray provided with means for holding the leaves and having openings to register with the opening of the support and to receive the projection thereof, substantially as described.

6. A machine of the class described comprising a frame having the support, a vertically-movable needle provided with a board for engaging thread, means for operating the needle, a tray adapted to receive the leaves and provided at the back with means for engaging the stems, and for supporting the latter in a vertical series beneath the needle, and means for supporting a thread in the path of the needle, whereby the thread will be carried through the stems by the downward movement of the slide, substantially as described.

7. In a machine of the class described, the combination with a frame, a needle, and means for operating the latter, of a tray adapted to receive the leaves and provided with a clamp composed of an upwardly-extending rigid jaw, a movable jaw arranged adjacent to the rigid jaw, and a locking device mounted on the tray and engaging the movable jaw, substantially as described.

8. In a machine of the class described, the combination with a frame, a needle, and means for operating the same, of a tray adapted to receive the leaves and provided with a clamp composed of an upwardly-extending rigid jaw, an upwardly-extending movable jaw pivoted to the tray and provided at its upper portion with a notch, and a pivoted dog mounted on the tray and engaging the shoulder formed by the notch, substantially as described.

710,028. TENDER FOR TRACTION-ENGINES. FRANK J. WOOD, Des Moines, Iowa. Filed Aug. 13, 1902. Serial No. 119,504. (No model.)



Claim.—1. In a tender for traction-engines, a body-supporting frame mounted on an axle constructed to provide an unobstructed opening between the upper and lower members of said axle, in combination with a draw-bar the size thereof being such that it may be passed through the axle and be movable therein without moving the tender, substantially as shown and for the purpose set forth.

2. In a tender for traction-engines, a rigidly-connected axle and body-supporting saddle, uprights journaled between the axle and saddle each upright having a spindle and an arm, the arm of one upright projecting rearward and that on the other upright forward, a disk between the axle and saddle, bars attached to the disk and to the arms on the uprights, and means for connecting the disk to the traction-engine, substantially as shown.

3. In a tender for traction-engines, an axle made up of two connected members, bars attached between the members of the axle and maintained at right angles thereto, a body-supporting saddle carried by the axle, uprights journaled between the ends of the axle and the supports for the saddle, a spindle and an arm on each of the uprights, a disk mounted centrally on the axle between the axle and saddle, links between each arm and the disk, flexible connections attached to the disk, and rods attached to the flexible connections for engagement with the traction-engine, substantially as shown and for the purpose set forth.

4. In a tender for traction-engines, the combination with a trussed axle having an open central portion, saddle and wheel supporting fixtures on the axle, pivotal uprights between the ends of the axle and the fixtures, spindles and arms integral with the uprights, a disk journaled between the axle and saddle, links which extend from the arms to the disk, and means for connecting the disk to the steering-wheel supports of the traction-engine, substantially as set forth.

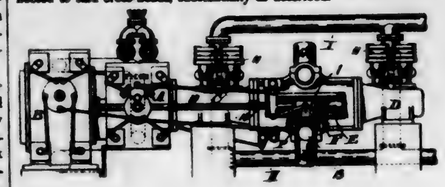
710,029. WATER-WHEEL. ROBERT E. WOOLMAN, St. Joseph, Mo. Filed Sept. 25, 1901. Serial No. 76,490. (No model.)

Claim.—A water-wheel comprising horizontal annular supports arranged one above the other, vertical supports attached to the annular supports at points upon their inner peripheries, the ends of said supports being taken inwardly and upwardly toward the axis of the wheel, a conical bearing-block attached to the upper ends of the vertical supports, a bearing-cap disposed above the conical bearing-block, said conical bearing-block and bearing-cap having perforations therethrough, a shaft passed through the perforations and rigidly attached to the conical bearing-block, balls disposed between the conical bearing-block and the bearing-cap, a sleeve encircling the shaft and of inner length than the shaft, disposed against the under side of the conical bearing-block and extending to a point in the center and slightly below the plane of the lowermost annular support, a second conical bearing-block disposed against the lower end of the sleeve and rigidly mounted upon the lower end of the shaft, a second bearing-cap disposed below the second-named conical bearing-block, balls disposed between the conical bearing-block and the bearing-cap, horizontal rods attached at their inner ends to the sleeve and at their outer ends to the vertical supports, the uppermost and lowermost rods being passed through the vertical supports and the annular supports to hold them together, and wings pivotally attached to the horizontal rods with the exception of the lowermost of said rods by means of loops upon their upper edges, said wings having their lower edges disposed below the horizontal rod next below.

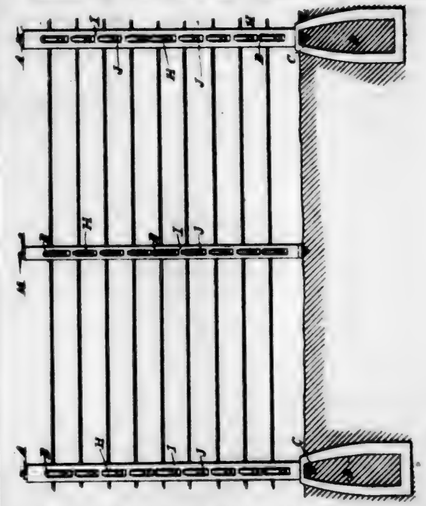
710,030. PUMP. CHARLES G. WORTHINGTON, Dunellen, N. J. Filed Aug. 28, 1900. Serial No. 27,781. (No model.)

Claim.—1. A direct-acting steam-pump having separate chambers for the opposite ends of the pump, a cross-head between said chambers with the plungers for the opposite pump ends on opposite sides of the cross-head, connections from the steam pistons or pistons to said cross-head, and compensating mechanism connected to said cross-head, substantially as described.

2. A duplex direct-acting steam pumping-engine having separate chambers for the opposite ends of the pump, a cross-head between said chambers on each side of the pump with the plungers for the opposite ends of the pump on opposite sides of the cross-heads, connections from the steam-pistons to said cross-heads, and compensating cylinders connected to said cross-heads, substantially as described.



710,081. FENCE-POST AND FENCE-STAY. VIRGIL H. ABBOTT, Carrollton, Ky. Filed Mar. 19, 1902. Serial No. 98,081. (No model.)



Claim.—1. In a device of the type set forth, the combination with a base, of a post secured thereto and having a series of horizontally-disposed notches extending entirely across the outer face of the post, the said outer face of the post being flat and carrying a series of teeth centrally arranged and inclined slightly in an upward direction with their engaging faces in alinement with said notches, a face-plate having a flat inner face and provided with apertures to receive said teeth, said face-plate being clamped to the post and having its inner face contacting with the outer face of the post throughout, with separate means for clamping the face-plate to the post.

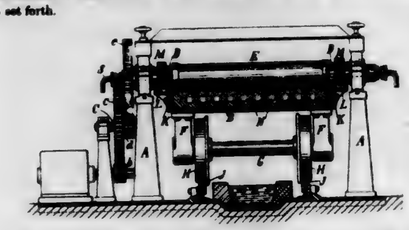
2. In a device of the type set forth, the combination with a base, of a post having a flat outer face secured thereto, teeth centrally arranged on said face of the post, with horizontally-disposed notches on the outer face of the post extending entirely thereacross and located at the junction of the teeth and the post, to receive the strands of wire, and a face-plate having a flat inner face and provided with apertures to receive the teeth, with bolts and nuts for securing the inner face of the face-plate in contact with the outer face of the post throughout, substantially as described.

710,082. MACHINE FOR MAKING GLASS PLATES. LEON APPERT, Paris, France, assignor to the Appert Glass Company, a Corporation of New Jersey. Filed Feb. 6, 1901. Serial No. 46,167. (No model.)

Claim.—1. In a machine for rolling glass plates, the combination with one or more rolls and a table for receiving glass, of a fluid-circulating system arranged to be employed for cooling the said table, having its inlet arranged relatively close to the central portion of the table upon which the molten glass is poured, and its outlet relatively far from such portion, substantially as and for the purposes set forth.

2. In a machine for rolling glass plates, the combination with one

or more rolls, of a table for receiving the glass to be acted on by the rolls, and provided with channels or passages in its bed for the circulation of water, said channels having inlets at the center line or section of the table and outlets at the sides, whereby the water in passing through the channel is caused to flow from the center of the table toward its sides, as set forth.



3. In a machine for rolling glass plates the combination with one or more rolls mounted on stationary bearings, of a longitudinally-movable table, having channels or passages in its bed, with inlets at the center line or section of the table and outlets at the sides, and flexible connections between the inlets and a source of water-supply, as set forth.

710,033. APPARATUS FOR THE COMBUSTION OF FINELY-DIVIDED SOLID FUEL. JOHN W. BAILEY, Jersey City, N. J. Filed Jan. 18, 1901. Serial No. 43,680. (No model.)

Claim.—1. The combination, of a burner-tube; a plug arranged within the same, to afford a free interspace between the proximate surfaces of the plug and the burner-tube; an air-blast pipe communicating with the interior of the burner-tube; means for supplying pulverized solid fuel to said interspace; a water-pipe running longitudinally through said plug and having a discharge-orifice within the discharge-orifice of the burner-tube; and an air-pipe, surrounding said water-pipe and having a discharge-orifice adjacent to the discharge-orifice of the water-pipe, the interior of said air-pipe communicating with the interior of the burner-tube, substantially as set forth.

2. The combination, of a burner-tube having an internally-tapering portion; a tapering plug arranged within the same to afford a free interspace between the proximate surfaces of the plug and burner-tube; means for adjusting said plug longitudinally with relation to the burner-tube; means for supplying pulverized solid fuel to the interspace between said plug and burner-tube; an air-blast device communicating with the interior of the burner-tube; and means for diffusing watery vapor within the region of discharge of the burner, substantially as set forth.

3. The combination, of a burner-tube; a plug arranged within the same, to afford a free interspace between the proximate surface of the plug and the burner-tube; an air-blast pipe communicating with the interior of the burner-tube; means for supplying pulverized solid fuel to said interspace; a water-pipe running longitudinally through said plug and having a discharge-orifice within the discharge-orifice of the burner-tube; an air-pipe surrounding said water-pipe and having a discharge-orifice adjacent to the discharge-orifice of the water-pipe, the interior of said air-pipe communicating with the interior of the burner-tube; and means for adjusting said air-pipe longitudinally with relation to the water-pipe, substantially as described.

4. The combination of a burner having a definite annular discharge-orifice and an interior chamber communicating with said orifice; means for supplying pulverized solid fuel to said chamber; means for supplying to said chamber an air-blast adapted to project said solid fuel through said orifice; means for regulating said air-blast; means for supplying and discharging watery vapor within the area surrounded by said annular orifice; means for regulating said watery-vapor discharge; means for supplying and discharging a distinct air-blast within the area surrounded by said annular orifice; and means for regulating said last-mentioned air-blast, substantially as and for the purposes set forth.

5. The combination of a burner-tube; a plug of less diameter arranged therein to afford an annular interspace and discharge-orifice; means for supplying pulverized solid fuel to said interspace; means for regulating said supply of solid fuel; means for supplying an air-blast to said interspace; means for supplying and discharging watery vapor within the area surrounded by said annular orifice; means for regulating said discharge of watery vapor; means for supplying and discharging a distinct air-blast within the area surrounded by said annular orifice; and means for regulating the said air-blasts, substantially as and for the purposes set forth.

710,034. PAPER-ROLL HOLDER. WILLIS H. BELKNAP, Summit, N. J. Filed Oct. 11, 1901. Serial No. 78,361. (No model.)

Claim.—1. In a paper-roll holder, a bracket having perforated arms, a roller mounted for rotation between said arms having a central opening therein and a slot, a single continuous rod to insert in said central opening and the perforations in the arms, and means for preventing the withdrawal of said rod, substantially as shown and described.

2. In a paper-roll holder, a roller having a longitudinal bore therethrough, a bracket having perforated arms, a single continuous rod for engaging the holes in said arms and the bore in the roller, said rod and roller being adapted to rotate between said arms, and means for preventing the withdrawal of said rod, substantially as shown and described.

3. In a paper-roll holder, a roller having a longitudinal bore therethrough, a slot connecting said bore and the surface of the roller, a bracket having perforated arms, a rod to fit in the holes in said arms and the bore in the roller, and a spring-actuated catch on said rod adapted to fit in said slot, said rod and roller being adapted to rotate between said arms, substantially as shown and described.

4. In a paper-roll holder, a bracket having perforated arms, a roller having a longitudinal central bore, a single rod inserted through the perforation in one of the arms, the bore in the roller, and the perforation in the other arm, the projecting ends of said rod forming trunnions on which said roller rotates, and means to prevent the withdrawal of said rod, substantially as shown and described.

5. In a paper-roll holder, a bracket having perforated arms, a roller having a longitudinal central bore, holes cut into said roller intersecting said bore, and a slot connecting said holes, a rod inserted in the perforations in said arms and the bore in said roller, and a catch to prevent the withdrawal of said rod adapted to fit into said slot and register with one of said holes at times, substantially as shown and described.

6. In a paper-roll holder, a roller having a longitudinal bore therethrough, triangular holes cut into said roller and intersecting said bore, a slot connecting said holes, a bracket having perforated arms, a rod to fit in the holes in said arms and the bore in the roller, and a catch on said rod adapted to fit in said slot and register with one of said triangular holes at times, substantially as shown and described.

7. In a paper-roll holder, a base-plate provided with screw-holes to receive screws for fastening it to a support, perforated side arms extending outwardly from said plate, a roller having a longitudinal bore therethrough, triangular holes cut into said roller intersecting said bore, a slot connecting said holes, a rod for engaging the holes in said side arms and said bore, and a catch adapted to engage said slot and register with one of said triangular holes at times, substantially as shown and described.

8. In a paper-roll holder, a bracket having perforated arms, a roller having a longitudinal central bore, triangular holes cut into said roller intersecting said bore, and a slot connecting said triangular holes, a rod inserted in the perforations in said arms and the bore in said roller, a slot in said rod, a catch pivoted in said slot and held normally out of line of the surface of said rod by a spring, a pin inserted in said rod across said slot, and a projection on the base of said catch to engage said pin, said catch adapted to engage said slot and to register with one of said triangular holes at times, substantially as shown and described.

710,035. ADJUSTABLE ROCKING-CHAIR. CARL A. BERGSTROM, Tacoma, Wash. Filed Jan. 10, 1902. Serial No. 89,130. (No model.)

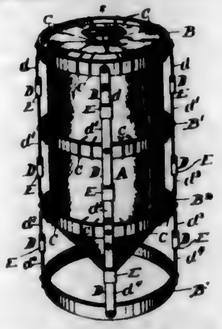
Claim.—1. A rocking-chair having a pivotal connection of the rear legs with the rockers and having adjustable front legs.

2. A rocking-chair having in combination with the rockers and legs, an extensible or adjustable connection between the rockers and the front legs and a pivotal connection between the rockers and the rear legs.

3. In a rocking-chair the combination with a seat and rockers, of a pivotal connection interposed between the seat and rockers at one side of a median line of said seat, and an adjustable connection interposed between said seat and rockers at the other side of such median line of said seat.

4. The combination with a hollow base-piece having a shoe for attachment to a rocker of a chair, of a socket to receive a front leg of the chair provided with an extension arranged and adjustable in the base-piece.

710,036. BANANA-SHIPPING CASE. HARRY BUTLER, Berwyn, Ill., assignor to Frank Schmitz, Chicago, Ill. Filed Jan. 18, 1902. Serial No. 90,257. (No model.)

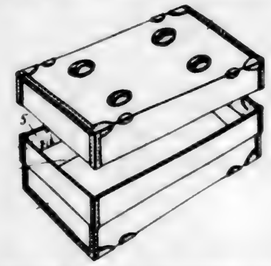


Claim.—1. In a banana-shipping case, the combination with a flexible sack, of a crate surrounding the same and secured thereto, out of contact therewith, said crate being made up of a series of encircling hoops and a series of longitudinal braces divided into portions pivoted together and to the hoops and provided with adjustable means for locking the joints against angular movement to prevent the collapse of the case; substantially as described.

2. The combination with the flexible sack, A, of an encircling supporting-crate surrounding the same and secured thereto, out of contact therewith, said crate being made up of a series of encircling hoops, B, B', B², and the braces, D, composed of intermediate portions, d', d^2, pivoted between their ends, to the intermediate hoops and at one end to each other, and end portions, d, d^1, pivoted at one end to the adjacent ends of the intermediate portions and at the other end to the end hoops, said braces being provided with the slides, E, to lock the joints against movement; substantially as described.

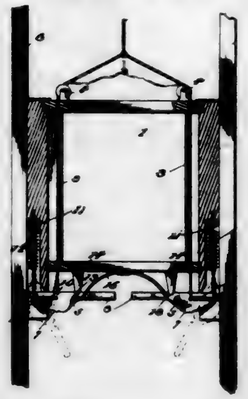
710,037. TELESCOPING VALISE. CHARLES A. BODWELL, Jr., Lakeville, Cal. Filed June 2, 1902. Serial No. 109,867. (No model.)

Claim.—1. A telescoping valise, one portion of which comprises two sections, each rectangular in form and having substantially rigid sides, the outer section telescoping snugly over the inner section, and a web of flexible material extending around the whole periphery of each section, one edge of which is secured to the inner section throughout its whole periphery to make a dust-proof joint, and the other edge of which is secured to the outer section throughout its whole periphery to make a dust-proof joint, said web being of such width and attached to the inner and outer sections at such heights throughout as to permit and to limit the movement of the outer section relatively to the inner section through substantially the height of said inner section, substantially as described.



2. A telescoping valise, one portion of which comprises two sections, each rectangular in form and having substantially rigid sides, the outer section telescoping snugly over the inner section and a web of flexible material extending around the whole periphery of each section, the lower edge of which is attached to the top of the inner section, and the inner edge of which is attached to the top of the outer section, each of such attachments being dust-proof and extending around the entire periphery of the section, substantially as described.

710,038. SAFETY-ELEVATOR. PHILIP H. BURGART, Payne, Ohio. Filed May 23, 1902. Serial No. 108,558. (No model.)



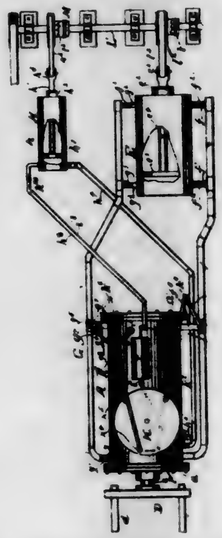
Claim.—1. In an elevator and in combination with the car, a dog mounted for pivotal and sliding movement, a spring for exerting an upward pull upon the outer end of the dog, a second spring for exerting a downward pressure upon the inner end of said dog, and restraining means exerting a force upon the dog at a point intermediate of the two springs for normally holding the dog out of action against the tension of the said springs, substantially as set forth.

2. In an elevator, and in connection with the car, a dog mounted for pivotal and sliding movement, a stud adapted to interlock with the dog and limit its movement in one direction, a spring for throwing the dog outward and upward into operative position, a second spring for disengaging the dog from the said stud, and restraining means for holding the dog out of action against the tension of the two springs, substantially as set forth.

3. In an elevator, and in combination with the car having a side portion recessed, a dog comprising a cam and stem portions, the cam portion having a longitudinal slot and the stem portion having a notch, a spring located in the recess of the car and exerting an upward pull upon the dog, a stud for limiting the upward movement of the dog at its inner end and adapted to enter the notch thereof, a second spring normally exerting a downward pressure upon the inner end of the dog to effect a dis-

engagement thereof from the stud, a pin forming a pivotal and slidable support for the dog, and restraining means for normally holding the dog out of action against the tension of both of said springs, substantially as set forth.

710,089. HYDROSTATIC PRESS. WILLIAM D. BOYD, Kansas City, Mo. Filed Aug. 30, 1901. Serial No. 73,830. (No model.)



Claim.—1. In a hydrostatic press, press-cylinder and its piston, said cylinder having separate induction and eduction openings upon opposite sides and at each end and normally closed openings for the supply of fluid to the cylinder, a double-acting suction and forcing pump having eduction and induction openings upon the respective opposite sides and at the forward and rear ends, separate suction and supply conductors for the fluid on opposite sides of said press-cylinder and the said double-acting suction and forcing pump and closed at one end, branch pipes connected with said fluid suction and supply conductors and also with the respective eduction and induction openings to said pump, and branch pipes connected with the suction and supply conductors, and also with the respective induction and eduction openings to said press-cylinder, means for operating said pump, and three-way valves in the supply and suction pipes at the junction of the branch pipes communicating with the rear end of the press-cylinder, and means for operating said valves automatically.

2. In a hydrostatic press, press-cylinder and its piston, said cylinder having separate eduction and induction openings upon opposite sides and at its forward and rear ends and normally closed openings for the supply of the fluid to the cylinder, a double-acting suction and forcing pump having separate eduction and induction openings upon opposite sides and at its forward and rear ends, means for operating said pump, separate suction and supply conductors on opposite sides of the press-cylinder, and said pump closed at one end, branch pipes connected with the respective eduction and induction openings to said press-cylinder and the forward ends of the respective suction and supply conductors, and branch pipes connected with said rear ends of said suction and supply conductors and the respective eduction and induction openings to said pump, three-way valves in the suction and supply conductors, at the junction of the branch pipes leading to the rear end of the press-cylinder, and valve-stems to said valves, means for operating said valve-stems and said three-way valves simultaneously, and a high-pressure pump and its conductor connected with the press-cylinder.

3. In a hydrostatic press, the combination with a press-cylinder having duplex eduction and induction openings upon opposite sides, and with the piston of a piston rod or plunger, a compressing-plate, a double-acting low-pressure suction and forcing pump having duplex eduction and induction openings upon opposite sides, and separate suction and supply pipes on each side of the said press-cylinder extending upon both sides of said pump and connected with the respective duplex induction and eduction openings to said press-cylinder and said pump, means for supplying said press-cylinder and said pump with fluid, and a high-pressure pump having induction and eduction openings, and pipes connected therewith, one of which is connected with the eduction-opening to said pump and provided with a check-valve adjacent thereto, and also connected with the rear end of the press-cylinder, and the other pipe being connected with the induction-opening to said force-pump and also connected with the front end of said press-cylinder, a check-valve in said pipe, means for operating said low-pressure and high-pressure pumps alternately, and three-way valves in the suction and supply pipes to the press-cylinder.

4. In a hydrostatic press the combination with a press-cylinder having duplex induction and eduction openings at the forward and rear ends, a piston and a piston-rod, branch pipes connected with said duplex induction and eduction openings, and suction and supply pipes on opposite sides of the cylinder connected with the branch pipes, three-way valves in the suction and supply pipes at the junction of the branch pipes leading to the rear end of the press-cylinder, crank-rods connected with said three-way valves, means for forcing the fluid in the supply and drawing of the fluid from the press-cylinder, a pivoted disk on the press-cylinder, rods pivotally connected therewith, and also with the crank-rods operating said three-way valves, a fluid-operated cylinder on the press-cylinder, a piston and a piston-rod eccentrically connected with said disk, a spring acting to force the piston in one direction and a fluid-pipe connected with the other end, and means for forcing the fluid through said pipe.

5. The combination in a hydrostatic press with the press-cylinder having duplex induction and eduction openings at the forward and rear ends of a piston a piston-rod and a compressing-plate, a double-acting suction and forcing pump having duplex induction and eduction openings, separate suction and supply pipes upon each side of said press-cylinder and extending upon each side of said pump, branch pipes connected with the said suction and supply pipes and with the duplex eduction and induction openings to said press-cylinder and said pump, check-valves in the branch pipes leading to said pump and three-way valves in the suction and supply pipes at the junction of the branch pipes leading to the rear end of the press-cylinder, and crank-rods operating said valves, a valve-releasing cylinder on the press-cylinder having a leak-opening, a piston and a piston-rod, a spring within said cylinder actuating said piston in one direction, and a high-pressure-fluid-forcing pump and a conductor of the fluid connected with said pump and also with said valve-releasing cylinder upon the opposite side of the piston having said spring, and a check-valve in said conductor, a separate pipe leading from the induction-opening to said pump to the forward end of the press-cylinder, a disk on the press-cylinder and rods pivotally connected therewith and also pivotally connected with the crank-rods operating the three-way valves, and means substantially as described for operating said double-acting and said high-pressure pumps alternately.

710,040. WRENCH. THOMAS H. GAHLL, Terra Alta, W. Va., assignor of one-half to William F. Dailey, William Bishop, and Charles A. Miller, Terra Alta, W. Va. Filed Jan. 23, 1902. Serial No. 90,994. (No model.)

Claim.—1. The improvement in wrenches herein described comprising the handle having a mortise for the butt of the adjusting-key, the shank having a fixed jaw and provided with the longitudinal groove for the adjusting-key, the sliding jaw, the locking-bar having a groove in its inner side coinciding with that in the shank and provided at its ends with projecting tenons engaging with the handle and the fixed jaw, and the adjusting-key operating in the grooves of the locking-bar and of the shank and having its butt-end operating in the handle and provided with a thumb-piece, and the spring for actuating said key substantially as set forth.

2. The combination of the handle, the shank having the fixed jaw, the sliding jaw, the locking-bar hold at its ends to the handle and to the fixed jaw, and the key operating between the locking-bar and the handle and having in rear of the locking-bar a projection or thumb-piece operating in a recess in the handle substantially as set forth.

3. A wrench comprising the handle, the shank, the fixed jaw, the sliding jaw, the locking-bar arranged for adjustment to engage the sliding jaw and held loosely at one end to the fixed jaw and at its other end to the handle and the sliding key bearing between the shank and locking-bar and extended at its rear end within the handle beyond the rear end of the locking-bar substantially as set forth.

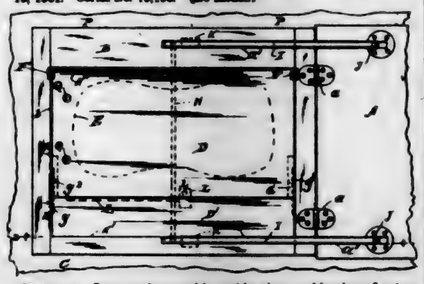
710,041. DEVICE FOR LIFTING METAL PLATES. BYRON B. CLARK, 2nd, Chicago, Ill. Filed May 13, 1901. Serial No. 59,967. (No model.)

Claim.—1. The combination with a lifting-magnet, of a yoke secured thereto and having an upper curved portion above the magnet, an inclined portion and a lateral curved portion, and a movable shackle engaging with the yoke for facilitating the operation of handling metal plates, substantially as described.

2. The combination with a lifting-magnet, of a curved yoke and a tipping or rolling shackle therefor for facilitating the operation of lifting and stacking up metal plates vertically in a rack, or removing them from the rack and laying them down in a horizontal position, substantially as described.

3. The combination with a lifting-magnet, of a curved yoke secured to the opposite sides thereof, and having lateral loops adjacent to the magnet, and a roller held in a connecting-link, applied to said yoke to form a tipping or rolling shackle, whereby plates may be conveniently lifted from a horizontal position and set up on edge in an approximately vertical position, substantially as described.

710,042. SEWING-MACHINE TABLE OR CABINET HEAD. JOHN OSBER and ANTON HAGENBUCH, Chicago, Ill., assignors to F. Patzack Manufacturing Company, a Corporation of Illinois. Filed Oct. 19, 1901. Serial No. 79,199. (No model.)

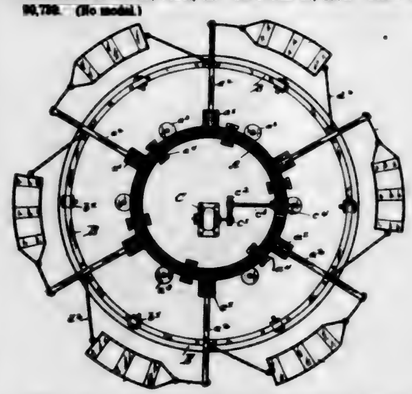


Claim.—1. In a sewing-machine table, the combination of a top-leaf and a board thereunder, each board provided with an aperture therein, hinges connecting the top-leaf and the board thereunder, a sewing-machine base-board pivotally attached adjacent to one of the edges thereof to the first-named board, a bracket on the under side of the machine base-board adjacent to the edge of each base-board which is opposite the pivotal hinges thereof, depending brackets attached to the first-named board, levers pivotally attached at one of the ends thereof, respectively, to the hinged top-leaf, each levers resting on the depending brackets, a rod connecting the levers at the ends of each levers opposite the pivoted ends respectively on which connecting-rod the bracket on the machine base-board rests and by which rod the position of the bracket and of the base-board is determined; substantially as described.

2. In a sewing-machine table, the combination of a top-leaf, a board thereunder, each board provided with an aperture therethrough, hinges connecting the top-leaf and the board thereunder, a sewing-machine base-board pivotally attached adjacent to one of the edges thereof to the first-named board so as to be brought into the aperture in each board when in a horizontal plane, a leaf, pivotal hinges connecting each leaf and the machine base-board, a bracket on the under side of the machine base-board adjacent to the edge of the base-board opposite to the pivotal hinges thereof, depending brackets attached to the first-named board, levers pivotally attached at one of the ends thereof, respectively, to the hinged top-leaf, each levers resting on the depending brackets, a rod connecting the levers, on which connecting-rod the bracket on the machine base-board rests and by which rod the position of the bracket and of the base-board is determined and on which rod, also, the leaf pivotally attached to the machine base-board rests when each machine base-board is suspended on its pivots; substantially as described.

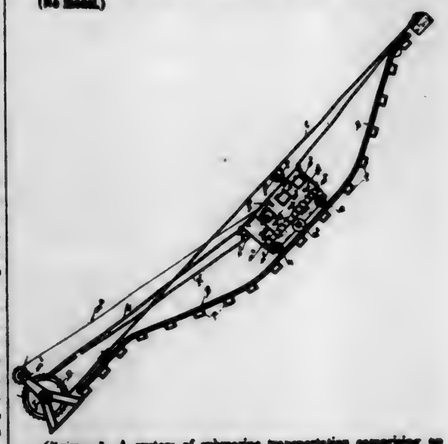
3. In a sewing-machine table, the combination of a top-leaf, a board thereunder, each board provided with an aperture therethrough, hinges connecting the top-leaf and the board thereunder, a sewing-machine base-board pivotally attached adjacent to one of the edges thereof to the first-named board so as to be brought into the aperture in each board when in a horizontal plane, a leaf, pivotal hinges connecting each leaf and the machine base-board, each leaf forming an extension of the machine base-board when each base-board is in a horizontal plane and forming a part of the dust-proof casing of the sewing-machine on the base-board, when each base-board is lowered, and a bottom board extending substantially in a horizontal plane from the ends of the table and from the back side of the table to contact with each leaf when the machine base-board is down, a bracket on the under side of the machine base-board and a connection between the top hinged leaf and each bracket whereby the raising and lowering of the machine base-board is effected by the opening and closing of the hinged top-leaf; substantially as described.

710,043. LAND, MARINE, OR SUBMARINE MERRY-GO-ROUND. ALEXANDER DAVIDSON, Joliet, Ill. Filed Jan. 23, 1902. Serial No. 90,792. (No model.)



Claim.—In an apparatus of the character described, a passenger-holding device consisting of a closed cylindrically-shaped chamber having water-tight windows and doors therein, and provided with an air-shaft communicating with the interior of the chamber and adapted to project above the surface of the water, in combination with an inclined platform, a carrier rotatably mounted on said platform and adapted to support and propel said passenger-holding device, substantially in the manner and for the purpose set forth.

710,044. SYSTEM OF SUBMARINE TRANSPORTATION. ALEXANDER DAVIDSON, Joliet, Ill. Filed Mar. 3, 1902. Serial No. 96,592. (No model.)



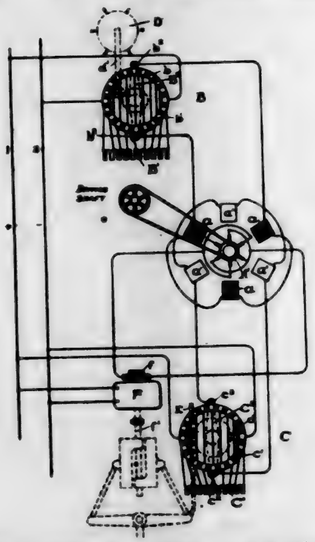
Claim.—1. A system of submarine transportation comprising an observation-car, a trunk over which said car is adapted to travel, means

for propelling or hauling said car, means for supplying the car with air while submerged, and means for transmitting signals between the occupants of the car and persons on land, all substantially in the manner and for the purpose set forth.

2. A system of submarine transportation comprising an observation-car, a track over which said car is adapted to travel, means for hauling said car, means for supplying the car while submerged, with air, and for renewing said supply of air while submerged, and means for transmitting signals between the occupants of the car and persons on land, substantially as set forth.

3. A system of submarine transportation, comprising an observation-car, a track over which said car is adapted to travel, means located on shore for hauling said car, an air-compressor located on shore and connected with the car by a flexible pipe, and means for exhausting the foul air within the car, and for admitting fresh air as needed, substantially as set forth.

710,045. ELECTRICAL STEERING-GEAR. MAXWELL W. DAY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 23, 1901. Serial No. 73,073. (No model.)



Claim.—1. In a system for controlling movement at a distance, the combination with a generator, of a motor in circuit with the armature of said generator, manually-controlled means for inducing a field of force in said generator, and means controlled by the motor for inducing an opposing field of force in said generator.

2. In a system for controlling movement at a distance, the combination with a generator, of a motor in circuit with the armature thereof, manually-controlled means for inducing a variable field of force in said generator, and means controlled by the motor for inducing an equally-variable opposing field of force in said generator.

3. In a system for controlling movement at a distance, the combination with a generator having a differential field-winding, comprising two independent windings arranged to be supplied with current from a suitable source, of means for causing unequal currents to flow in the two windings, a motor in circuit with said generator, and means controlled by the motor for equalizing the currents in the two windings.

4. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of means for sending balanced currents through said windings, means for unbalancing said currents, a motor in circuit with said generator, and means controlled by the motor for restoring the balance between said currents.

5. In a system for controlling movement at a distance, the combination with a generator having a differential field-winding, of a motor, means for manually controlling one part of the field-winding, and means whereby the motor controls the other part.

6. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of a motor in circuit with the armature of said generator, means for sending a current of varying volume through one of said field-windings, and means controlled by the motor for sending a similar current in the opposite direction through the other winding.

7. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of a motor in circuit with the armatures of said generator, means for sending a current of varying volume in either direction through one of said field-windings, and means controlled by the motor for sending a similar current in the opposite direction through the other winding.

8. In a system for controlling movement at a distance, the combination with a generator having two opposing field-windings, of two rheostats respectively connected with said windings, means for controlling one of said rheostats manually, and an electrodynamic device actuated by current from said generator, and controlling the other rheostat.

9. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of a movable contact connected with each terminal of said windings, a source of current-supply, two resistances connected therewith, means for manually shifting two of the contacts along one of said resistances, a motor actuated by the generator-current, and means whereby said motor can shift the other contacts along the other resistance.

10. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of a movable contact connected with each terminal of said windings, a source of current-supply, two resistances connected therewith, means for manually shifting the contacts connected with one of said windings to cut out more or less of one resistance, and means actuated by the generator-current for shifting the contacts of the other winding to cut out more or less of the other resistance.

11. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of means for supplying current to said windings and producing therein opposing and equal magnetizing effects, means for manually varying the current in one winding, a motor in circuit with said generator, and means controlled by the motor for varying the current in the second winding to a degree corresponding with the variation of that in the first winding.

12. In a system for controlling movement at a distance, the combination with a generator having two independent field-windings, of means for supplying current to both windings, a resistance in circuit with each winding, means for manually varying one resistance, a motor in circuit with the generator, and means controlled by the motor for similarly varying the other resistance.

13. In a steering apparatus, the combination with a rudder-actuating motor, of a generator for supplying energy thereto, having a differential field-winding, means connected with the steering-wheel for controlling one part of the field, and means connected with the rudder-actuating motor for controlling the other part of the field.

14. In a steering apparatus, the combination with a rudder-actuating motor, of a generator for supplying energy thereto having a differential field-winding, a rheostat geared to the steering-wheel for controlling one part of said field, and a rheostat geared to the motor for controlling the other part of the field.

710,046. TUBE-MACHINE. FERDINAND DEKING, Waterbury, Conn. Filed May 31, 1901. Serial No. 62,490. (No model.)

Claim.—1. In a tube-forming machine, the combination with the drawing-die; of a drawing-punch; means for imparting a reciprocating movement thereto toward and away from the drawing-die; and automatic means for moving the same into and out of alinement therewith.

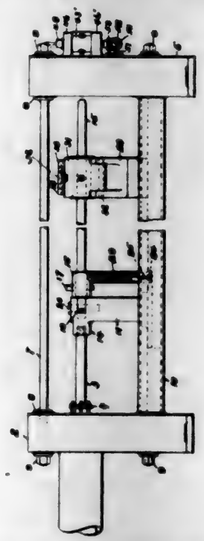
2. In a tube-forming machine, the combination with the drawing-die; of a drawing-punch; means for imparting a reciprocating movement thereto toward and away from the drawing-die; and automatic means for moving the same into and out of alinement therewith during the reciprocation of said drawing-punch.

3. In a tube-forming machine, the combination with the drawing-die; of a hydraulically-actuated piston; a drawing-punch pivotally connected therewith; means for moving said drawing-punch toward and away from the said drawing-die; and automatic means for swinging the same upon its pivot-mountings into and out of alinement with said drawing-die.

4. In a tube-forming machine, the combination with the drawing-die; of a hydraulically-actuated piston; a drawing-punch pivotally connected therewith and movable toward and away from the said drawing-die; and cam mechanism for moving the said drawing-punch into and out of alinement with the said drawing-die.

5. In a tube-forming machine, the combination with a drawing-die; of a hydraulically-actuated piston; a drawing-punch pivotally connected with said piston at one end; and a member, through which the said punch slides during its reciprocation, for sustaining the other end of said punch.

6. In a tube-forming machine, the combination with the drawing-die 27; of the piston 3 having the cross-head 11 connected therewith, the drawing-punch 15 pivotally secured to the said cross-head by the swivel-pin 20; cam 21; and roll 24 connected with said drawing-punch, all constructed and operating substantially as described.



7. In a tube-machine; a punch-support comprising a rigid standard; a movable member connected therewith; and means for adapting said support to punches of varying sizes, said means comprising halved boxes, the bores of which correspond in size with that of the punch; and threaded means for separably securing said halved boxes to said standard and a movable member, substantially as shown and described.

8. In a tube-forming machine, the combination with the bulkhead having an aperture therethrough for the passage of a drawing-punch; of projecting parts upon said bulkhead; stripper mechanism comprising stripper-carriers having stripper-blocks connected therewith and movably mounted between said projecting parts; and means rotatably mounted within said projecting parts and said stripper-carrier for moving said stripper-carriers toward and away from the center of said aperture, substantially as described.

9. In a tube-forming machine, the combination with the drawing-die and bulkhead; of stripper-blocks mounted within stripper-carriers; means for moving said strippers and stripper-carriers toward and away from each other and means for actuating the said stripper-blocks synchronously, the said means comprising an idler-shaft having gears thereon which mesh into gears upon the said crank-shafts.

10. In a tube-forming machine, the combination with the drawing-die and bulkhead; of the strippers 41 removably secured within the stripper-carriers 43; crank-shafts 45, having cranks 44 thereon; idler-shaft 50 having the gears 52 52 thereon; and gears 53 53 fixed to the crank-shafts 45 and meshing into the said gears 52 52, all constructed and operating substantially as described.

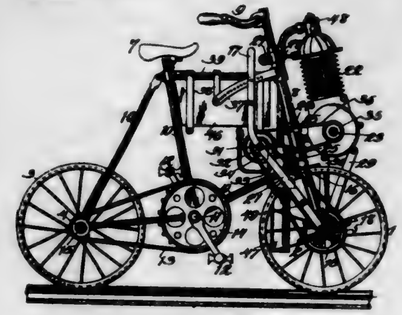
11. In a tube-forming machine, the combination with a punch; of a support, through which the said punch slides during its movement, said support having a movable member which, when open, permits the said punch to be moved out of said support, substantially as shown and described.

12. In a tube-forming machine, the combination with a swinging punch; of a support, through which the said punch slides during its movement, said support having a hinged member connected therewith, so arranged that when in its open position, the said punch can be moved laterally out of said support, substantially as shown and described.

710,047. PYROTECHNIC COMPOUND. ARTHUR RHEINHARDT, Eberfeld, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed Feb. 3, 1902. Serial No. 92,468. (No specimens.)

Claim.—The herein-described new pyrotechnic compound being a mixture of magnesium with manganese peroxid, substantially as described.

710,048. RAILWAY-CAR. SIMEON H. ELLIS, Brooklyn, N. Y., assignor to Hugh L. Fox, New York, N. Y. Filed Jan. 27, 1902. Serial No. 91,363. (No model.)



Claim.—1. The combination with the framework and running-gear of a car, of a motor supported upon said framework, a rotating part to which such motor imparts rotary motion, a pivoted lever controllable by the operator to be thrown into or out of operative position, and power receiving and transmitting means carried by the pivoted lever for transmitting motion from such rotating part to the running-gear of the car and connected with such rotating part and the running-gear, such connection including a friction belt connection controlled by the movement of the lever and another connection maintained independently of the movement of the lever.

2. The combination with the framework and running-gear of a car, of a motor supported upon said framework, a rotating part to which such motor imparts rotary movement, a pivoted lever controllable by the operator to be thrown into or out of operative position, and power receiving and transmitting means carried by the pivoted lever and connected to the running-gear of the car so as to rotate at all times with the running-gear and movable relatively to and having a friction belt connection with the rotary part actuated by the motor, such friction belt connection being controllable by the movement of such lever.

3. The combination with the framework and wheels and axles of a railway-car, of a motor supported upon said framework, a rotating part to which such motor imparts rotary motion, a lever pivoted concentrically with an axle of the car and carrying a rotating part connected to such axle so as to rotate at all times therewith, and a frictional rotative connection between the rotating part actuated by the motor and the rotating part carried by the lever, whereby the transmission of motion between the motor and the rotating part carried by the lever may be varied by the actuation of the lever.

4. The combination with a framework and running-gear of a car, of a motor supported upon said framework, a pivoted lever provided with power receiving and transmitting means controllable by the position of such lever for variably transmitting motion between the motor and running-gear, and a clamping-arm carried by the framework, the controlling-lever and clamping-arm being provided with projected and depressed engaging parts whereby the controlling-lever may be held in any one of a number of positions.

5. The combination with the framework and wheels and axles of a car, of a motor supported upon said framework, a rotating part to which such motor imparts rotary motion, a lever pivoted concentrically with an axle of the car and carrying a rotating part connected to such axle so as to rotate at all times therewith, a frictional rotative connection between the rotating part actuated by the motor and the rotating part carried by the lever, such frictional rotative connection being controllable by the position of such lever, and clamping means whereby such lever is held in desired position.

6. The combination with the framework and wheels and axles of a car, of a motor supported upon said framework, a rotating part to which such motor imparts rotary motion, a lever pivoted concentrically with an axle of the car and carrying a rotating part connected to such axle so as to rotate at all times therewith, a frictional rotative connection between the rotating part actuated by the motor and the rotating part carried by the lever, such frictional rotative connection being controllable by the position of such lever, and a clamping-arm carried by the framework, the controlling-lever and clamping-arm being provided with projected and depressed engaging parts whereby the controlling-lever may be held in any one of a number of positions.

7. The combination with the framework and running-gear of a car, of a motor supported upon said framework, a pivoted lever provided with means controllable by the position of such lever for variably transmitting

motion between the motor and running-gear, a clamping-arm carried by the framework and having a series of depressions therein, the controlling-lever being provided with a projection adapted to enter and engage any one of such depressions controlling lever relatively to the clamping-arm, and a spring working between the clamping-arm and controlling-lever and constructed to normally press the projection into the depression with which it is engaged.

8. The combination with the framework and wheels and axles of a car, of a motor adapted to be driven by explosive force and supported upon said framework, a pivoted lever carrying a rotating part connected to an axle of the car so as to rotate at all times therewith, a frictional connection between the motor and the rotating part carried by the controlling-lever, and clamping means constructed to hold the controlling-lever in desired position.

710,049. CLAMP. SEELE H. ELLIS, Brooklyn, N. Y., assignor to Hugh L. Fox, New York, N. Y. Filed Jan. 27, 1902. Serial No. 91,369. (No model.)

Claim.—1. A clamp comprising an elongated sleeve divided longitudinally into parts, a plurality of clamping-yokes at different points along the length of such sleeve and bearing upon such sleeve to clamp the parts thereof upon a support, and attaching means for engagement with the device to be supported, such attaching means being carried by one of the parts of the sleeve.

2. A clamp comprising an elongated sleeve divided longitudinally into two parts, a plurality of clamping-yokes each having a band bearing upon one of such parts and a cap engaging with such band and bearing upon the other of such parts, and lugs for attachment to the device to be supported or carried by one of the parts of the sleeve.

3. A clamp comprising an elongated sleeve divided longitudinally into two parts, a cross-bar and lugs for attachment to the part to be supported medially carried by one of the parts of the sleeve, two clamping-yokes, one at each side of the attaching-lugs and between the attaching-lugs and the end of the sleeve, each clamping-yoke having a band bearing upon one of the parts of the sleeve and a cap engaging with the band and bearing upon the other part of the sleeve.

4. A clamp comprising an elongated sleeve divided longitudinally into parts, a plurality of clamping-yokes each comprising a U-shaped band having a bearing-surface upon such sleeve conforming thereto and also comprising a cap engaging with such band and bearing upon the sleeve oppositely to the band, and attaching means for engagement with the device to be supported, such attaching means being carried by one of the parts of the sleeve.

5. In a clamp, the combination of the part sleeves 2 and 3, the cross-bar 4 and lugs 5 secured to the part sleeve 2, the braces 6 between the cross-bar and part sleeve, and the clamping-yokes each comprising the U-shaped band 7 having a bearing-surface upon the sleeve conforming thereto and also comprising a cap 9 bearing upon the sleeve oppositely to the band, each U-shaped band 7 having ends engaged by clamping means with the cap of the corresponding yoke, substantially as set forth.

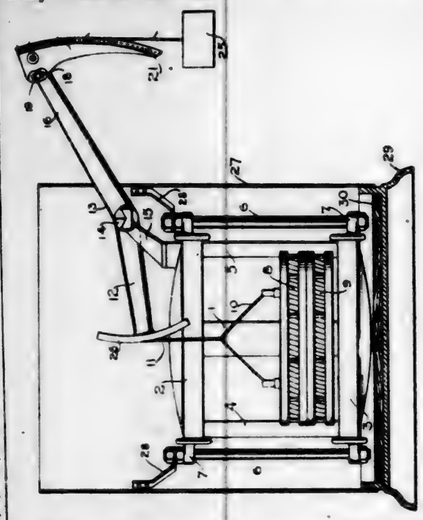
710,050. CONSTANT-CURRENT TRANSFORMER. AUGUSTUS R. EVERETT, Lynn, Mass., assignor to the General Electric Company, a Corporation of New York. Filed Mar. 4, 1899. Serial No. 707,721. (No model.)

Claim.—1. The combination of relatively fixed and movable coils, one of which is attached by suitable means to one end of an oscillating lever, a device adjustably secured to the opposite end of the lever, and having a curved winding-surface, the centers of curvature of parts of which are non-coincident with the axis of oscillation of the lever.

2. In an alternating-current transformer the combination of primary and secondary coils, means for allowing the force of repulsion between the currents in the coils to cause a relative motion in a straight line between the coils, and means for opposing the force of repulsion by a force which decreases as the load decreases.

3. In an alternating-current transformer the combination of primary and secondary coils, means for allowing the force of repulsion between the current in the coils to cause a relative motion in a straight line between the coils, and means for opposing the force of repulsion by a force which is less at some given load than at a higher load.

4. In an alternating-current transformer the combination of primary and secondary coils movable in a straight line relatively to each other, and means for opposing to the force of repulsion between the currents in the coils, a force which varies in such a manner as to make the current in the secondary coil at full load equal in value to the current in the secondary coil when the load is small.



5. The combination of relatively fixed and movable coils, in mutual inductive relation to each other, an oscillating lever to one end of which one of the coils is suitably attached, and a device with a curved winding-surface pivoted to the other end of the lever.

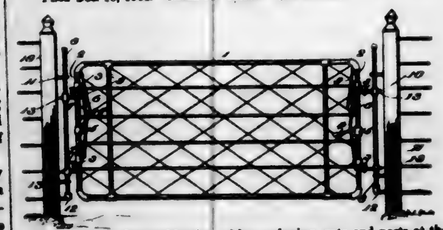
6. The combination of a core, a relatively movable coil cooperatively related thereto, a pivoted member, means for supporting said coil from said member, a device having an eccentric winding-surface carried by said member, a weight, and a flexible connection attached to said weight and passing over said winding-surface.

7. The combination of a core, a relatively movable coil cooperatively related thereto, a pivoted member, means for supporting said coil from said member, an adjustable winding-surface carried by said member, and a counterbalancing-weight suspended by a flexible connection passing over said surface.

8. The combination of a lever, a coil suspended from one end of the lever, an eccentric winding-surface carried by the other end of the lever, and a counterbalancing-weight having a flexible connection passing over said winding-surface.

9. The combination of a lever, a coil suspended from one end of the lever, means for applying a force of constant value to the other end of the lever, and means for automatically varying the point of application of said force to said lever.

710,051. GATE-HINGE. PATRICK PULLAR, Churubusco, Ind. Filed Dec. 16, 1901. Serial No. 86,153. (No model.)



Claim.—1. In combination with a swinging gate and posts at the ends of the gate-opening, hinge-rods connected to the said posts, hinge members applied to the hinge-rods, coöperating hinge members applied to the ends of the gate, and means for simultaneously moving the hinge members at either end of the gate to admit of their separation from or connection with the hinge members applied to the hinge-rods, substantially as specified.

2. In combination, posts, a gate, hinge members applied to the said posts and having their outer ends enlarged, hinge members applied to the ends of the gate and approximately of the form of a grab-hook, and means for disconnecting the hinge members at either end of the gate from the post members to admit of opening the gate from either side or at opposite ends, substantially as described.

3. In combination, posts, a gate, hinge members applied to the said posts and having their outer ends forked and the fork members oppositely deflected, hinge members applied to the ends of the gate and approximately of the form of a grab-hook, and means for disconnecting the hinge members at either end of the gate from the post members to admit of opening the gate from either side or at opposite ends, substantially as described.

4. In combination, a post, a rod connected with the post so as to turn about a vertical axis, hinge members adjustably connected with the said rod and having their outer ends forked, a gate, grab-hooks loosely mounted upon the gate, a connection between the grab-hooks, and a lever for operating said connection to simultaneously move the grab-hooks, substantially as set forth.

710,052. APPARATUS FOR MAINTAINING UNIFORM RESISTANCE IN ELECTRIC CIRCUITS. FREDERICK A. GILBERT, Brookline, and ELIHU O. LOMBER, Beechmont, Mass., assignors to the General Electric Company, a Corporation of New York. Filed Dec. 17, 1897. Renewed Feb. 3, 1899. Serial No. 704,434. (No model.)

Claim.—1. An electric-arc lamp provided with series and shunt regulating coils, and a controlling-magnet in shunt to the arc for cutting out part of one of said coils after a determinate rise of temperature due to starting the lamp, to compensate for change of arc length due to such rise of temperature.

2. In an electric-arc lamp, series and shunt wound carbon-feed-controlling coils, and means, including an electromagnet in circuit with the shunt-winding and responsive to increase of voltage at the arc, to increase the effectiveness of the shunt-winding.

3. In an electric-arc lamp, series and shunt wound carbon-feed-controlling coils, means, including an electromagnet in circuit with the shunt-winding and responsive to increase of voltage at the arc, to increase the effectiveness of the shunt-winding, and a manually-operated regulating device to determine the time of operation of the electromagnet.

4. In an electric-arc lamp, series and shunt wound carbon-feed-controlling coils, a shunt-circuit, including a portion of one of said coils, and a controlling-magnet for said circuit, in circuit with the shunt-winding, to operate the shunt-circuit and cut out the portion of the coil included therein upon increase of voltage at the arc.

5. In an electric-arc lamp, series and shunt wound coils to control the carbon, a controlling-magnet in circuit with the shunt-winding, its armature, means to control its time of operation, said armature forming one terminal of a shunt-circuit including a portion of one of said coils, and a fixed contact forming the other terminal, whereby increase of current in the shunt-winding will energize the controlling-magnet to close the shunt-circuit, and thereby cut out the included coil portion.

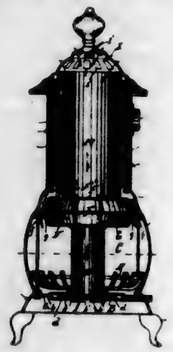
6. In an electric-arc lamp, the combination of two magnets operating on a common feed-controlling mechanism, and means controlled by rise of temperature of the magnet-coils after starting the lamp to compensate for change of arc length due to such rise of temperature.

7. In an electric-arc lamp, the combination of two magnets differentially mounted in relation to a common feed-controlling mechanism, and an electromagnet controlled by change of voltage in the arc to vary the strength of one magnet after starting the lamp to compensate for change of arc length due to rise of temperature.

8. An electric-arc lamp provided with regulating devices for the arc traversed by the current, and means for increasing the effectiveness of said devices after heating under the transit of current, to maintain uniform the arc length.

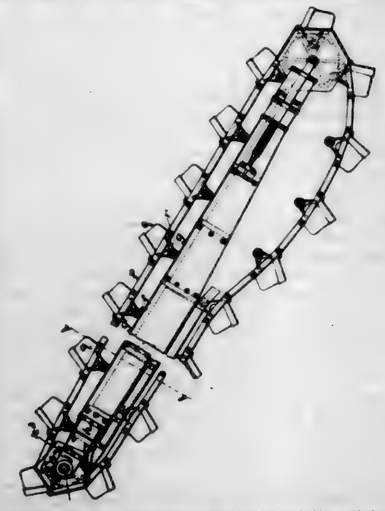
9. An arc-lamp provided with a regulating-coil and a cut-out controlled by increase of temperature after starting of the lamp, to compensate for change of resistance of the regulating-coil due to heating.

710,053. GAS-STOVE. MATTHEW GERWOLD, Jr., Erie, Pa. Filed July 23, 1901. Serial No. 69,345. (No model.)



Claim.—In a gas-stove, the combination of a base, a gas-burner secured to lugs thereon, inwardly-extending arms on said gas-burner, a fire-box resting upon said base, a central air-flue secured at its lower end to the inwardly-projecting arms of the gas-burner, a heating-chamber resting upon and supported by said flue so as to leave an annular space between it and the shell of the fire-box, a baffle-plate in said heating-chamber having an annular opening around its periphery, an air-flue on the top of said heating-chamber discharging through openings in the stove-top, and a smoke-flue resting upon the top of the shell of the fire-box and surrounding the air-flue above the heating-chamber, substantially as set forth.

710,054. DREDGER AND EXCAVATOR. ISAAC B. HAMMOND, Portland, Oreg. Filed Feb. 9, 1900. Serial No. 4,690. (No model.)



Claim.—1. The combination with the dredge-ladder and the tumbler for the dredge-chain, of an endless dredge-chain and buckets; traveling carriers therefor, attached below the chain and narrowed toward the bow, so that such carriers in width occupy only a portion of the space within the span of the buckets; a railed way extending the length of the

upper surface of the ladder leading from and to the tumblers; a railed way extending from the upper tumbler along the under surface of the ladder for a part of its length, being disconnected at a convenient point, allowing enough of the dredge-chain and buckets at the lower end of the ladder to hang free, to provide sufficient drag; and a guard for holding the chain-carriers traveling along the railed way on the under side of the ladder against a lateral thrust or strain, the tumblers being adapted to allow the traveling carriers to pass between their sides while the chain passes over their rims, substantially as described.

2. The combination with the dredge-ladder of the tumblers for the dredge chain, consisting of two side plates having projecting ledges on their inner faces, providing interrupted, narrow rims on which to receive the dredge-chain, and leaving ample space between such rims for the carriers to pass through; an endless dredge-chain and buckets; traveling carriers therefor attached below the chain and narrowed toward the base, so that such carriers in width occupy only a portion of the space within the span of the buckets; a railed way extending the length of the upper surface of the ladder and leading from and to the tumblers; a railed way extending from the upper tumbler along the under surface of the ladder for a part of its length, being disconnected at a convenient point allowing enough of the dredge-chain and buckets at the lower end of the ladder to hang free, to provide sufficient drag; and a guard for holding the chain-carriers traveling along the railed way on the under side of the ladder against a lateral thrust or strain, substantially as described.

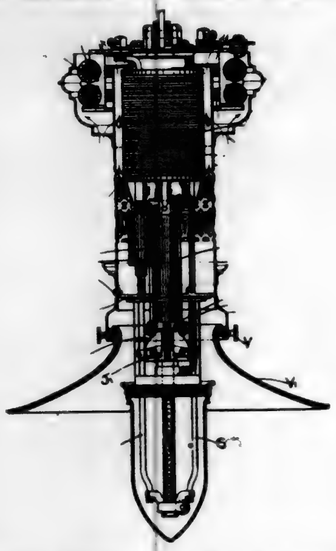
3. The combination in a dredging or excavating machine of a tower; bearings thereby supported; a dredge-ladder provided at its upper end with hollow trunnions, supported in said bearings; a shaft journaled in the trunnions; tumblers for the dredge-chain, the upper of which is mounted on said shaft; a railed way extending the length of the upper surface of the ladder and leading from and to the tumblers; a railed way extending from the upper tumbler along the under surface of the ladder for part of its length, being disconnected at a convenient point, allowing enough of the dredge-chain and buckets at the lower end of the ladder to hang free, to provide sufficient drag; and a guard for holding the chain-carriers traveling along the railed way on the under side of the ladder against a lateral thrust or strain, the tumblers being adapted to allow the traveling carriers to pass between their sides, while the chain passes over their rims, substantially as described.

4. The combination in a dredger or excavating-machine of a tower; bearings thereby supported, comprising the plates *m* and caps therefor; the trunnions having flanges i^3; a dredge-ladder provided at its upper end with perforated plates *h h'*, inserted on the trunnions, and the latter being supported in the tower-bearings; a shaft journaled in the trunnions; tumblers for the dredge-chain, the upper of which is mounted on such shaft; an endless dredge-chain and buckets; traveling carriers therefor, attached below the chain and narrowed toward the base, so that such carriers in width occupy only a portion of the space within the span of the buckets; a railed way extending the length of the upper surface of the ladder and leading from and to the tumblers; a railed way extending from the upper tumbler along the under surface of the ladder for part of its length, being disconnected at a convenient point, allowing enough of the dredge-chain and buckets at the lower end of the ladder to hang free, to provide sufficient drag; and a guard for holding the chain-carriers traveling along the railed way on the under side of the ladder against a lateral thrust or strain, the tumblers being adapted to allow the traveling carriers to pass between their sides while the chain passes over their rims, substantially as described.

5. The combination with the dredge-ladder and the tumblers for the dredge-chain, of an endless dredge-chain and buckets; traveling carriers therefor attached below the chain and narrowed toward the base, so that such carriers in width occupy only a portion of the space within the span of the buckets; a railed way extending the length of the upper surface of the ladder, leading from and to the tumblers, a railed way extending from the upper tumbler along the under surface of the ladder for a part of its length, being disconnected at a convenient point, allowing enough of the dredge-chain and buckets at the lower end of the ladder to hang free, to provide sufficient drag, such railed way consisting of the channel-irons suspended from the ladder and provided with rails on the interior of their upper and lower flanges; and a guard for holding the chain-carriers traveling along the railed way on the under side of the ladder against a lateral thrust or strain; the tumblers being adapted to allow the traveling carriers to pass between their sides while the chain passes over their rims, substantially as described.

6. The combination with the dredge-ladder and the tumblers consisting of two side plates having ledges on their inner faces, providing interrupted, narrow rims on which to receive the dredge-chain, and leaving ample space between such rims for the carriers to pass through; a railed way extending the length of the upper surface of the ladder and leading from and to the tumblers; a railed way extending from the upper tumbler along the under surface of the ladder for part of its length; the dredge-chain and buckets; and the carriers therefor attached below such buckets, the carriers comprising a body having a journal-box at its base and axle, the flanged wheels adapted to revolve independently of each other, and the beveled glands *l* and packing therein, projecting the abutting faces of the hubs of said wheels, and the ends of the journal-boxes, substantially as described.

710,055. ELECTRIC-ARC LAMP. CHARLES E. HARTMAN, Lynn, Mass., assignor to the General Electric Company, a Corporation of New York. Filed July 24, 1900. Serial No. 24,671. (No model.)



Claim.—1. In an electric-arc lamp, the combination of a tube, a coil and a spool both of which surround the tube, and adjusting devices mounted on the spool for centering or adjusting the relation of the tube and the spool.

2. In an electric-arc lamp, the combination of a vertically-extending tube forming the central portion of the lamp, a coil and a spool surrounding the tube, lugs formed on the spool, and adjusting-screws mounted in the lugs for centering the tube.

3. In an electric-arc lamp, the combination of a coil, a spool therefor, a tube which is screw-threaded to one head of the spool, lugs extending downwardly from the other head of the spool, and adjusting-screws mounted in the lugs for centering the tube and spool with respect to each other.

4. In an electric-arc lamp, the combination of a central tube which forms the lamp-frame, a spool separated from the tube and having a winding thereon, a tubular armature mounted for movement between the tube and the spool and independent of both, a clutch suspended by the armature, and a dash-pot for checking violent movements.

5. In an electric-arc lamp, the combination of a central tube which forms the lamp-frame, a cylindrical armature surrounding the tube and arranged to move independent thereof, a plate carried by the armature, and having a projection to which an element of a dash-pot is secured, a clutch, rods which connect the plate with the clutch, and a tripping-platform for the clutch which is rigidly secured to the tube.

6. In a resistance-supporting device, the combination of a plate, a ring, metal pieces which are riveted to the plate and to the ring, and are provided with projections, and insulators mounted between the projections for supporting the resistance.

7. In a carbon-holder, for an arc-lamp, the combination of a pair of side rods, a yoke having a U-shaped opening which yoke holds the lower ends of the rods in place, a pin or projection on said yoke, a clamp having an opening into which the pin projects, and a screw which acts to hold the carbon and clamp in place.

8. In an electric-arc lamp, the combination of a central tube, a detachable contact-cap having a spring-pressed finger, which cap is capable of sliding through the tube and is arranged to be mounted therein, a holder for the carbon rod, and a flexible cable which connects the cap and the holder.

9. In an electric-arc lamp, the combination of a slotted central tube, a detachable cap capable of sliding through the tube and arranged to be seated therein, a holder for the carbon which is provided with a projection that works in the slot in the tube to prevent the holder from turning, and a coiled cable which connects the cap and the holder.

10. As an article of manufacture, a holder for carbons, comprising a cap having a spring-pressed portion adapted to engage with a conducting-tube in the lamp, which cap is capable of being inserted or withdrawn from the tube, a holder containing a weight, and a flexible cable which connects the cap and holder.

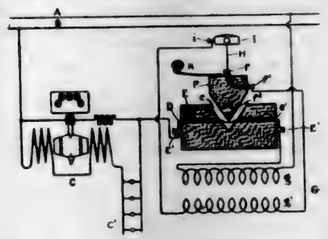
11. In an electric lamp, the combination of an actuating-magnet, a resistance which is separated therefrom by an air-space, and a detachable cylindrical inclosing casing which extends between the coil and resistance-wire and prevents the heated air from directly striking the magnet.

12. In an electric-arc lamp, the combination of an actuating-magnet, a resistance which is separated therefrom by an air-space, a detachable cylindrical inclosing casing which extends between the coil and resistance-wire and prevents the heated air from striking the magnet, and a ventilated cornice which incloses the resistance-wire and is secured to the detachable casing.

13. In an arc-lamp, the combination of a magnet, a resistance which is separated therefrom by an air-space, a detachable ventilated cylindrical casing which surrounds the coil and prevents the hot air from striking the magnet, and a ventilated cornice which surrounds the resistance and is secured to the casing below the resistance, the openings in the cornice and the casing being so arranged that the same air will freely circulate in both.

14. In an electric-arc lamp, the combination of a tubular conductor, a cap arranged to make frictional engagement with the interior of the tubular conductor and so constructed that it can be forced into the end of the conductor, a carbon-holder, and a flexible conductor connecting the cap with the carbon-holder.

710,056. AUTOMATIC CIRCUIT-BREAKER. CARYL D. HASKINS, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Dec. 14, 1900. Serial No. 39,535. (No model.)



Claim.—1. The combination of an electric circuit, automatic means for mechanically cutting a conductive part thereof upon determinate circuit conditions, and means for expulsively extinguishing the arc formed at the cut part.

2. The combination with direct-current electrical apparatus, of a circuit-breaker therefor, and a separate controlling-circuit for said circuit-breaker supplied with energy through said apparatus and energized by a high-potential alternating current in the circuit of the apparatus.

3. The combination with direct-current electrical apparatus, of a circuit-breaker therefor, and a transformer in series with the apparatus and energized by a high-potential alternating current in the circuit of said apparatus and controlling the circuit-breaker.

4. An automatic circuit-breaker for electrical apparatus, comprising a transformer having its primary coil in circuit with the apparatus, a fragile conductor in said circuit, and means responsive to a current in the secondary coil for rupturing said fragile conductor.

5. An automatic circuit-breaker for electrical apparatus, comprising a transformer having its primary coil in circuit with the apparatus, a fragile conductor in said circuit, a device for mechanically severing said conductor, and means responsive to a current in the secondary coil for causing said device to operate.

6. An automatic circuit-breaker for electrical apparatus, comprising a transformer having its primary coil in circuit with the apparatus, a fragile conductor in said circuit, a block suspended above said conductor and adapted when released to sever said conductor, and means responsive to a current in the secondary coil for releasing said block.

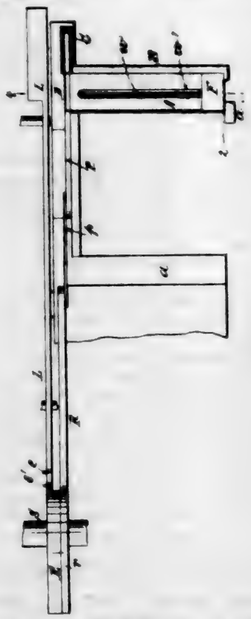
7. An automatic circuit-breaker for electrical apparatus, comprising a transformer having its primary coil in circuit with the apparatus, a block having a notch, a fragile wire forming part of the circuit and spanning said notch, a wedge block to fit the notch, means for suspending the wedge block above the notch, and means responsive to a current in the secondary coil for releasing the wedge block.

8. The combination with a block of insulating material having a small passage intersected by a deep notch, of a fragile wire led through said passage and spanning said notch, and a wedge block adapted to fit said notch.

9. The combination with a block of insulating material having a deep notch and an intersecting small passage, of binding-posts near the ends of said passage, a fragile wire led through said passage across the notch and held in the binding-posts, and a block of insulating material adapted to fit the notch, and containing passages near its lower end.

10. The combination with direct-current electrical apparatus, of a transformer having its primary coil in the circuit thereof, a fragile conductor forming part of said circuit, a block adapted, when dropped, to sever said conductor, and a fusible wire suspending said block, and in circuit with the secondary coil of said transformer.

710,057. TYPE-LINE-DETACHING MECHANISM. LOUIS E. JOHNSON and ABBOT A. LOW, Brooklyn, N. Y., assignor to Alden Type Machine Company, New York, N. Y. Filed Apr. 6, 1901. Serial No. 54,578. (No model.)



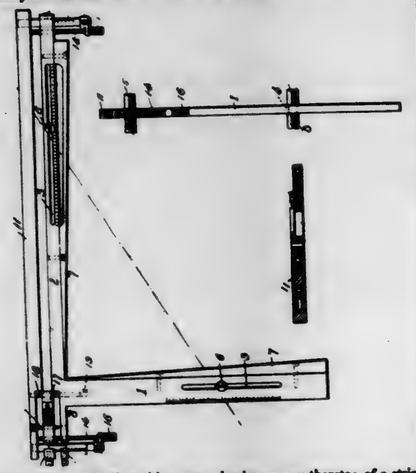
Claim.—The combination of the pivotally-supported type-galley A, adapted to assume both a horizontal and a vertical position, a stationary front plate B, for supporting the types in the galley when in a vertical position, a follower F, for advancing the types in said galley, an abutment D, for supporting the types against the action of such type-forwarding mechanism, type-channel C, arranged to receive a line of type from the galley, a pusher-blade P, for forwarding lines of types consecutively in said type-containing channel C, and mechanism for reciprocating said line-forwarder P, substantially in the manner and for the purpose set forth.

710,058. ADJUSTABLE PITCH-BOARD. ALBERT JOHN, Red Wing, Minn. Filed Mar. 13, 1902. Serial No. 98,132. (No model.)

Claim.—1. The combination with a square; of a strip parallel to one member thereof, means for adjusting the strip from or toward said member, an arm to the square parallel to the strip, a strip between said arm and parallel strip, and means for adjusting the intermediate strip laterally.

2. The combination with a square having a slot in each member thereof and graduations adjacent to each slot; of a pin adjustably secured in each slot and movable longitudinally therein, and a detachable wedge-strip secured to each member of the square.

3. The combination with a square; of a strip parallel to one member thereof, means for adjusting the strip from or toward said member, an arm to the square parallel to the strip, a strip between said arm and parallel strip, means for adjusting the intermediate strip laterally, and a longitudinally-movable block in the intermediate strip.



4. The combination with a square having an arm thereto; of a strip parallel to one member of the square and to said arm, means for adjusting the strip from or toward the arm, an intermediate strip between the arm and parallel strip, means for adjusting the intermediate strip laterally, a block slidably mounted in a slot in the intermediate strip, and adjusting means for said block.

710,059. BROWN-VIOLET AZO DYE. PAUL JULIUS, Ludwigshafen, Germany, assignor to Badische Anilin und Soda Fabrik, Ludwigshafen, Germany. Filed July 1, 1902. Serial No. 114,022. (No specimens.)

Claim.—The coloring-matter obtainable by means of diazotized 1-chlor-2-naphthylamin-5-sulfo-acid, carbonate of soda, and beta-naphthol, which dyes wool brown-violet shades, which shades on treatment with potassium bichromate and acetic acid become black-blue to black and on treatment with copper sulfate violet, which on reduction with stannous chlorid and hydrochloric acid yields 1.2-amido-naphthol and an amido-naphthol-mono-sulfo-acid, which coloring-matter in the form of its free acid yields with hot water a claret solution, and with concentrated sulfuric acid a violet solution, whose sodium salt is soluble in water yielding a blue solution, which solution on the addition of caustic soda becomes violet.

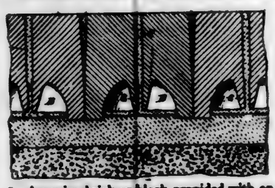
710,060. CAPSULE FOR MEDICINES. DRESDNER & KANN Weinberge, Austria-Hungary, assignor to Arthur Freund, Prague, Austria-Hungary. Filed June 11, 1902. Serial No. 111,234. (No model.)

Claim.—As a new article of manufacture, a dry-closing capsule, consisting of two cup-shaped parts capable of being introduced one within the other, one of said parts having a double wall within which the other part engages, substantially as described.

710,061. SUSPENSION-HOOK. JOHN P. EMES and ANDREW LAUTER, Paterson, N. J. Filed May 24, 1902. Serial No. 108,769. (No model.)

Claim.—A suspension-hook, comprising a body portion and two extension members, integral therewith, the upper member turning and depending from the body forming a broad inverted-U-shaped hook the sides of which are substantially parallel, and the extremity of which curves outwardly, and the lower member turning from the body, projecting upwardly forming a U-shaped hook, opposite the upper hook, and thence extending outwardly forming a somewhat upwardly-inclined arm the outer extremity of which terminates in a short upturned hook, substantially as set forth.

710,062. PAVING BRICK OR BLOCK. WILLIAM J. LEARY, Buffalo, N. Y. Filed Feb. 10, 1902. Serial No. 93,894. (No model.)

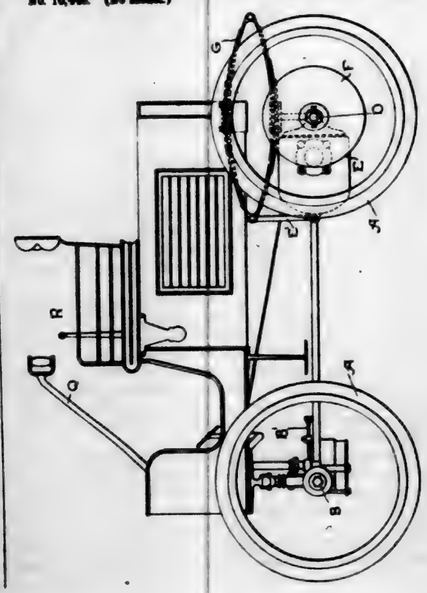


Claim.—1. A paving brick or block provided with an air-chamber a test extending into said air-chamber and an air-vent opening extending through the brick or block and through said test, substantially as set forth.

2. A paving brick or block provided in its under face with a cavity forming an air-chamber, a test extending into said cavity and terminating above the base of the brick, and an air-vent opening extending through the body of the brick or block and through said test, substantially as set forth.

3. A paving brick or block formed with an open cavity in its bottom or base and with a central test extending down into said cavity and terminating above the bottom face of the brick, and an air-vent opening extending vertically through the central portion of the body of the brick and through said test, said air-vent opening being open at its upper and lower ends, substantially as set forth.

710,068. AUTOMOBILE. HERMANN LEMP, Lynn, Mass., assignor to Ellen Thomson, Swampscott, Mass. Filed Mar. 28, 1900. Serial No. 10,448. (No model.)



Claim.—1. The combination, in a vehicle, of fixed front and rear axles, a triangular frame rigidly connected at two points with the front axle and pivotally connected at a single point to the rear axle, driving-wheels, and motors supported on the rear axle and located between the pivotal point of the triangular frame and the driving-wheels.

2. In a vehicle, the combination of front and rear axles both of which are fixed, short movable axles pivotally secured to the front axle, a triangular frame which is rigidly secured at two points to the front axle and at its point or apex to the rear axle, unions or couplings for uniting the frame with the fixed axle, a clamp on the rear axle for pivotally supporting the apex of the frame, and a driving-motor secured on the rear axle and mechanically connected to a driving-wheel.

3. In a vehicle, the combination of a fixed front axle, a fixed rear axle, a triangular frame, a clamp on the rear axle to which the apex of the triangular frame is secured by a horizontal pivot, couplings on the front axle which are widely separated for receiving and holding the diverging ends of the frame, and a motor secured on the axle, to which the frame is pivotally secured.

4. In a vehicle, the combination of fixed front and rear axles, a triangular frame rigidly connected to the front axle at two points and pivotally connected to the rear axle at one point, a vehicle-body, a single spring secured to the front axle and to the body, which spring extends parallel with the axle, a pair of springs secured to, and extending at right angles to, the rear axle for supporting the rear end of the body, and motors mounted one on each side of the pivotal connection.

5. In a vehicle, the combination of two axles, a triangular frame rigidly connected to the front axle at two points and pivotally connected to the rear axle at one point, steering-wheels carried by the front axle, a vehicle-body, a single transversely-extending spring secured to the front axle and to the vehicle-body, a pair of longitudinally-extending springs connected to the rear axle, and motors supported by the rear axle and the longitudinally-extending springs.

6. In a vehicle, the combination of a pair of fixed axles, a triangular frame, a pair of unions for rigidly connecting the diverging ends of the triangular frame with the front axle, a fork for connecting the converging ends of the frame, a clamp on the rear axle, a pivotal connection between the fork and the clamp, a vehicle-body, a single spring mounted on the front axle for supporting the vehicle-body at that point, and a pair of springs extending at right angles to the rear axle and connected to said axle and to the body.

7. In a vehicle, the combination of a front and a rear axle, steering-wheels pivotally secured to one of the axles, a triangular frame the diverging ends of which are rigidly secured to one axle while the opposite ends of the frame are united by a fork, a band or clamp which surrounds the other axle, and a pivot which is mounted in the band or clamp and extends at right angles to the rear axle and engages with the fork for fastening the triangular frame in place.

8. In a vehicle, the combination of a fixed axle, a short steering-axle having a stud thereon, and a frame or hanger rigidly mounted on the fixed axle, comprising two vertically-extending portions, one of said portions being adapted to receive one end of a leaf-spring, the other portion being tubular and arranged to receive the stud of the short steering-axle.

9. As an article of manufacture, a hanger for vehicles, comprising two vertically-extending portions, one of said portions being provided with an opening for receiving a fixed support, and a fork for receiving the end of a leaf-spring, the other portion being tubular and adapted to receive and form a bearing for the steering-axle stud.

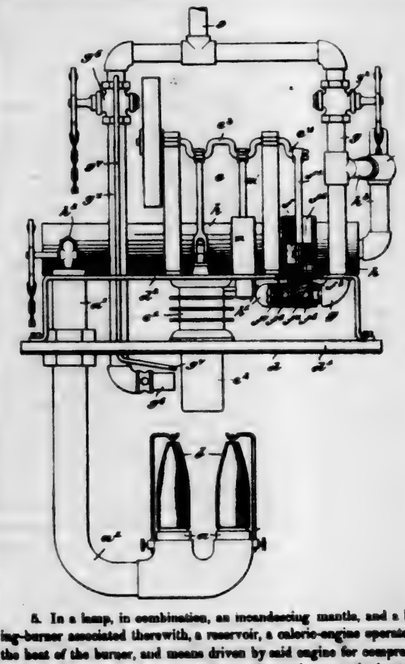
710,064. LAMP. THOMAS J. LITLE, Jr., Cleveland, Ohio, assignor to the New Process Lighting Company, Cleveland, Ohio, a Corporation of Ohio. Filed Jan. 31, 1900. Renewed Feb. 4, 1901. Serial No. 46,003. (No model.)

Claim.—1. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a caloric-engine operated by the heat thereof, means operated by the caloric-engine for compressing a gas, means for causing such compressed gas to escape in a jet, and a passage-way leading from said jet to the burner and adapted to convey the gas and air thereto.

2. In a lamp, the combination of a Bunsen burner, a caloric-engine operated by the heat from said burner, means driven by said engine for compressing the fuel supplied to said burner, and an incandescible material adapted to be rendered luminous by said burner.

3. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a gas-supply pipe, a caloric-engine operated by the heat of said burner, means operated by said engine for compressing the gas from the supply-pipe, means for causing such compressed gas to escape in a jet and carry air with it to the burner, and a lamp-frame carrying all of said parts.

4. In a lamp, in combination, a gas-supply pipe, a caloric-engine and means driven thereby for compressing the gas from such pipe, said engine being operated by the heat generated by burning gas from such pipe, an incandescible material, and a heating-burner associated therewith, and means for causing the compressed gas to escape in a jet thereto and take combustion-supporter with it.



5. In a lamp, in combination, an incandescing mantle, and a heating-burner associated therewith, a reservoir, a caloric-engine operated by the heat of the burner, and means driven by said engine for compressing gas in the reservoir, and means for conveying such gas to the burner.

6. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a reservoir, a gas-supply pipe, a caloric-engine operated by the heat of said burner, and means driven by said engine for compressing in the reservoir gas from the supply-pipe, and means for causing the gas to escape from the reservoir in a jet and carry air with it to the burner.

7. In a lamp, in combination, a reservoir, a gas-supply pipe, a caloric-engine operated by the heat of the burner, means driven by said engine for compressing gas from the supply-pipe in the reservoir, an incandescing mantle, a burner, a burner-pipe leading thereto and having an air-opening, and a discharge-pipe from said reservoir into said burner-pipe.

8. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a conduit leading to said burner and having an opening to the outer air, a reservoir, a gas-supply pipe, a caloric-engine operated by the heat of the burner, means driven by said engine for forcing gas from the supply-pipe into the reservoir under pressure, an exit-pipe leading from said reservoir and discharging into said conduit, and a cock for governing said exit-pipe.

9. In a lamp, in combination, a caloric-engine, a main burner and an initial heating-burner for the same, an incandescible material associated with said main burner, means operated by said engine for compressing gas, means for feeding compressed gas with air to said main burner, and means for feeding the initial-heating burner with uncompressed gas.

10. In a lamp, in combination, an incandescing mantle, a heating-burner associated therewith, a reservoir, a caloric-engine operated by the heat of the burner, means driven thereby for compressing gas in the reservoir, means for conveying the gas from the reservoir to the burner, and a governor limiting the pressure in the reservoir.

11. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a reservior, means operated by the heat of the burner for compressing gas in the reservoir, means for conveying such gas to the burner, and a return-pipe leading from the reservoir to the gas-supply, and a spring-valve for controlling said return-pipe.

12. In a lamp, in combination, a reservoir, a gas-supply pipe, a ca-

loric-engine and means driven thereby for compressing gas from the supply-pipe into the reservoir, an incandescible material, a burner therefor, a burner-pipe leading thereto and having an air-opening, a discharge-pipe from said reservoir into said burner-pipe, and a suspensible frame carrying all of said parts.

13. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a caloric-engine adapted to be operated by the heat thereof, a pump driven by said engine, a reservoir into which said pump discharges, a supply-pipe adapted to convey gas to said pump, whereby the engine may compress the gas in the reservoir, a discharge-pipe leading from said reservoir, and a pipe having an air-opening for conveying such discharge and air to the burner.

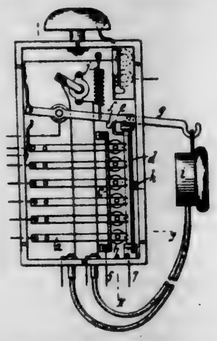
14. In a lamp, in combination, an incandescible material, a heating-burner associated therewith, a caloric-engine operated by the heat thereof, a pump driven by said engine, a reservoir into which said pump discharges, a supply-pipe adapted to convey gas to said pump whereby the engine may compress the gas in the reservoir, a discharge-pipe leading from said reservoir, a pipe for conveying such discharge and air to the burner, a return-pipe leading from the reservoir to the fuel-supply, a spring-valve for governing the same, and cocks in the supply-pipe and discharge-pipe respectively.

15. In a lamp, the combination with an incandescible material, a heating-burner associated therewith, a caloric-engine which converts a portion of the waste heat from said burner into rotary mechanical movement, mechanism operated by such rotary movement for compressing the gas, and means for causing such compressed gas to escape in a jet to said burner whereby it may take air with it.

16. In a lamp, in combination, an incandescible material, a burner therefor, a burner-pipe leading to the burner and having an opening for the reception of air, a caloric-engine above the incandescible material, a heat-diaphragm across the engine for maintaining the upper portion thereof cool, a pump operated by said engine, a gas-supply pipe leading thereto, a reservoir into which said pump is adapted to discharge, and a discharge-pipe from said reservoir to said burner-pipe.

17. In a lamp, in combination, a caloric-engine, a main burner, and an initial-heating burner for the same, an incandescible material associated with said main burner, a reservoir, a pump operated by said engine for compressing gas from the supply into said reservoir, a burner-pipe leading to said main burner, a jet-pipe from the reservoir discharging into said burner-pipe, and two gas-supply pipes branching from a common pipe and one leading to said pump and the other to said initial-heating burner.

710,065. SELF-RESTORING TELEPHONE. LOUIS J. LOMPLER, New York, N. Y. Filed Oct. 22, 1901. Serial No. 79,740. (No model.)

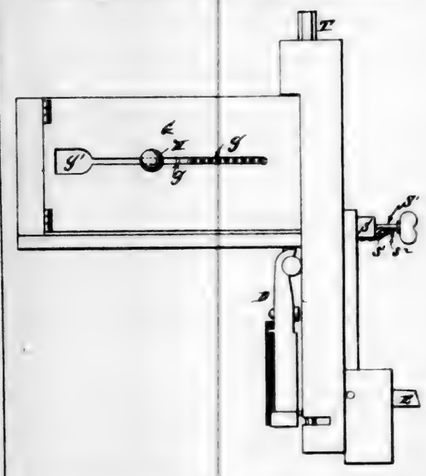


Claim.—1. A signal-wire terminal, a swinging catch forming a talking-wire terminal, a spring for moving the catch to engaging position, an arm carried by the catch, a releasing nose or incline for the catch made to engage the arm, a weight-actuated lever on which said incline is mounted, a contact-spring made to normally move clear of the terminals, and a button or handle for moving the contact to the signal-terminal, said contact-spring being adapted for engagement by the catch when released to clear the signal-terminal substantially as described.

2. A swinging spring-pressed catch forming a talking-circuit terminal and having an inclined and shoulder portion, a push-button and line contact-spring made to contact with the incline to retract or pass the catch and to be held by or make talking contact with the shoulder when the push-button is freed, a ringing-circuit bar with which the contact-spring closes when pressed by the button past or clear of the shoulder, said spring being made to return to and be held by the shoulder clear of the ringing-circuit on the release of the button, a receiver-carrying hook or lever having a nose, and an arm on the swinging catch engaged by the nose for forcing the catch to release the line contact-spring, the latter being made to normally spring away from or clear both the ringing and talking circuits substantially as described.

3. A signal-wire terminal and a talking-wire terminal combined with a contact-spring normally out of contact with both terminals and made to contact with either terminal while clear of the other terminal, means for causing the engagement of said contact-spring with one of said terminals, a pawl engaging the contact-spring for retaining the same in engagement with the other of said terminals, a spring engaging said pawl for retaining it in engagement with the said contact-spring, an arm connected with said pawl, a lever, and a nose carried by the lever and engaging the said arm for releasing the pawl from its engagement with the said contact-spring.

710,066. TYPE-DISTRIBUTING APPARATUS. ABBOT A. LOW, Brooklyn, N. Y., assignor to Alden Type Machine Company, New York, N. Y. Filed Jan. 29, 1901. Serial No. 45,194. (No model.)



Claim.—1. In type-distributing apparatus, the combination of a vertical type-galley, vertically-movable type-line-transfer plate, a vertical movable type-line cut-off or follower and type-feeling mechanism, arranged and operating substantially in the manner and for the purpose described.

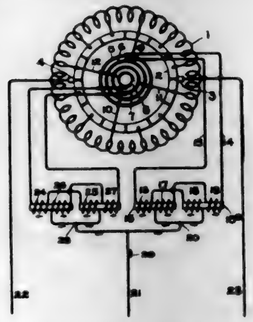
2. In type-distributing apparatus, the combination of a vertical type-galley A, line-forwarder A, formed with the handle H, the retractable transfer-plate P, for lowering the types into the feeler-channel C, the type-line cut-off and follower T, and the type-feeling mechanism, all arranged and operating substantially in the manner and for the purpose described.

3. In type-distributing apparatus, the combination of the galley A, the distributer-frame formed with the vertical feeler-channel C, the retractable and vertically-movable transfer-plate P, the type-line cut-off T, type-feeling mechanism and a vertical cover G, upon the galley A, for the purpose of sustaining the types in the galley A, substantially in the manner described.

4. In type-distributing apparatus, the combination with the vertical galley A, type-line cut-off T, the frame formed with the vertical feeler-channel C, and type-feeling mechanism, of the transfer-plate P, extending through the vertical slot f^3, and mounted upon the end of the spring-bolt S', upon the vertical movable cross-head S, said bolt S', being forced with a shoulder s', for engagement with the ends of a ratchet-spring s^2, and with a flange p, for the purpose and substantially in the manner described.

5. In type-distributing apparatus, the combination with the type-line cut-off T, retractable transfer-plate P, of a vertical galley A, provided with a cover G, formed with a horizontal slot g, said galley being also provided with a line-forwarder A, the handle of which H, is formed with notches h', for the reception of the edges of the slot g, whereby the handle H, is made to lock the cover G, in position, during the forward movement of the line-forwarder, substantially in the manner and for the purpose described.

710,067. SYSTEM OF ELECTRICAL DISTRIBUTION. ALEXANDER D. LEVY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Jan. 31, 1901. Serial No. 45,488. (No model.)



Claim.—1. The combination of a plurality of inductance-coils, the windings of which are traversed by superposed alternating and direct current, and connections between said windings such that the direct current has no resultant magnetizing effect.

2. The combination of a plurality of cores, windings on said cores traversed by superposed alternating and direct current, and connections between the said windings such that there is no resultant magnetizing effect due to the direct current.

3. The combination of a plurality of cores of magnetic material, a plurality of windings on each of said cores, and connections interlinking all of the windings in series, the connections being such that no two windings on a single core are interlinked in immediate succession.

4. The combination of a plurality of cores of magnetic material, a plurality of windings on each of said cores, means for passing superposed alternating and direct current through said windings, and connections between said windings such that the direct current in one of the windings on a core is balanced in its magnetizing effect by direct current in another of said windings.

5. The combination of an armature, a plurality of windings connected in series across points in said armature, means for passing direct current through said windings, and connections between said windings such as to render negligible the resultant magnetizing effect of the direct current in said windings.

6. The combination with the armature-winding of a dynamo-electric machine, of a commutator connected to said winding, sets of inductively-related coils, a main leading to a connection between two of the coils, and interconnections between the coils such that current in said main has no resultant magnetizing effect.

7. The combination of a plurality of series-connected sets of inductively-related coils, a main leading to a connection between two of the coils, the interconnection between all of the coils being such that current in said main has no resultant magnetizing effect, and means for supplying current to said main.

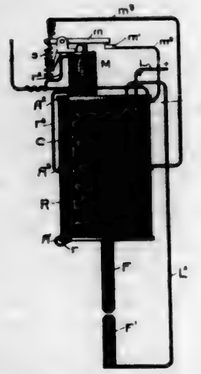
8. The combination of a plurality of cores of magnetic material, a plurality of windings on each of said cores, connections interlinking said windings in series, means for passing alternating current through said windings in series, and means for passing direct current through a divided or branched circuit formed of said windings.

710,068. METHOD OF MAINTAINING UNIFORM RESISTANCE IN ARC-LAMP CIRCUITS. RUFUS G. LEBARON, Boston, Mass., and WILLIAM A. PAINE and EVERETT W. BURDETT administrators of Frederick A. Gilbert, deceased. Original application filed Dec. 17, 1897, Serial No. 662,234. Divided and this application filed Apr. 26, 1902. Serial No. 105,314. (No model.)

Claim.—1. The method of regulating electric-arc lamps having series and shunt regulating-coils, which consists in varying the regulating power of said coils when the heat after starting the lamp, inversely to, and to compensate for, change of voltage at the arc accompanying such heating.

2. The method of regulating arc-lamps having series and shunt arc-regulating coils, which consists in automatically cutting out a part of one of said coils when it heats after starting the lamp, to compensate for the change of voltage at the arc accompanying such heating.

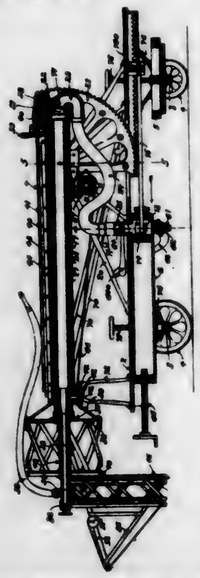
3. The method of regulating electric-arc lamps having series and shunt regulating-coils, which consists in increasing the power of the shunt-coil when it heats after starting the lamp, to compensate for the increased voltage at the arc accompanying the rise of coil resistance due to such heating, whereby the shunt-winding is rendered uniform in the starting and running condition of the lamp, and the length of arc is also maintained uniform.



4. The method of regulating electric-arc lamps and maintaining uniform arc length, which consists in automatically controlling the operation of the feed-regulating circuit when it heats after starting the lamp, by, and to compensate for, variation of voltage at the arc accompanying the change of coil resistance due to such heating.

5. The method of regulating electric-arc lamps, which consists in automatically increasing the effective power of the feed-controlling circuit to compensate for loss of power due to heating of the circuit when the voltage at the arc rises as a consequence of such heating to a determinate degree.

710,069. FIRE-EXTINGUISHING AND LIFE-SAVING APPARATUS. WALTER A. HERRESOFF, Houlton, Me. Filed July 6, 1901. Serial No. 67,262. (No model.)



Claim.—1. An apparatus of the character referred to, comprising a body, a telescopic water-tower pivotally connected with the body, a fixed cylinder attached to the body, a supply-pipe entering the inner end portion of the cylinder and adapted for connection with a source of water-supply, a conduit having a flexible portion connecting the inner end portion of the cylinder with the tower, a piston in the cylinder and having

its rod provided with a cross-head, gearing connecting the piston with the tower, said gearing comprising racks attached to said cross-head and gear-segments connected with said tower, and a valve in the said conduit between the cylinder, and tower, whereby water admitted to the cylinder at the said inner end thereof may be first confined therein and caused to swing the tower upwardly, and may then be admitted to the tower to extend the latter.

2. An apparatus of the character referred to, comprising a vehicle-body, a fixed cylinder thereon having duplicate supply-pipes entering its inner end portion from opposite sides, automatic outwardly-closing check-valves at the inner ends of said pipes, whereby when either pipe is in use the other is kept closed by the liquid-pressure in the cylinder, a piston in the cylinder, a swinging tower having direct fluid connection with the said inner portion of the cylinder, and mechanical connections between the piston and tower, said connections comprising a cross-head and racks connected with the piston-rod and gear-segments connected with the tower.

3. An apparatus of the character referred to, comprising a fixed cylinder having a supply-pipe entering its inner end portion, a swinging tower, direct liquid connections between the inner end portion of the cylinder and the tower, a piston in the cylinder, a piston-rod passing out from the inner end of the cylinder, mechanical connections between the piston-rod and the tower, said connections comprising a cross-head and racks connected with the piston-rod and gear-segments connected with the tower, and a valved outlet at the inner end portion of the cylinder.

4. An apparatus of the character referred to, comprising a cylinder having a supply-pipe entering its inner end portion, a swinging tower, liquid connections between the inner end portion of the cylinder and the tower, a piston in the cylinder, mechanical connections between the piston and the tower, and an adjustable rigid stop located in the path of movement of the liquid-impelled mechanism whereby the movement of the piston and the tower-raising parts connected therewith may be arrested at any desired point.

5. An apparatus of the character referred to, comprising a fixed cylinder having a supply-pipe entering its inner end portion, a swinging tower, direct liquid connections between the inner end portion of the cylinder and the tower, a piston in the cylinder, a piston-rod passing out from the inner end of the cylinder, mechanical connections between the piston-rod and the tower, said connections comprising a cross-head and racks connected with the piston-rod and gear-segments connected with the tower and a valved outlet at the lower portion of the tower.

6. In an apparatus of the character referred to, a water-tower comprising an oscillating base-section secured against longitudinal movement, a sliding intermediate section within the base-section, a sliding end section within the intermediate section, and a telescopic ladder composed of a base-section attached at both ends to the base-section of the tower, and intermediate and end sections attached at their upper ends to the upper ends of the intermediate and top sections of the tower respectively, the intermediate section being narrower than and guided and confined between the side bars and rungs of the base-section, while the top section is narrower than and guided between the side bars and rungs of the intermediate section, the side bars of the base and intermediate sections of the ladder being made of flight-pieces having a uniform shape in cross-section to form tracks or guides for the next narrower section.

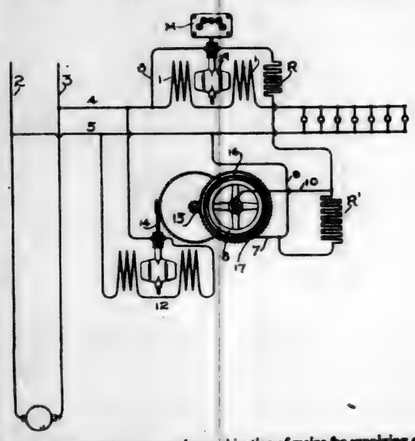
7. An apparatus of the character referred to, comprising a telescopic water-tower, a hydrant on the top section of the tower, a sleeve or collar surrounding the hydrant, a platform affixed to the said top section, a railing around said platform, a telescopic platform the inner section of which is secured to and partially supported by said sleeve or collar, and is additionally supported by said railing.

8. An apparatus of the character referred to, comprising a telescopic water-tower, a hydrant on the top section of the tower, a sleeve or collar surrounding the hydrant, a platform affixed to the said top section, a railing around said platform, a telescopic platform the inner section of which is secured to and partially supported by said sleeve or collar, and is additionally supported by said railing, a guy-rope-supporting frame affixed to said inner section, and a guy-rope adjustably secured to said frame and connected with the outer section of the telescopic platform.

9. A water-tower section having a cup-washer at its lower portion, clamping-collars engaged with the flange of said washer, one collar being above and the other below said flange, and screws entering the upper collar, the heads of said screws being countersunk in the said upper collar whereby the screws may be prevented from removal by the inner wall of another section.

710,070. APPARATUS FOR SUBSTRATE SECTIONING. BENJAMIN GELST, Lynn, Mass., assignor to the General Electric Company, a Corporation of New York. Filed Mar. 6, 1899. Serial No. 707,172. (No model.)

Claim.—1. In a metering system, the combination of supply-mains, a meter or meters for recording the amount of energy consumed at the various points of consumption, means capable of changing the rate of registration of the meters, and an automatic control apparatus operated by current derived from the system for actuating said means.



2. In a metering system, the combination of mains for supplying current to the consumers, meters for recording the consumption of energy, a resistance capable of being inserted in the circuit in a manner to change the rate of registration of the meters, and an automatic control apparatus operated by current received from the system for inserting and withdrawing the resistance from the circuit.

3. In a metering system, the combination of supply-mains, meters for recording the amount of energy consumed at the various points of consumption, a resistance device capable of changing the rate of registration of the meters, and automatically-actuated apparatus receiving current from the supply-mains for operating the resistance device.

4. In a system of electrical distribution, the combination with a suitable metering mechanism located at a single point of consumption, of a resistance capable of being inserted in and withdrawn from a circuit of said metering mechanism, and an automatic control apparatus operated by current derived from the system at said point of consumption, to insert and withdraw said resistance, at predetermined hours, substantially as described.

5. In a system of electrical distribution, the combination with a suitable metering mechanism installed at a single point of consumption, of a resistance capable of insertion in and withdrawal from the shunt-circuit of said metering mechanism, a time-controller, to vary the hour of insertion and withdrawal, and a meter-control operated by current derived from the system to actuate said limit-controller continuously, after the latter is set, substantially as described.

6. In a system of electrical distribution, the combination with a suitable metering mechanism, of means for reducing the speed, or rate of registration of current, during predetermined hours, a time-controller capable of adjustment to fix said hours, and a local controller consisting of a motor continuously actuated by current derived from the system, substantially as described.

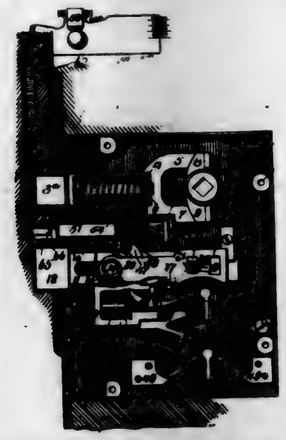
7. In a system of electrical distribution, the combination with a suitable metering mechanism located at a point of consumption, of a time-controller composed of two parts, one having constant movement relatively to the other, and a local meter-controller operated by current derived from the system to impart said movement, substantially as described.

8. In a system of electric metering, the combination of a plurality of meters located at the various points of consumption, each meter being arranged to register at more than one rate, and a single automatic control device operated by current received from the system for changing the rate at which the meters register.

9. In an electric metering system the combination of means for indicating the consumption of energy, two circuits controlling the recording apparatus, and an automatic control apparatus receiving current from the supply-lines for rendering either circuit operative.

710,071. LOCK. WILLIAM B. FAHEN and HENRY A. ROOSE, Chicago, Ill. Filed Mar. 1, 1902. Serial No. 96,252. (No model.)

Claim.—1. In a device of the character described, the combination with a lock having a casing, of slidable means in said casing adapted to be normally held in a retracted position, and means in said casing adapted when engaged by a false key to release said first-named means and allow the same to shoot forward into position to prevent the withdrawal of said false key.



2. In a device of the character described, the combination of a lock-casing provided with an auxiliary keyhole, notched plates secured to the casing at each side of the said keyhole adapted to correspond with the wards of the key, a gripping-frame slidably mounted in the casing, and means secured to the casing for holding said frame normally in the retracted position, substantially as described.

3. In a device of the character described, the combination with a lock-casing having an auxiliary keyhole formed therein, of notched guard-plates secured to the casing at opposite sides of the keyhole, a gripping-frame mounted to slide in the casing of the lock, a spring-held trigger engaging the gripping-frame to hold the same normally retracted, and means adapted when the trigger is released to project the gripping-frame into the path of travel of the key.

4. In a device of the character described, the combination of a lock-casing having an auxiliary keyhole, guard-plates secured at opposite sides of said keyhole, a spring-pressed gripping-frame slidably mounted in the lock-casing, and a spring-held trigger normally holding said frame in the retracted position, the end of said trigger projecting into the path of travel of the key and notched to permit the passage of the proper key, substantially as described.

5. In combination with a lock having a casing provided with a main and an auxiliary keyhole, means secured at opposite sides of the auxiliary keyhole for preventing the rotation of a false key after insertion into the casing, a gripping-frame slidably mounted in the casing and adapted when released to project into the path of travel of a key inserted through the main keyhole, and means for holding said gripping-frame normally in the retracted position, said means adapted to prevent the rotation of a false key inserted into the casing through the main keyhole, substantially as described.

6. In combination with a lock having its casing provided with a main keyhole and an auxiliary keyhole, spring-actuated means adapted to be engaged by a false key inserted through the main keyhole, spring-actuated means adapted to be released when the said first-named means is actuated by the false key whereby the second-named means is shifted to a position in the casing to prevent the removal of the false key, and means for locking said second-named means in the shifted position.

7. In combination with a lock having its casing provided with a main keyhole and an auxiliary keyhole, spring-actuated means adapted to be engaged by a false key inserted through the main keyhole, spring-actuated means adapted to be released when the first-named means is actuated by the false key whereby the second-named means is shifted to a position in the casing to prevent the removal of the false key, and means within the casing to prevent the rotation of a false key therein after insertion through the false keyhole.

8. In combination with a lock having its casing provided with a main keyhole and an auxiliary keyhole, spring-actuated means adapted to be engaged by a false key when inserted through the main keyhole, spring-actuated means adapted to be released when the first-named means is actuated by the false key whereby the second-named means is shifted to a position within the casing to prevent the removal of the false key, means for locking said second-named means in the shifted position, and means within the casing to prevent the rotation of a false key therein when inserted through the auxiliary keyhole, substantially as described.

9. In combination with a lock having a casing provided with a keyhole, and an alarm electrically connected to the lock, of means whereby the lock-bolt of the lock may be operated by the proper key without completing the circuit to the alarm, and means adapted when actuated by a false key to simultaneously shift into position to prevent the withdrawal of said false key and to complete a circuit with said alarm.

10. In a lock, the combination with the lock-casing having a main keyhole, and an alarm electrically connected to the lock, of means for operating the lock-bolt by the proper key without completing the circuit to said alarm, and spring-actuated sliding means arranged in the casing adapted when actuated by a false key to simultaneously shift into position to prevent removal of the false key and to complete a circuit to the alarm, substantially as described.

11. In a lock, the combination of a casing having a main keyhole and an auxiliary keyhole, a latch-bolt and a lock-bolt arranged within the casing and operative independently, an alarm electrically connected to the lock and normally out of circuit therewith, and means arranged within the lock-casing and adapted when actuated to shift into position to prevent the withdrawal of the actuating-key and to simultaneously complete a circuit to the alarm.

12. In a lock, the combination with the lock mechanism including a lock-bolt, and an alarm electrically connected to the lock mechanism but normally out of circuit therewith, of means whereby the lock-bolt may be operated by the aid of the proper key without completing the circuit to the alarm, and means adapted when actuated by a false key to complete the electrical circuit to said alarm, substantially as described.

13. In a lock, the combination with the lock mechanism including a lock-bolt, operative by the proper key to desired positions without operation of the other parts of the lock mechanism, of means adapted when actuated by a false key to be shifted into position to prevent the removal of said key and to simultaneously release mechanism to sound an alarm.

14. In a lock, the combination with the lock mechanism, and the casing having a main and an auxiliary keyhole, of spring-actuated means arranged within the casing and adapted when released by a false key inserted in the main keyhole to be shifted into position to prevent the removal of the false key, substantially as described.

15. In a lock, the combination with the lock mechanism, and the casing having a main keyhole and an auxiliary keyhole, of spring-actuated means slidably arranged within the casing and adapted when released by a false key inserted through the main keyhole to be shifted into position to prevent the removal of the false key, substantially as described.

16. In a lock, the combination with the lock mechanism, and the casing having a main keyhole and an auxiliary keyhole, of spring-actuated means slidably arranged within the casing and adapted when released by a false key inserted through the main keyhole to be shifted into position to prevent the removal of the false key, and means for locking the first-named means in the shifted position, substantially as described.

17. In a lock, the combination with the lock mechanism, and the lock-casing having a main keyhole, and an auxiliary keyhole, of notched guard-plates arranged at opposite sides of the auxiliary keyhole, as and for the purpose described.

18. In a lock, the combination with the lock mechanism, and the lock-casing having a main keyhole and an auxiliary keyhole, of means actuated only by a false key inserted through the main keyhole to prevent the removal of said false key, substantially as described.

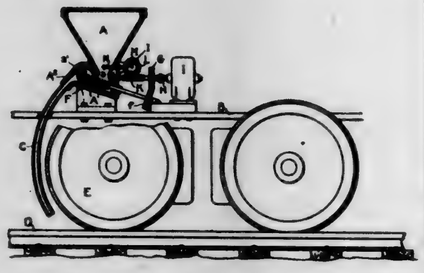
19. In a lock, a lock-bolt operative by the proper key when inserted through the main keyhole in the casing, means held normally retracted in the casing and adapted when released by a false key inserted through the main keyhole to project into the path of travel of said key, a spring-arm for locking said means in its projected position, and guard-plates disposed to prevent the release of the said means by a secondary false key inserted into the lock, substantially as described.

20. In a lock, a casing having a main and a false or auxiliary keyhole, a lock-bolt operative by a proper key inserted through the main keyhole, means adapted to project into the path of travel of a false key when inserted into the main keyhole to prevent the removal of said false key, and an alarm-circuit closer automatically operated by said means, substantially as described.

21. In a lock, the combination with the casing having a main and an auxiliary keyhole, of the lock mechanism, the circuit-closing device, and the false-key-retaining device, substantially as described.

710,072. ELECTRIC-RAILWAY SYSTEM. WILLIAM B. POTTER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Feb. 28, 1901. Serial No. 48,217. (No model.)

Claim.—1. The combination with an electric-railway car, of a sanding device comprising a rotatable conveyer, a rotating electric motor connected therewith, and means whereby the motorman can start and stop said motor at will.



2. The combination with an electric-railway car, of two or more sanding devices each comprising a rotatable conveyer, a rotating electric motor for each, and circuit connections whereby the motorman can start and stop said motors at will.

3. The combination with an electric-railway car, of two or more sanding devices each provided with an electromagnetic operating mechanism, and circuits connecting said mechanisms in multiple.

4. The combination with one or more electric-railway cars, of two or more sanding devices on each car, a rotating electric motor for operating each device, and means for simultaneously connecting said motors in multiple.

5. In combination, a plurality of cars united to form a train, sand-boxes on some or all of said cars, electric motors controlling the delivery of sand therefrom, a train-conductor to which said motors are connected, a source of current-supply, and means located at several desired points on the train for connecting said conductor to said source of supply.

710,078. ELASTIC TIP. PHILIP W. PRATT, Boston, and ROLOF B. FOSTER, Revere, Mass., assignors to Daniel S. Pratt, Brookline, Mass. Filed Dec. 28, 1901. Serial No. 87,501. (No model.)

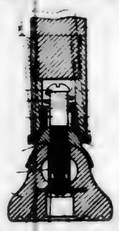
Claim.—1. An elastic tip forming the bottom of a socket and having an annular flange forming the wall of the socket, the body portions of said tip and flange being of elastic vulcanized rubber, and an inextensible reinforcing layer of frictioned stock vulcanized to said tip between its tread-surface and the socket-cavity.

2. An elastic tip forming the bottom of a socket and having an annular flange forming the wall of the socket, the body portions of said tip and flange being of elastic vulcanized rubber, and an inextensible reinforcing layer of frictioned stock vulcanized to said tip between its tread-surface and the socket-cavity, said layer having a flange surrounding the socket-cavity.

3. An elastic tip having suitable means for attachment to a chair, crutch or cane, the body portion of said tip being of elastic vulcanized rubber, and a frictional tread composed of a strip of frictioned textile material formed into dished or tapered convolutions which are vulcanized to each other and to the elastic body of the tip.

4. An elastic tip forming the bottom of a socket and having a flange forming the wall of the socket, the body portion and flange being of elastic vulcanized rubber, a relatively inelastic tread-piece attached to the lower side of the elastic body of the tip, and an inextensible reinforcing layer of frictioned stock vulcanized to the tip between the tread-piece and the socket-cavity, said reinforcing layer having a flange extending upwardly and surrounding the socket-cavity.

710,074. CRUTCH, CANE, &c. PHILIP W. PRATT, Boston, Mass. Filed Feb. 27, 1902. Serial No. 95,916. (No model.)



Claim.—1. A crutch or cane comprising a body having a rigid annular socket member at its lower portion, a ball member fitted to oscillate in said socket member, a stud affixed rigidly to the ball member and projecting therefrom through the opening of the socket member and movable laterally therein, a spring engaged with said stud and with a fixed abutment within said body, said spring and stud holding the ball member yieldingly against the socket member and permitting one member to oscillate on the other, and an elastic tread secured to the ball member.

2. A crutch or cane comprising a body having a rigid annular socket member at its lower portion, a ball member fitted to oscillate in said socket member, a stud affixed rigidly to the ball member and projecting therefrom through the opening of the socket member and movable laterally therein, a spring engaged with said stud and with a fixed abutment within said body, said spring and stud holding the ball member yieldingly against the socket member and permitting one member to oscillate on the other, an elastic tread, and means for detachably securing the said tread to the ball member.

3. A crutch or cane comprising a body having a rigid annular socket member at its lower portion, a ball member fitted to oscillate in said socket member, a stud affixed rigidly to the ball member and projecting therefrom through the opening of the socket member and movable laterally therein, a spring engaged with said stud and with a fixed abutment within said body, said spring and stud holding the ball member yieldingly against the socket member and permitting one member to oscillate on the other, a shank attached to and extending downwardly from the ball member, and an elastic tread attached to said shank.

4. A crutch or cane comprising a body having a rigid annular socket member at its lower portion, a ball member fitted to oscillate in said socket member, a stud affixed rigidly to the ball member and projecting therefrom through the opening of the socket member and movable laterally therein, a spring engaged with said stud and with a fixed abutment within said body, said spring and stud holding the ball member yieldingly against the socket member and permitting one member to oscillate on the other, a shank attached to and extending downwardly from the ball member and provided with a footpiece at its lower portion, and an elastic tread attached to said shank and footpiece.

5. A crutch or cane comprising a body having a rigid annular socket member at its lower portion, a ball member fitted to oscillate in said socket member, a stud affixed rigidly to the ball member and projecting therefrom through the opening of the socket member and movable laterally therein, said stud having a threaded extension projecting downwardly through and below the ball member, a spring engaged with said stud and with a fixed abutment within said body, said spring and stud holding the ball member yieldingly against the socket member and permitting one member to oscillate on the other, a tubular shank engaging said threaded extension, and an elastic tread attached to said shank.

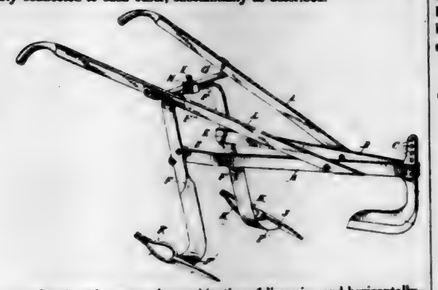
6. An elastic tread-piece provided with a rigid attaching member embedded in the tread-piece, and a flexible footpiece secured to the inner end of said attaching member and having its marginal portion embedded in the tread-piece.

710,075. BEET-HARVESTER. JOHN J. ROCKUS, Zeeland, Mich. Filed Jan. 27, 1902. Serial No. 91,433. (No model.)

Claim.—1. In a beet-harvester two separate diggers adapted to operate upon separate rows of beets, a frame connecting the same, and a blade attached to the frame and adapted to enter and traverse the soil and prevent lateral movement of the frame, substantially as described.

2. In a beet-harvester a post having a blade at the lower end adapted to enter and traverse the soil, rearwardly extended and diverging bars attached to the post, posts attached to the rear of the bars and having diggers attached at their lower ends and inwardly-extended upper ends adjustably secured to a cross-bar, and handles connected to the ends of the cross-bar and to the first-named bars, substantially as described.

3. In a beet-harvester the combination of diverging and horizontally-flexible bars, rigidly connected at the forward ends, and posts attached to the respective rear ends, and having diggers attached to the lower ends, and having flexible upper ends extending upward and inward and adjustably connected to each other, substantially as described.



4. In a beet-harvester the combination of diverging and horizontally-flexible bars, bent in parallel ends at the ends and rigidly attached at the front ends, posts attached at the rear ends of the bars and extending downward and thence outward, diggers attached to the outer ends of the posts to operate upon separate rows of beets, said posts also extending upward and inward and adjustably secured to a cross-bar, and handles attached to the respective ends of the cross-bar and to the diverging bars, substantially as described.

5. In a beet-harvester a post at the front having a blade at the bottom, diverging and rearwardly-extended bars attached to the post, posts attached to the rear ends of the bars, and extending downward therefrom, diggers on the lower ends of the posts to operate on separate rows of beets, said posts also extending upward and inward and having their inner ends overlapping and adjustable, a cross-bar, a clip, surrounding the cross-bar and overlapping ends of the posts, and handles attached to the cross-bar and to the first-named bars substantially as described.

6. In a beet-harvester, a frame, a post attached to the frame and having a laterally-extended lower end, and rearwardly and upwardly extended fingers attached to the said lower end, substantially as described.

7. In a beet-harvester, a frame, a post attached to the frame and having a laterally-extended lower end and a forwardly-projecting point, and rearwardly-projecting fingers attached to the said lower end, substantially as described.

8. In a beet-harvester, a frame, a post attached to the frame and having a laterally-extended lower end, a point attached to the post, and upwardly and rearwardly extended and converging fingers at the rear of the point, substantially as described.

9. In a beet-harvester, a frame, a post attached to the frame and having a laterally-extended lower end, and upwardly and rearwardly extended converging and flexible fingers attached to said lower end, substantially as described.

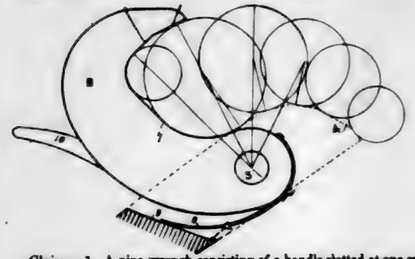
10. In a beet-harvester means for severing the soil at the side of the row of beets and for loosening the soil beneath the same, and upwardly-inclined and converging flexible fingers attached to the said means, substantially as described.

11. In a beet-harvester, a frame, a post attached to the front of the frame and having a blade to enter the soil and guide the frame, posts attached to the respective sides of the frame and having outwardly-turned lower ends, and points and inwardly-projecting upwardly-inclined fingers attached to the said ends, substantially as described.

710,076. HOSPITAL-MATTRESS. DORA T. ROSETT, New York, N. Y. Filed May 28, 1901. Serial No. 62,236. (No model.)

Claim.—An improved hospital-mattress, comprising a plurality of longitudinal sections each complete and indivisible in itself, and means operable by a single movement for detachably associating and securing said indivisible individual longitudinal sections together in composite separable form to form a mattress which is divisible longitudinally only, whereby a mattress is produced in which the complete longitudinal sections may be separately removed from the bed and reassociated one side portion at a time substantially without disturbing the occupant of the bed.

710,077. PIPE-WRENCH. CHARLES C. RUDGER, Butte, Mont. Filed Nov. 29, 1901. Serial No. 83,967. (No model.)



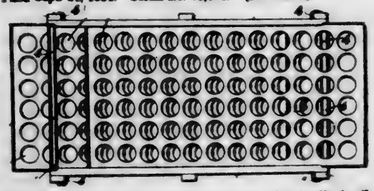
Claim.—1. A pipe-wrench consisting of a handle slotted at one end, a movable jaw pivoted in said slot, a fixed jaw on the handle in relation to said movable jaw, said jaws adapted to engage pipes of various sizes, the relation of the grip-surfaces of said jaws being such that the angle between a pipe-radius perpendicular to the engaged surface of the fixed jaw, and a line from the center of said pipe to the center of the pivot of said movable jaw is less than twenty degrees.

2. The combination in a wrench of a lever having a fixed jaw, the outer portion of said jaw being made polygonal, a hook-jaw pivoted on said lever and movable in relation to said fixed jaw, a portion of the gripping-surface of said hook-jaw, adjacent to the lever, indented to arcs corresponding to the peripheries of pipes to be taken by the wrench, and the outer portion of the grip-surface of said jaw consisting of a plurality of plane surfaces tangential to an arc struck from the pivot of said jaw.

3. A wrench consisting in the combination of a lever, a longitudinal slot in said lever, a hook-jaw pivoted and movable in said slot, a fixed jaw in relation to said movable jaw, said fixed jaw having polygonal faces which subtend an arc eccentric to the pivot of the movable jaw, said jaws so adapted to engage a pipe that the angle between a pipe-radius that is perpendicular to the engaged face of the fixed jaw, and a line from the center of the pipe to said pivot, is less than twenty degrees, a spring fixed to the hub of the movable jaw and movable in the slot in which said jaw operates, and a trigger upon said movable jaw.

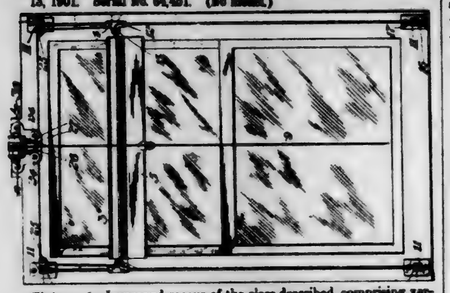
4. In a wrench, the combination with a lever forked at one end and having the ends of the fork members formed as a polygonal-faced jaw or cam and with certain of the faces of the cam having serrations and certain other portions made plane-surfaced, and a hook-jaw pivotally mounted between the forks in relation to the fixed jaw, the relation of the grip-surfaces of the jaws being such that the angle between a pipe-radius perpendicular to the engaged surface of the fixed jaw, and a line from the center of the pipe to the axis of the movable jaw is less than twenty degrees.

710,078. EGG-STAND. JACOB SALOMON, San Francisco, Cal. Filed Sept. 21, 1901. Serial No. 76,071. (No model.)



Claim.—An egg-stand comprising standards, longitudinal rails connected with said standards and having grooves on their inner sides, said grooves being open at both ends and unobstructed from end to end, trays of sheet metal perforated to contain eggs sliding in said grooves, and wire ties 4 connecting the standards across the ends of the stand at points sufficiently below the level of the tray above the same to permit the lower ends of the eggs to pass thereover, and sufficiently above the tray below the same to permit the upper ends of the eggs in said tray to pass thereunder, the space between the standards at the ends being otherwise unobstructed, substantially as described.

710,079. MEANS FOR SUSTAINING AND ADJUSTING WINDOW-SHADES. ANTHONY SERAPIGNI, Jersey City, N. J. Filed June 13, 1901. Serial No. 64,451. (No model.)



Claim.—1. Improved means of the class described, comprising vertical guides secured at the sides of the window and embodying sockets provided with set-screws at the top and bottom of the window-frame, those at the top provided at one side with pulleys and rods having their ends secured in said sockets, sleeves slidable on said guides and provided at one side with sockets, a shade-roller carried by said sockets, a windlass mounted at the top of the window and provided with three annular peripheral grooves, said windlass having on one of its heads pivoted dogs adapted normally to engage sockets in the windlass-spindle, flexible devices connected with the slidable sockets and extending over pulleys to and winding around the end grooves in the windlass and a flexible device wound around the middle groove of the windlass.

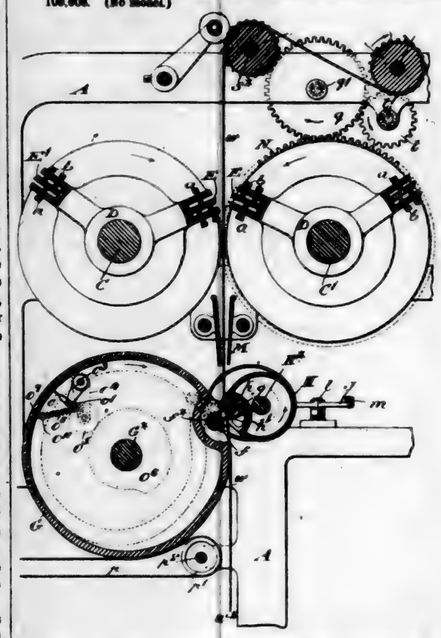
2. Improved means of the class described, comprising vertical guides secured at the sides of the window-frame and embodying sockets provided with set-screws at the top and bottom of the window-frame, those at the top provided at one side with pulleys and rods having their ends secured in said sockets, a shade-roller, sockets adapted to receive the ends of the roller and provided at one side with a vertical opening through which the guides pass, a windlass mounted at the top of the window-frame and provided with three annular peripheral grooves, said windlass having on one of its heads pivoted dogs adapted normally to engage sockets in the windlass-spindle, flexible devices each connected at one end with one of the sockets and at the other end with one of the end grooves of the windlass, a flexible device connected at one end with the middle groove of the windlass, and guards whereby such flexible devices are prevented from displacement upon the windlass and pulleys.

3. Improved means of the class described, comprising vertical guides adapted to be detachably secured at the sides of the window-frame and embodying sockets provided with set-screws at the top and bottom of the window-frame, those at the top provided at one side with pulleys and rods having their ends secured in said sockets, sleeves slidable on said guides and provided at one side with sockets, a shade-roller having its ends secured in said sockets, a windlass mounted at the top of the window-frame and provided with three annular peripheral grooves, said windlass having on one of its heads pivoted dogs adapted normally to engage sockets in the windlass-spindle, flexible devices each connected at one end with one of the sockets and at the other end with one of the end grooves of the windlass, a flexible device connected at one end with the middle groove of said windlass, and guards whereby such flexible devices are prevented from displacement upon the windlass.

4. Improved means of the class described, comprising vertical guides secured at the sides of the window-frame and embodying sockets provided with set screws at the top and bottom of the window-frame, those at the top provided at one side with pulleys and rods having their ends secured in said sockets, sleeves slidable on said guides and provided at one side with sockets, a shade-roller carried by said sockets, a windlass mounted at the top of the window-frame and provided with three annular peripheral grooves, said windlass having on one of its heads pivoted dogs adapted normally to engage sockets in the windlass-spindle, flexible devices each connected at one end with one of the sockets and at the other end with one of the end grooves of the windlass, a flexible device connected at one end with the middle groove of the windlass, and guards whereby such flexible devices are prevented from displacement upon the windlass.

5. Improved means of the class described, comprising brackets mounted on each side of the window-frame at the top and bottom and provided with sockets, the upper brackets being also provided with pulleys; guide-rods secured in the opposing sockets; sleeves slidable on the rods and provided at one side with sockets; a shade-roller having its ends secured in the sliding sockets; a windlass mounted at the top of the window and provided with three annular peripheral grooves, said windlass having on one of its heads pivoted dogs adapted normally to engage sockets in the windlass-spindle; flexible devices connected with the sliding sockets and passing over pulleys and the grooves in the windlass, a flexible device adapted to wind around the middle groove of the windlass, and guards slightly spaced from the pulleys and windlass and the middle one provided with an elongated slot to prevent displacement of the flexible devices.

710,080. MACHINERY FOR CUTTING AND FOLDING PAPER OR OTHER FABRICS. RALPH C. SETHOUR, South Orange, N. J., assignor to C. B. Cottrell & Sons Company, New York, N. Y., and Stonington, Conn., a Corporation of New Jersey. Filed May 31, 1902. Serial No. 109,606. (No model.)



Claim.—1. The combination with means for continuously feeding a web, of two rotary cutter-carriers geared together and each having upon it a plurality of cutters arranged at unequal distances apart for cutting sheets of different length from the web during each revolution of said cutters, substantially as herein described.

2. The combination with means for continuously feeding a web, of two rotary cutter-carriers and shafts therefor geared together and each having two cutting-blades the spaces between the edges of which on a circle concentric with the axes of their shafts are unequal in opposite directions for cutting sheets of different length from the web during each revolution of said cutters, substantially as herein described.

3. The combination of two rotary cutter-carriers and shafts therefor geared together and each having two cutting-blades the spaces between the edges of which on a circle concentric with the axes of their shafts are two hundred and forty degrees in one direction and one hundred and twenty degrees in the opposite direction for cutting at each revolution two sheets one of which is double the length of the other, substantially as herein described.

4. The combination with two rotary cutter-carriers each having two cutter-blades whose edges are spaced at two hundred and forty degrees and one hundred and twenty degrees apart as described, of two rotary cylinders of which one is of a circumference three times that of the other, a folding-blade carried by the larger of said cylinders, folding-grippers carried by the smaller of said cylinders and coöperating with said folding-blade and means for producing the rotation of said cylinders and cutter-carriers with a surface velocity of the cylinders corresponding with that of the cutter edges, substantially as herein set forth.

5. The combination with two folding-cylinders one of which is provided with a folding-blade and the other of which is provided with folding-grippers coöperating with said blade, of impaling-pins carried by the first-mentioned cylinder and coöperating with said grippers to take folded sheets therefrom, substantially as herein described.

6. The combination of two folding-cylinders, a folding-blade carried by one of said cylinders, a rock-shaft provided with gripper members pivoted on the other of said cylinders and impaling-pins on the first-specified cylinder, one of said gripper members having in it holes for the reception of the ends of said impaling-pins, substantially as herein described.

7. The combination of two rotary folding-cylinders one of which is provided with a folding-blade and the other of which is provided with grippers consisting of one member directly pivoted to the cylinder and the other member pivoted to said directly-pivoted member, and a spring between the two members for holding them in a closed or nearly-closed condition at the time of entry of the folding-blade between them in the rotation of the two cylinders, substantially as herein described.

8. The combination of two rotary folding-cylinders one of which is provided with a folding-blade and the other of which is provided with grippers consisting of one member directly pivoted to the cylinder and the other member pivoted to said directly-pivoted member, a spring between the two members for closing them, and a stop between the two members against which the spring holds them nearly closed at the time of the entry of the folding-blade between them in the rotation of the two cylinders, substantially as herein described.

9. The combination of two rotary cutter-carriers and cutting-blades thereon spaced to cut a longer and a shorter sheet at each revolution, two rotary cylinders one of which is provided with a folding-blade and the other with folding-grippers coöperating with said blade to fold a longer sheet presented between said cylinders, pins carried by the first-specified cylinder and coöperating with said grippers first to impale together an unfolded shorter sheet presented between said cylinders and the so-folded longer sheet and afterward to take both sheets together from between the cylinders, substantially as herein described.

10. In a folding-machine, the combination with a rotary cylinder, a rock-shaft journaled on said cylinder and grippers carried by said rock-shaft, of a cam located at one end of said cylinder and engaging with said rock-shaft for turning the same to bring the grippers to a position radial or tangential to said cylinder, a cam located at the other end of said cylinder and engaging with said rock-shaft to hold the grippers in the tangential position, connections between said cams and means for moving them together to place either one into engagement and the other one out of engagement with the rock-shaft, substantially as herein described.

11. In a folding-machine, the combination of a horizontal rotary cylinder, a rock-shaft journaled on said cylinder and grippers carried by said rock-shaft, a non-rotative cam located at one end of said cylinder for engaging with said rock-shaft for turning the same to bring the grippers radial or tangential to said cylinder, a non-rotative cam located at the other end of said cylinder and engaging with said rock-shaft to hold the grippers in the tangential position, the said cams being movable toward and from the ends of the cylinder, connections between said cams whereby when either one is moved toward the cylinder into engagement with said rock-shaft the other is moved from the cylinder and out of engagement with the rock-shaft, and an upright shaft on which is a cam for moving the before-mentioned cams together into and out of engagement respectively, substantially as herein described.

12. In a folding-machine, the combination of a rotary cylinder, a rock-shaft journaled on said cylinder and gripper members carried by said rock-shaft, a second rock-shaft journaled into the first one and forming part of one member of said grippers, a non-rotative cam located at one end of said cylinder and movable toward and from the cylinder and into and out of engagement with the first-mentioned rock-shaft for holding the grippers in and releasing them from a position tangential to the cylinder, and a projection on said cam for operation on said second rock-shaft to open the grippers while in their tangential position, substantially as herein described.

710,081. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES P. STEINMETZ and WILLIAM L. R. EMMET, Schenectady, N. Y., assignors to the General Electric Company, a Corporation of New York. Filed Dec. 21, 1899. Serial No. 741,101. (No model.)

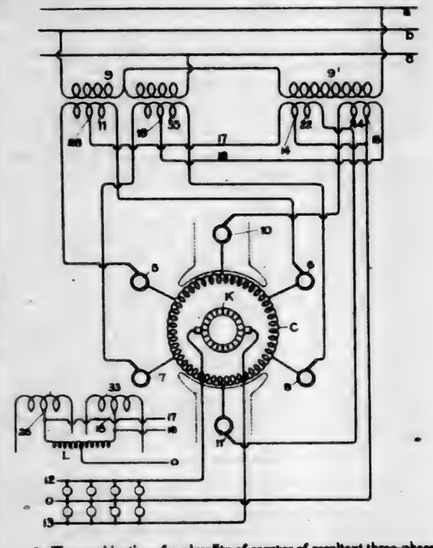
Claim.—1. The combination of a rotary converter having an odd number of phases, and means for supplying said converter with current derived from quarter-phase electromotive forces.

2. The combination of a rotary converter having an odd number of phases, and means for supplying said converter with current derived from quarter-phase magnetomotive forces.

3. The combination of a converter having a number of phases equal in number to a multiple of three, and means for operating said converter with current derived from quarter-phase electromotive forces.

4. The combination of four transformer-windings, means for generating electromotive forces of the same phase in two of the windings, means for generating in the other windings electromotive forces bearing a quarter-phase relation to the electromotive forces in the first two windings, and a six-phase alternating-current dynamo-electric machine supplied with current from said windings.

5. The combination of a plurality of sources of resultant three-phase electromotive forces, each source consisting of two windings having the middle point of one connected to a terminal of the other, a dynamo-electric machine, and connections between each source and points in a winding on said machine.



6. The combination of a plurality of sources of resultant three-phase electromotive forces, each source consisting of two windings having the middle point of one connected to a terminal of the other, a dynamo-electric machine, and connections between each source and points in a winding on said machine displaced by one-third of the polar pitch.

7. The combination of a dynamo-electric machine having a number of phases represented by a multiple of three, and a plurality of sources of resultant three-phase electromotive forces, each of said sources consisting of two windings the terminal of one of which is connected into an intermediate point in the length of the other.

8. The combination of a rotary converter having a number of phases represented by a multiple of three, and a plurality of sources of resultant three-phase electromotive forces, each of said sources consisting of two windings the terminal of one of which is joined to the middle point of the other.

9. The combination of a rotary converter having a number of phases represented by a multiple of three, a plurality of sources of resultant three-phase electromotive forces, each of said sources consisting of two windings, the terminal of one of which is joined to the middle point of the other, and a neutral conductor connected to the junctions of the windings of said sources.

10. A multiphase rotary converter, a multiphase alternating-current system, and a neutral conductor leading from a point of neutral potential in one phase only of said alternating-current system.

11. The combination of a dynamo-electric machine, provided with taps leading from equally-spaced points in a winding thereon, a plurality of coils carrying currents of different phases, connections between coils of the same phase and points in said winding separated by one-half the polar pitch, and connections between other coils and points in said winding displaced by less than half the polar pitch.

12. A multiphase dynamo-electric machine, a multiphase alternating-current system, and a neutral conductor leading from points of neutral potential in a plurality of coils in one phase only of said alternating-current system.

13. The combination of a six-phase rotary converter, means for generating a set of quarter-phase electromotive forces, means for impressing said electromotive forces upon points in the winding of said converter in such manner as to cause six-phase currents to flow, and a conductor leading from a point of neutral potential in the system of conductors generating the quarter-phase electromotive forces, and coöperating with direct-current mains leading from the commutator of said converter.

14. The combination of a multiphase rotary converter having a number of phases represented by a multiple of three, means for generating quarter-phase electromotive forces, and means for impressing said electro-

motive forces upon said converter in such a manner as to cause the currents acting therein to have a phase relation different from that of said electromotive forces.

15. The combination of a multiphase rotary converter having a number of phases represented by a multiple of three, means for generating quarter-phase electromotive forces, means for impressing said electromotive forces upon said converter in such a manner as to cause the currents acting therein to have a phase relation different from that of said electromotive forces, and a conductor leading from a point of neutral potential on the generating system for the quarter-phase electromotive forces and cooperating with the direct-current mains of said converter.

16. The combination of an armature provided with a commutator, and T-connected windings connected to the armature through collector-rings.

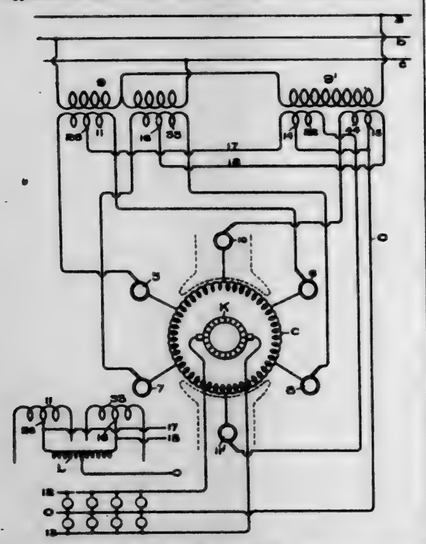
17. The combination of an armature provided with a commutator, two windings having a terminal of one connected to an intermediate point in the length of the other, and connections between the armature and the free terminals of said windings.

18. The combination of an armature provided with a commutator, two windings having a terminal of one connected to an intermediate point in the length of the other, connections between the armature and the free terminals of said windings, direct-current mains leading from the commutator, and a neutral conductor connected to an intermediate point in the length of one of said windings and cooperating with said mains.

19. The combination of an armature, a commutator, T-connected windings connected to the armature, direct-current mains extending from the commutator, and a neutral conductor connected to one of said windings.

20. The combination of an armature, a commutator, T-connected windings connected to the armature, direct-current mains extending from the commutator, and a neutral conductor connected to an intermediate point in the length of one of said windings.

710,082. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES P. STEINMETZ and WILLIAM L. R. EMMET, Schenectady, N.Y., assignors to General Electric Company, a Corporation of New York. Original application filed Dec. 21, 1899, Serial No. 741,101. Divided and this application filed Feb. 13, 1902. Serial No. 93,532. (No model.)

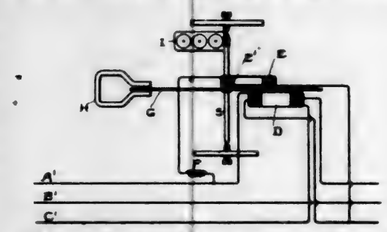


Claim.—1. The method which consists in deriving quarter-phase electromotive forces by the action of three-phase currents, combining said electromotive forces in proper proportions to produce resultant six-phase electromotive forces, and deriving direct current from said six-phase electromotive forces.

2. The method which consists in setting up quarter-phase electromotive forces, combining said electromotive forces in such relations and in such proportions as to produce six-phase electromotive forces and deriving direct current from said six-phase electromotive forces.

3. The method which consists in setting up quarter-phase electromotive forces, combining said electromotive forces in such relations and in such proportions as to produce a system of polyphase electromotive forces having a number of phases greater than two and deriving direct current from said system of electromotive forces.

710,088. ELECTRIC METER. GEORGES STEIN, Charlottenburg, Germany, assignor to the General Electric Company, a Corporation of New York. Filed Dec. 11, 1900. Serial No. 39,594. (No model.)

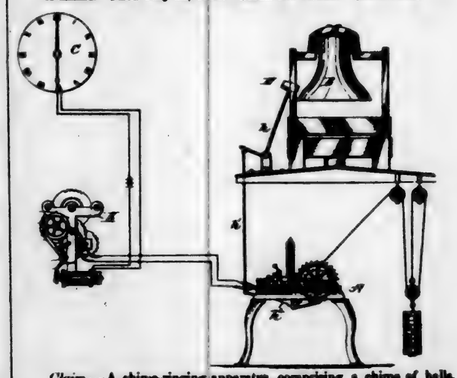


Claim.—1. In an induction-meter for three-phase circuits, a main-current winding consisting of a single coil comprising a plurality of sections suitably connected to the three-phase mains, a shunt-winding connected across points, the potential between which is in phase with the resultant of the currents in the sections of the main-current winding on non-inductive load, and means for causing the magnetic field due to the shunt-winding to be displaced by substantially ninety degrees from the electromotive force impressed upon the shunt-circuit.

2. In an induction-meter for three-phase circuits, a main-current winding consisting of a single coil comprising a plurality of sections each connected in circuit with one of the three-phase mains, a shunt-winding connected between two of the mains, and means for causing the field due to the shunt-winding to be displaced by substantially ninety degrees from the electromotive force impressed upon the shunt-circuit.

3. In an induction-meter for three-phase circuits, a main-current winding consisting of a single coil comprising two sections each connected in circuit with one of the three-phase mains, a shunt-winding connected between the mains in which the series sections are included, and means for causing the field due to the shunt-winding to be displaced by substantially ninety degrees from the electromotive force impressed on the shunt-circuit.

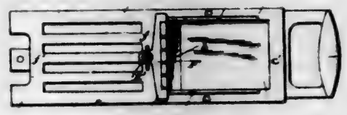
710,084. CLOCK-CHIME. GEORGE M. STEVENS, Cambridge, Mass., assignor to George M. Stevens Co., Kittery, Me., a Corporation of Maine. Filed July 23, 1901. Serial No. 69,223. (No model.)



Claim.—A chime-ringing apparatus, comprising a chime of bells, each having a hammer adapted to strike its bell; mechanisms for operating said hammers; electrical circuits including an electrical generator and make-and-break disks adapted to cause said mechanisms to operate; a series of make-and-break disks having contact-points arranged to cause the said mechanisms to strike the bells in musical order; a motor-train for actuating the said make-and-break disks; a mechanism for starting said motor-train; a clock-movement for timing the operation of said starting mechanism, all adapted to operate together, substantially as and for the purpose set forth.

710,085. POTATO SLICER AND CUTTER. LAWRENCE L. STEVENS, Los Angeles, Cal. Filed Jan. 24, 1902. Serial No. 91,129. (No model.)

Claim.—1. In slicing-machines, the recessed stationary plate having grooves upon the under face thereof throughout the entire length of said plate, the cutter-handle plate carrying the cutter-blade and the reversible stop secured to said stationary plate.



2. The recessed stationary plate provided with longitudinal grooves, the cutter-handle plate adapted to slide in said grooves, and carrying the cross-cutter blade, the reversible stop secured to the stationary plate, the cutter-handle plate having one or more series of ways and an adjustable well-bottom plate carrying cutter-knives adapted to slide in said ways.

3. The recessed bed-plate having longitudinal grooves upon the under face thereof, the reversible stop removably secured to said bed-plate, the cutter-handle plate carrying the cross-cutter blade, the cutter-handle plate provided with one or more series of longitudinal ways below the upper face thereof, a well-bottom plate carrying a series of adjustable knives and adapted to slide longitudinally in said series of ways in the cutter-handle plate.

4. In slicing and cutting machines, the recessed stationary bed-plate provided with longitudinal grooves upon the under face thereof and extending substantially the entire length of said plate, the removable and reversible stop secured to said bed-plate, the cutter-handle plate carrying the cross-cutter blade and having one or more series of longitudinal ways below the upper face thereof, a well-bottom plate provided with serrations or slots in the front edge thereof, said well-bottom plate carrying a series of adjustable cutter-knives adapted to operate in said slots.

5. The potato slicing and cutting machine comprising the recessed stationary bed-plate having the clamping-bracket at the rear end thereof and cast integral therewith, said plate provided with grooves upon the under side thereof and extending substantially the entire length of said plate, the reversible stop removably secured to said plate, the cutter-handle plate carrying the cutter-blade adapted to slide in said grooves, the said cutter-handle plate provided with one or more series of horizontal ways below the upper face thereof, a well-bottom plate having open-ended slots or serrations at the front edge thereof, the said well-bottom plate carrying one or more series of cutter-knives adjustably secured thereto and adapted to slide longitudinally in said horizontal ways.

710,086. CABINET FOR BOOKCASES, LETTER-FILES, &c. FELIX TRAMBLAY, Chicago, Ill. Filed May 11, 1901. Serial No. 59,729. (No model.)

Claim.—1. An expansible knockdown cabinet structure comprising a plurality of compartments each constructed of separable bottom, top and end members, provided in their margins with grooves, connecting-plates fitting in said grooves and detachably connecting said parts, the outer end and top walls of certain of the compartments constituting the single partition-wall between said compartment and other compartments formed by the addition to said first compartment of members which are substantial duplicates in size of the members constituting said first compartment.

2. An expansible and knockdown cabinet structure comprising two or more compartments, each consisting of separable bottom, top and end and back members, connecting-plates detachably connecting the margins of the bottom, top and end members, the said end members being provided with rearwardly-opening L-shaped slots and the back member being provided with lugs adapted to enter said slots when the back member is in place, the outer end and top walls of certain of the compartments constituting the single partition-wall between said compartment and other compartments formed by the addition to said first compartment of members which are substantial duplicates in size of the members constituting said first compartment.

3. An expansible and knockdown cabinet structure comprising two or more compartments, each constructed of separable bottom, top and end and back members, connecting-plates detachably connecting the margins of the bottom, top and end members, the said end members being provided with rearwardly-opening L-shaped slots and the back member being provided with lugs adapted to enter said slots when the back member is in place, the outer end and top walls of certain of the compartments constituting the single partition-wall between said compartment and other compartments formed by the addition to said first compartment of members which are substantial duplicates in size of the members constituting said first compartment.

4. A cabinet structure comprising a plurality of compartments, with two or more compartments located side by side, each compartment being constructed of vertical and horizontal members which are duplicates of the members composing the other compartment or compartments, and each two adjacent, laterally-separate compartments having a common end member constituting the partition between said compartments, and provided in its upper and lower margins with grooves, and flanged connecting-plates fitting in grooves in the margins of the horizontal members, the flanges of the plates of two adjacent horizontal members of adjoining compartments engaging with the same groove of the common partition member thereof.

5. The combination, with a horizontal shelf member provided in one margin with a groove, and two end members adapted for attachment to the grooved margin of the shelf member, said end members being provided in their margins adjacent to the shelf member with grooves, of a locking-plate fitting in the groove of said shelf member and provided with oppositely-directed flanges which enter the grooves of said end members, said plate extending laterally to, but not beyond, the grooves of the end members, and the flanges at the opposite sides of the plate extending only a part of the way across the same, whereby the like flanges of a second laterally-extending locking-plate may enter the grooves of said end members in the same plane with the flanges of the first-mentioned locking-plate.

6. In a cabinet structure, the combination with two shelf members disposed end to end and provided at their adjacent margins with grooves, and two end members intersecting said shelf members and having grooves in their adjacent margins, of locking-plates fitting in the grooves of said shelf members and provided on their adjacent margins each with oppositely-extending flanges which enter the grooves of said end members.

7. In a cabinet structure, the combination with two shelf members disposed end to end and provided in their adjacent margins with grooves, and two end members intersecting said shelf members and having grooves in their adjacent margins, of connecting-plates fitting in the grooves of said shelf members and provided on their adjacent margins each with oppositely-directed prongs which enter the grooves of said end members, the prongs of one of said plates being located out of line with the prongs of the adjacent plate.

8. In a cabinet structure, the combination with shelf members disposed end to end and provided in their adjacent margins with grooves, and two end members intersecting said shelf members and having grooves in their adjacent margins, of connecting-plates fitting in the grooves of said shelf members and provided on their adjacent margins each with oppositely-directed prongs which enter the grooves of said end members, the prongs of one of said plates being located out of line with the prongs of the adjacent plate, certain of the prongs of said plates being provided with auxiliary prongs which are bent oppositely to the direction of the prongs from which they are formed.

9. In a cabinet structure, the combination with a shelf member having a groove in one of its margins, and end members having grooves in their adjacent margins, said end members intersecting the shelf member, of a connecting-plate made of sheet metal and comprising a flat web which enters the groove in said shelf member and having its margins cut and folded in opposite directions to form prongs, the prong at one side of said web being located out of line with the prong at the other side thereof, said prongs entering the grooves in said end members, and the plates extending but half the distance across the margins of said end members.

10. A sheet-metal connecting-plate comprising a flat web provided at its margin with oppositely-directed prongs, the prongs at one side of the plate being located out of line with the prongs at the other side thereof, the prongs at the end of said plate being cut and folded to form auxiliary prongs which are bent oppositely to the direction of the prongs from which they are formed.

11. A cabinet structure consisting of members provided at their margins with grooves and which are detachably interlocked at their margins, the interlocking devices consisting of metal plates, each of which enters

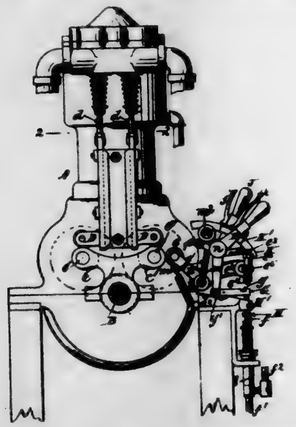
the groove in the margin of one member and is provided at its free margin with oppositely-directed prongs which enter the grooves in the two members which intersect the first-mentioned member, the two prongs at the ends of the plates being provided with auxiliary prongs which are bent oppositely to the direction of the prongs from which they are formed.

12. A cabinet structure comprising a plurality of members which are provided in their margins with grooves and are detachably interlocked at their margins, the interlocking devices consisting of metal plates, each of which enters the groove in the margin of a horizontal member and is provided at its free margin with upwardly and downwardly extended prongs which are adapted to enter the grooves in the upper and lower margins of intersecting vertical members, the connecting-plate of each horizontal member extending but half the distance across the margins of the intersecting vertical members.

13. A cabinet structure comprising a plurality of compartments each consisting of a plurality of horizontal and vertical members, connecting-plates for detachably interlocking said horizontal and vertical members at their margins, said plates being separable from the vertical members by movement thereof in the direction of the planes of the vertical members, and said vertical members being provided on their inner faces adjacent to their rear margins with L-shaped slots which open at their rear ends through the rear edges of the vertical members, back members for the several compartments, and projecting lugs on the margins of said back members adapted for engagement with said L-shaped slots.

14. A cabinet structure comprising a plurality of compartments each consisting of a plurality of horizontal and vertical members, metal plates for detachably interlocking said members at their meeting margins, said vertical members being provided at their rear margins with locking-slots, back members provided with projecting lugs adapted to engage said locking-slots, said vertical members being also provided on their adjacent or inner faces with horizontal grooves which are closed at their front ends and open at their rear ends through the rear edges of said vertical members, and shelves supported in said grooves, said back members engaging the rear edges of the shelves, when locked in position, to hold the shelves in place in said grooves.

710,087. FEED-CONTROLLING MECHANISM FOR HYDROCARBON-MOTORS. WILLIAM W. TUCK, Richmond Hill, and AUGUST WASSMANN, Astoria, N. Y. Filed Oct. 15, 1901. Serial No. 78,675. (No model.)



Claim.—1. In feed-controlling mechanism for hydrocarbon-motors, the combination of the fly-wheel W, of the engine, the tangential segment T, pivotally connected thereto, and actuated by centrifugal force, the rock-lever M, adapted for contact with said tangential segment T, at one end and having the controlling-slide G, pivotally connected at its outer end, said controlling-slide G, formed with the recess *g*, and resting upon the oil-pump piston-rod, the rock-lever E, carrying the contact-point e', at its outer extremity, adapted for contact with the cam *c'* at its inner extremity, said cam *c'*, actuated indirectly by the crank-shaft, spring K, for throwing the inner end of said rock-lever E, in contact with said cam, and a stop for limiting the upward thrust of the outer arm e^3, of said lever for the purpose set forth.

2. In feed-controlling mechanism for hydrocarbon-motors, the combination of the fly-wheel W, of the engine, the tangential segment T, pivotally connected thereto and actuated by centrifugal force, the rock-lever M, carrying the roller m', upon its upper end for contact with the tangential segment T, and pivotally connected at its other end to the controlling-slide G, a stop *a'* for limiting the motion of said lower arm *m*, of the rock-lever M, the coil-spring m^5, which tends constantly to force said lever against said stop *a'*, said controlling-slide G, resting upon the oil-pump piston-rod, and formed with the recess *g*, and with the spring *g'*, resting against a stop a^3 the rocking lever E, provided with the contact-roller *e*, at its inner end and carrying the contact-point e', at its lower end, a spring for throwing the rock-lever E, into contact with the cam *c'*, said cam *c'*, actuated indirectly by the crank-shaft for the purpose and substantially in the manner set forth.

3. In feed-controlling mechanism for hydrocarbon-motors, the combination of the fly-wheel W, of the engine, the tangential segment T, pivotally connected thereto and actuated by centrifugal force, the rock-lever M, carrying the contact-roller m^3, at one end and the controlling-slide G, at the other, said controlling-slide G, resting upon the oil-pump piston rod, and formed with the recess *g*, the rock-lever E, fulcrumed upon the stud *i*, upon the eccentric I, and carrying the contact-roller *e*, at its inner end and the contact-point e', at its outer end, means for thrusting said rock-lever E, in contact with the cam *c'*, said cam *c'*, actuated indirectly by the crank-shaft, the lever J, rigidly connected to the eccentric I, and provided with the hand-pawl *j'*, and the segmental rack K, the whole arranged and operating substantially in the manner and for the purpose set forth.

4. In feed mechanism for controlling hydrocarbon-motors, the combination of the fly-wheel W, of the engine, the tangential segment T, pivotally connected thereto and actuated by centrifugal force, the rock-lever M, carrying the roller m^3, for contact with said segment T, at one extremity and the controlling-slide G, at the other extremity, said controlling-slide resting upon the oil-pump piston-rod, and formed with the recess *g*, of the rock-lever E, provided with the contact-roller *e*, at its inner end for engagement with the cam *c'*, actuated indirectly by the crank-shaft, and the rock-lever P, carrying the contact-roller *p'*, at its inner end for engagement with the roller m^3, upon the rock-lever M, for the purpose set forth.

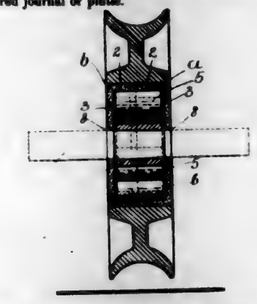
5. In feed-controlling mechanism for hydrocarbon-motors, the combination of the fly-wheel W, of the engine, the tangential segment T, pivotally connected thereto, and actuated by centrifugal force, the rock-lever M, carrying the roller m^3, for contact with said segment T, at one extremity and the controlling-slide G, at the other extremity, said controlling-slide G, resting upon the oil-pump piston-rod and formed with the recess *g*, the rock-lever E, provided with the contact-roller *e*, at its inner end for engagement with the cam *c'*, actuated indirectly by the crank-shaft, the rock-lever P, carrying the contact-roller *p'*, at its inner end for engagement with the roller m^3, upon the rock-lever M, a hand-pawl p^3, on the lever J, and the segmental rack K', the whole arranged and operating substantially in the manner and for the purpose set forth.

6. In feed-controlling mechanism for hydrocarbon-motors, the combination of the fly-wheel W, of the engine, the tangential segment T, pivotally connected thereto and actuated by centrifugal force, the rock-lever M, carrying the roller m^3, for contact with the said segment T, at one extremity, and the controlling-slide G, at the other extremity, said controlling-slide G, resting upon the oil-pump piston-rod, and formed with the recess *g*, the rock-lever E, provided with the contact-roller *e*, at its inner end for engagement with the cam *c'*, and carrying the contact-point e', on its other extremity, said cam *c'*, actuated indirectly by the crank-shaft, the rock-lever P, carrying the contact-roller *p'*, at its inner end and provided with the hand-pawl p^3, the segmental rack K', the eccentric I, having the stud *i*, upon which the rock-lever E, is fulcrumed, and connected rigidly to a lever J, said lever J, provided with the hand-pawl *j'*, and the segmental rack K, the whole arranged and operating substantially in the manner and for the purpose described.

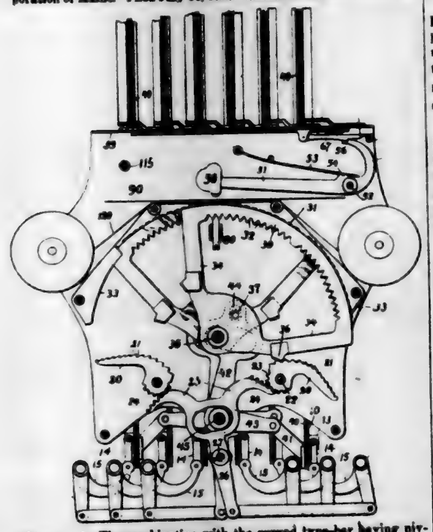
710,088. ROLLER-BUSHING FOR SHEAVES. WILLARD F. WELLMAN, Belmont, Me. Filed Feb. 3, 1902. Serial No. 92,294. (No model.)

Claim.—1. A roller-bushing comprising two separable bushing members adapted to enter a socket in a sheave or pulley, each member having a cylindrical recess at its inner side the margin of which forms a raceway and an annular flange at its outer end forming an end wall of the recess, a series of bearing-rolls in contact with the cylindrical margin of the chamber, a series of separating-rolls in contact with the said cylindrical margin and with the bearing-rolls, the said rolls being confined against endwise displacement by said end walls, and a sleeve in contact with the inner surfaces of the bearing-rolls and preventing inward movement thereof, toward the axis of the bushing, said sleeve being confined against endwise displacement by said end walls and formed internally to receive the journal or pintle on which the sheave rotates.

2. A roller-bushing comprising two separable bushing members adapted to enter a socket in a sheave or pulley, each member having a cylindrical recess at its inner side the margin of which forms a raceway and an annular flange at its outer end forming an end wall of the recess, a series of bearing-rolls in contact with the cylindrical margin of the chamber, a series of separating-rolls in contact with the said cylindrical margin and with the bearing-rolls, the said rolls being confined against endwise displacement by said end walls, and a sleeve in contact with the inner surfaces of the bearing-rolls and preventing inward movement thereof, toward the axis of the bushing, said sleeve being confined against endwise displacement by said end walls and internally tapered to receive and engage a tapered journal or pintle.



710,089. TYPE-WRITING MACHINE. GEORGE H. WILLIAMS, Boston, Mass., assignor to Stenotype Company, Boston, Mass., a Corporation of Maine. Filed July 11, 1900. Serial No. 23,242. (No model.)



Claim.—1. The combination with the curved type-bar having pivotal support connected thereto by radial arms and the rigidly-projecting pin; the lever having the slot engaging said pin, and the arm; the longitudinal bar connected with said arm, and having the series of inclined cam-slots; and the row of depressible keys located over said bar and having the rolls adapted to engage said cam-slots, substantially as set forth.

2. The combination with the curved oscillatory type-bar, having the series of type characters upon its peripheral face; and the row of keys adapted when any one thereof is depressed to shift said type-bar; of the longitudinally-movable bar located beneath said keys and having the inclined cam-slots adapted to be engaged by said keys; and a variously-stepped stop adapted to be shifted into proper relation with said type-bar when any one of said keys is depressed, substantially as set forth.

3. The combination with the curved oscillatory type-bar having the type upon its periphery and the impact-lug; and the row of keys adapted when depressed singly to shift said type-bar; of the pivoted stop having the graded impact-notches and the teeth; the lever having the rack-arm meshing with said teeth, and means whereby the depression of any one of said keys is adapted to move said lever and present the proper notch to the impact of said impact-lug, substantially as set forth.

4. The combination with the curved oscillatory type-bar having the type upon its periphery, and the impact-lug; of the row of keys adapted when depressed singly to shift said type-bar; of the pivoted stop having the graded impact-notches and the teeth; the lever having the rack-arm meshing with said teeth; the longitudinally-movable bar located beneath said row of keys and having the inclined cam-slots adapted to be engaged by said keys, and intermediate connections between said bar and lever for enabling the reciprocation of said bar to actuate said lever, substantially as set forth.

5. The combination with the curved oscillatory type-bar having the type upon its periphery and normally presenting its median point to the printing device; of the row of keys adapted when depressed singly to shift said type-bar to one side or the other of said median point; the longitudinally-movable bar located beneath said keys and having the inclined cam-slots adapted to be engaged by said keys; the lever having the two rack-arms; intermediate connections between said lever and bar and enabling the reciprocation of the latter to operate said lever; and the two pivoted stops having the graded impact-notches and the teeth, substantially as set forth.

6. In a type-writing machine, the pivoted hammer having the flat surface centrally located with respect to the pivotal point; the spring pressing upon said surface; and means for raising and releasing said hammer, substantially as set forth.

7. In a type-writing machine, the combination of the pivoted hammer; the spring controlling the same; the longitudinally-reciprocative detent having the inclined shoulder, and the detent-shoulder engaging the tail rigidly projecting from said hammer; and the post; whereby the movement of said detent first acts to raise the hammer, and then the engagement of said inclined shoulder with said post serves to release said hammer from the detent, substantially as set forth.

8. In a type-writing machine, the combination of the row of depressible keys; the bar located beneath the same and adapted to be depressed when any one of said keys is moved; the bell-crank lever connected with said bar; the slotted plate pivotally supporting said lever; the pivoted arm; the rod joined to said lever and arm; the detent carried by said rod; and the hammer adapted to be actuated by said detent, substantially as set forth.

9. In a type-writing machine, the combination of the row of depressible keys; the bar located beneath the same and adapted to be depressed when any one of said keys is moved; the pivoted bell-crank levers supporting said bar upon their substantially horizontal arms; the slender rod pivoted to the upright arms of said levers, and elastic means for keeping said bar in a normally elevated position, substantially as set forth.

10. In a type-writing machine, the combination with the apertured case, of the key having the stem; the spiral spring surrounding said stem and supporting the key; and the sleeve inclosing said spring and movable in said aperture, substantially as set forth.

11. In a type-writing machine, the combination of the keys having the stem and the slotted shoulder; the antifriction devices in said slot; the two bars located side by side with their upper edges in said slot and having the inclined cam-slots entered by said antifriction devices; and the depressible bar engaged by said shoulder, substantially as set forth.

12. In a type-writing machine, the combination of the curved oscillatory type-bar having the type upon its periphery and the V-notches opposite thereto; the row of depressible keys; the bar adapted to be depressed by the movement of any one of said keys; the lock fitted to said notches in said type-bar; and means whereby the depression of said bar acts to throw said lock into engagement with one of said notches, substantially as set forth.

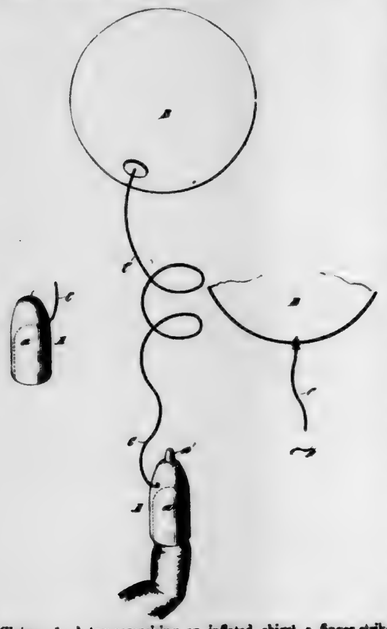
13. In a type-writing machine, the combination with the printing devices, of the reel for winding the paper tape; the drum connected with said reel; the tensioned cord wound on said drum; the drag-roll; the pressure-roll; and means for permitting the intermittent movement of said drag-roll, substantially as set forth.

14. In a type-writing machine, the combination with the type-bar and the row of keys controlling the same, of the depressible bar actuated by any one of said keys; the post depending from said bar; the rod in line with said post, and means for elastically raising it; the pawl pivoted to the lower end of said rod; the face-plate having the pins engaged by said pawl; the worm turning with said face-plate; the worm-gear meshing with said worm; the roll turning with said gear; and the pressure-roll elastically pressed against said roll, substantially as set forth.

15. In a type-writing machine, a case formed in two separable sections, the upper or cover portion of which is provided with keys upon its exterior reaching through to its interior; type-writing devices secured within said cover portion and adapted to be actuated by said keys; and paper-feeding devices located in the lower section of said case, the type-writing devices being constructed to receive the paper when the said sec-

tions are folded together or closed, and to release the paper when opened, substantially as set forth.

710,090. TOY. DAVID J. WILLIS, Washington, D. C., assignor to Herrell Repoy Manufacturing Company, Washington, D. C. Filed Aug. 7, 1902. Serial No. 118,835. (No model.)



Claim.—1. A toy comprising an inflated object, a finger-striker, said striker preventing contact of the finger and object, and an elastic connection between the object and striker.

2. A toy comprising an inflated object, a finger-striker having a striking-surface, said striker preventing contact of the finger and object, and a permanent connection between the object and striker.

3. A toy comprising an inflated object, a striker having a finger-socket and a striking-surface, said striker preventing contact of the finger and object, and a permanent connection between the object and striker.

4. A toy comprising an inflated object, a striker consisting of a block having one end semispherical in form and its opposite end provided with a finger-socket, said striker preventing contact of the finger and object, and a permanent connection between the object and striker.

5. A toy comprising an inflated object, a striker having at one end a finger-socket and its other end provided with a semispherical surface, the latter end carrying a projecting striking-surface, and a permanent elastic cord connecting the striker and object.

710,091. APPARATUS FOR DISCHARGING INFLAMMABLE OR OTHER LIQUIDS FROM STORAGE-TANKS AT THE OUTBREAK OF FIRE. CHARLES ALLENOU, Serres, France. Filed Apr. 3, 1902. Serial No. 101,989. (No model.)

Claim.—1. The combination with a tank for the storage of inflammable liquid, and a discharge-pipe leading from the bottom thereof, of a diaphragm arranged across and normally closing said discharge-pipe, a puncture device supported above said diaphragm by a fusible joint, and means connected with said puncture device for automatically closing the discharge-pipe after the liquid has been discharged from the tank.

2. The combination with a tank for the storage of inflammable liquid, and a discharge-pipe leading from the bottom thereof, of a frangible disk or plate arranged across and normally closing the discharge-pipe, a rod supported by a fusible joint and adapted when released to break said disk or plate and establish communication between the tank and discharge-pipe, and means connected with said rod for closing the discharge-pipe after the liquid has been discharged from the tank.

3. The combination with a tank for the storage of inflammable liquid, and a discharge-pipe leading from the bottom thereof, of a frangible disk or plate arranged across the inner end of the discharge-pipe, a rod supported above said disk or plate by a fusible joint and adapted when released to break said disk or plate, a stop or plug mounted on said rod and adapted to close the discharge-pipe, and means controlling the movement of said rod, whereby when released it will first break the frangible disk or plate and after the liquid from the tank has been discharged will be again operated to bring the plug thereon into position to close the discharge-pipe.

4. The combination of a tank for the storage of inflammable liquid having an aperture in its top, a discharge-pipe leading from the bottom of the tank, frangible disks or plates normally closing said discharge-pipe and the aperture in the top of the tank, means for breaking said disks or plates normally held in active position by suitable fusible material, a water-supply duct, and a valve in said duct connected with and adapted to be opened by said breaking means, said parts being so arranged that when the breaking means is released, the water-valve will be opened and the disks or plates closing the discharge-pipe and the aperture in the top of the tank successively broken.

5. The combination of a tank for the storage of inflammable liquid having an aperture in its top, a discharge-pipe leading from the bottom of the tank, frangible disks or plates normally closing the discharge-pipe and said aperture in the top of the tank, a rod supported by the fusible joint above the disk closing the discharge-pipe, means connected with said rod for breaking the disk closing the aperture in the top of the tank, a water-supply duct having a valve connected with said rod, and means connected to said rod for closing the discharge-pipe, said parts being so arranged that when the rod is released the disk closing the discharge-pipe will be broken and the valve in the water-supply duct opened and thereafter the discharge-pipe will be closed and the disk closing the aperture in the tank-top broken to admit water to the interior of the tank.

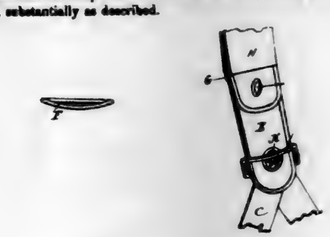
6. The combination with a tank for the storage of inflammable liquid, a discharge-pipe leading therefrom, and a water-pipe arranged above the tank, of means for normally closing said pipes, automatic means for opening said pipes, a fusible joint normally holding said means in inactive position, and supplemental means for closing the discharge-pipe and admitting water to the interior of the tank.

7. The combination of a tank for the storage of inflammable liquid, having a plurality of apertures in its top, frangible disks closing one or more of said apertures, outwardly-swinging valves closing the other of said apertures, a discharge-pipe leading from the bottom of the tank, a water-pipe adapted to deliver water into the tank, and means, normally held in inactive position by a fusible joint, for actuating a valve in the water-pipe and successively opening the discharge-pipe and breaking the frangible disk or disks at the top of the tank.

8. The combination of a tank for the storage of inflammable liquid, a discharge-pipe leading from the bottom of the tank and consisting of three concentrically-arranged members the inner member being completely open at its lower end, and communicating at its upper end with the tank, the intermediate member having outlets in its bottom and side walls, and the outer member having air-inlets in its side walls above the plane of the outlets in the intermediate member, frangible disks or plates arranged across the upper end of the inner member and the lower end of the intermediate member of said pipe, a rod supported by a fusible joint above the disk or plate at the upper end of the inner member of the discharge-pipe, a plug or stopper mounted on said rod above its lower end, and adapted to fit snugly within the lower end of the inner member of the discharge-pipe when said rod is in its lowest position, means for forcing the rod downwardly when released, to cause its lower end to successively break or pierce the disks or plates across the discharge-pipe, and means for preventing the rod from assuming its lowest position until the liquid in the tank has been discharged.

710,092. LOOP FOR SUSPENDER-ENDS. HENRY H. BARNEY, Easthampton, Mass., assignor to Nashawannuck Mfg. Co., Easthampton, Mass., a Corporation. Filed Apr. 17, 1902. Serial No. 103,311. (No model.)

Claim.—The combination with the cast-off strap of suspenders, the free end of the strap having a socket member of a ball-and-socket fastener secured thereto, of a loop consisting of a flat plate with which the suspender-end is connected and formed with a slot through which the cast-off strap extends, the upper bar of said slot being outwardly bowed, whereby the cast-off strap for the socket member may freely pass through the slot, substantially as described.



710,093. DISPLAY-TRAY. WILLIAM BRAND, Oshkosh, Wis. Filed Oct. 25, 1901. Serial No. 80,269. (No model.)

Claim.—1. A display-tray consisting of an outer frame, one of the side pieces thereof having its lower edge recessed, and a reticulated bottom piece secured to the sides of the frame below the top edges and above the bottom edges thereof, and being a sufficient distance below the top edges to form a substantial receptacle for the display of goods, and a sufficient distance above the lower edges to leave a space beneath the bottom piece.

2. A display-tray consisting of an outer frame, cleats secured to the inner sides of the side pieces thereof below the upper edges and above the lower edges of the side pieces, said cleats having their upper edges beveled downwardly, and a reticulated bottom piece secured to the cleats, the position of the cleats being such that said bottom piece is below the top edges and above the lower edges of the sides of the frame, and being a sufficient distance below the top edges to form a substantial receptacle for the display of goods, and a sufficient distance above the lower edges to leave a space beneath the bottom piece.

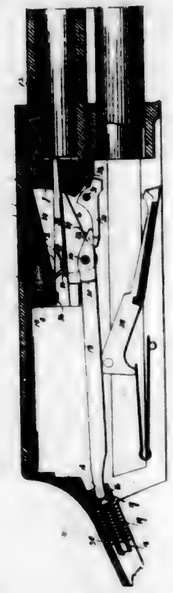
710,094. MAGAZINE-GUN. JOHN M. BROWNING, Ogden, Utah. Filed Jan. 11, 1902. Serial No. 89,265. (No model.)

Claim.—1. In a gun, the combination with a barrel having a barrel extension, of a reciprocating breech-closure formed with an upwardly-opening vertical slot, a locking-block located in the said slot and adapted at its forward end to extend upward through the slot to engage with the said barrel extension, one or more segmental ribs on which the locking-block swings instead of upon a true pivot, and means connected with the lower portion of the block for swinging it into its locking and retired positions.

2. In a gun, the combination with a barrel having a barrel extension, of a reciprocating breech-closure, a locking-block mounted therein and adapted to engage at its forward end with the upper portion of the barrel extension to lock the breech-closure in its closed position, two segmental ribs upon which the locking-block swings from its rear end instead of upon a true pivot, an operating-link connected directly with the rear end of the lower portion of the said locking-block, an operating-spring coacting with the said link, and means coacting with the lower portion of the said block for locking the same in its retired position.

3. In a gun, the combination with a barrel having a barrel extension, of a breech-closure, an extractor carried thereby, and an ejection-cam mounted in the barrel extension and acting to lift the spent shell out of engagement with the extractor.

4. In a gun, the combination with a barrel having a barrel extension, of a breech-closure, an extractor carried thereby, and an ejection-cam mounted in the said extension and formed with two inclines separated from each other sufficiently to permit the extractor to pass between them, and operating to lift the spent shell out of engagement with the extractor, and also formed with one or more ejecting-shoulders.



5. In a gun, the combination with the breech-closure thereof, of a locking-block mounted in the said breech-closure so as to swing from its rear end as upon a center located above the upper edge of the block.

710,095. SPOOL-STAND. EVELYN BUFFUM, Chicago, Ill. Filed Feb. 8, 1902. Serial No. 93,216. (No model.)

Claim.—1. In a spool-cushion, the combination of a circular holder or bracelet in two parts hinged at one side and with a catch mounted at the opposite side, two or more adjustable legs mounted upon the bracelet and one leg whose upper part forms a pin for said hinge for the purpose set forth substantially as described.

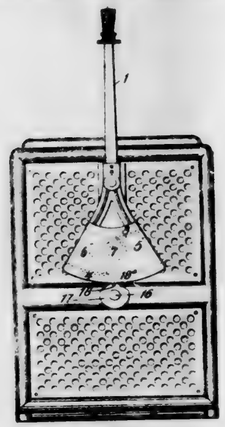
2. The combination in a spool-cushion of a circular holder or bracelet in two parts, hinged at one side, a catch mounted at the other, legs mounted upon the bracelet, means for securing said legs in position, annular openings in the bracelet with tension-springs mounted thereon, for the purpose set forth substantially as described.

3. In a spool-cushion, the combination of a circular holder or bracelet in two parts, a hinge at one side, a catch at the other, adjustable legs mounted upon the bracelet, one leg whose upper part forms a hinge-pin for said hinge, annular openings in the bracelet, springs mounted in said openings, a cushion and case mounted in the center of the circle formed by the bracelet, means for securing said cushion and case to the holder for the purpose set forth as substantially described.

4. In a spool-cushion, the combination of a circular spool-holder or bracelet in two parts, hinged at one side, a catch mounted at the opposite side, adjustable legs mounted upon the tube, means for holding said legs in place, annular openings in the holder, tension-springs mounted in said

openings, a cushion and case, in the center of the circle, composed of two parts, with a hinge on one side and a clasp on the other, means of securing said cushion and case in said circle to said bracelet, the upper part forming a cushion and the lower part a receptacle for the purpose set forth substantially as described.

710,096. ELECTRIC CONTROLLER. WILBUR A. CARRELL, West Homestead, Pa., assignor of one-half to John O. Horning, Pittsburg, Pa. Filed June 21, 1901. Serial No. 65,459. (No model.)



Claim.—1. A regulator or controller having in combination, a series of contact-plates connected to resistances, a head carrying contacts and movable along the line of the contact-plates, a circuit-changer consisting of electromagnets having contact-plates in circuit with the magnets and stationary contact-plates, and means for shifting the head and circuit-changer in succession, substantially as set forth.

2. A regulator or controller having in combination, a series of contact-plates connected to resistances, a head carrying contacts so arranged with reference to the contact-plates as to maintain a closed circuit at all times and a circuit-changer provided with a magnetic blow-out, substantially as set forth.

3. A regulator or controller having in combination a series of contact-plates connected to resistances, a shaft having toothed sectors formed on arcs of different radii, a contact-head carried by said shaft and a lever having toothed racks formed on arcs of different radii and adapted to engage said sectors alternately, whereby the angular movement of the shaft will always correspond to the angular movement of the lever, substantially as set forth.

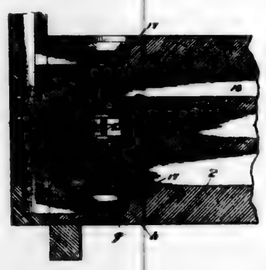
4. A regulator or controller having in combination a series of contact-plates connected to resistances, a shaft having toothed sectors formed on arcs of different radii, a contact-head carried by said shaft, a lever having toothed racks formed on arcs of different radii and adapted to engage said sectors alternately, a circuit-changer operated by the lever and a lock for the circuit-changer adapted to lock the same in either position as against further movement by the lever, substantially as set forth.

710,097. VALVE FOR PIANO-PLAYERS. JOSEPH H. CHASE, Buffalo, N. Y. Filed Oct. 2, 1901. Serial No. 77,337. (No model.)

Claim.—1. In a mechanical piano or organ player, the combination of a valve-board having a longitudinal passage, recesses on opposite sides of said board, rings secured in said recesses and providing inwardly-facing valve-seats, guide-bars extending across the said rings, a valve-stem extending through openings in said guide-bars, and a pair of disks mounted upon said stem between said valve-seats.

2. In a mechanical piano or organ player, the combination of the exhaust apparatus and power-pneumatics, the tracker-board, perforated music and music-rolls, the fingers actuated by the said power-pneumatics, a valve-board provided with a longitudinally-extending passage, said valve-board being also provided on opposite sides with recesses, flat rings seated in said recesses, guide-bars flush with the opposite surfaces of said valve-board and extending across said rings, a valve-stem arranged to reciprocate in central openings in said guide-bars, and a pair of valve-disks mounted upon said stem between said valve-seats.

3. In a mechanical piano or organ player, the combination of a valve-board made in one piece and having a longitudinally-extending channel or passage, a transversely-extending passage in said valve-board communicating with said longitudinally-extending passage, recesses or offsets formed around the opposite ends of said transverse opening or passage, flat rings seated in said recesses and providing inwardly-facing valve-seats, guide-bars extending across said rings, a valve-stem extending through openings in said guide-bars, and a plurality of valve-disks mounted upon said stem and arranged to play between said valve-seats.



4. In a mechanical piano or organ player, the combination of a valve-board formed with a longitudinally-extending passage, a transverse opening through one end of the board communicating with said longitudinal passage, annular recesses or offsets formed around the opposite ends of said transverse opening, metal rings seated in said annular recesses or offsets, guide-bars extending across the rings and flush with the outer surface of said valve-board, a valve-stem arranged to reciprocate in openings in said guide-bars, a pair of valve-disks mounted upon said stem between said rings, and a pneumatically-actuated diaphragm arranged to engage an adjustable head on the end of said valve-stem.

5. In a mechanical piano or organ player, the combination of a longitudinally and internally channeled valve-board, a transverse opening or passage extending through the end of said board and communicating with said longitudinal channel, annular recesses or offsets formed around the opposite ends of said transverse opening, flat rings seated in said recesses and providing inwardly-facing seats, guide-bars extending across the said rings and having their inner sides recessed, a valve-stem extending through central openings in the recessed portions of said guide-bars, and a pair of valve-disks mounted upon said stem between said valve-seats.

6. In a mechanical piano or organ player, the combination of the tracker-board and perforated music, the fingers actuated by power-pneumatics, the exhaust apparatus, a horizontally-disposed valve-board provided with a longitudinally-extending passage, a transverse vertical passage extending through said board and communicating with said longitudinal passage, annular recesses or offsets formed around the upper and lower ends of said transverse opening, flat metal rings seated in said recesses or offsets, guide-bars extending across the transverse opening outside the said rings, said guide-bars having their central portions reduced or cut away on their inner surfaces, a vertically-disposed valve-stem arranged for reciprocation in said reduced central portion of said guide-bars, a pair of valve-disks mounted upon said stem between said rings, and a pneumatically-actuated diaphragm arranged to engage the lower end of said valve-stem.

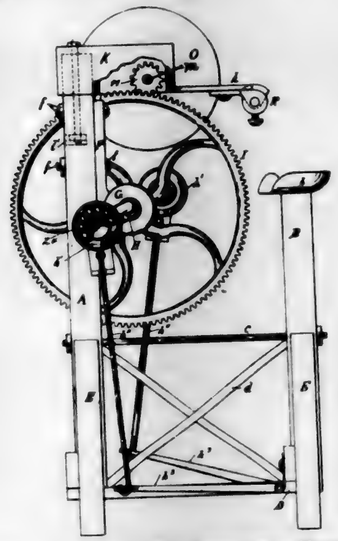
7. In a mechanical piano or organ player, the combination of a valve-board having a transverse opening or passage, annular seats or recesses formed around the ends of said transverse opening, flat metal rings seated in said annular recesses and providing inwardly-facing valve-seats, guide-bars extending across the outer surfaces of said rings, screws extending through the said guide-bars and rings and into the valve-board, a valve-stem arranged for reciprocation in openings in said guide-bars, and a pair of separated valve-disks mounted upon said stem and arranged to play between said valve-seats.

8. In a mechanical piano or organ player, the combination of a valve-board provided with oppositely-arranged recesses or seats, rings seated in said recesses or seats and providing inwardly-facing valve-seats, and an internally-arranged valve arranged to play between said valve-seats.

9. In a mechanical piano or organ player, the combination of a valve-board provided with annular recesses or seats, valve-seats seated in said annular recesses, and a pair of rigidly-connected valve-disks arranged to engage said valve-seats.

10. In a mechanical piano or organ player, the combination of the recessed valve-board, the annular valve-seats secured in the recesses in the valve-board, a valve-stem provided with valves adapted to engage said valve-seats, and centrally recessed or grooved guide-bars provided with openings adapted to receive said stem.

710,098. EMERY GRINDER. NOAH CORSFIELD, Chicago, Ill., assignor to Abraham Hartz, trustee, Chicago, Ill. Filed Oct. 7, 1901. Serial No. 77,811. (No model.)



Claim.—1. In an emery grinder, the combination with a frame comprising a gear-post and seat-post with a seat thereon; of a main gear and gear-case mounted on the gear-post, driving mechanism therefor, and a pinion mounted on the gear-case, substantially as set forth.

2. In an emery grinder, a frame comprising a gear-post, seat-post, means for securing the same together and a pedal attached to the frame; combined with a main gear and crank-shaft on the gear-post, a pitman-rod connecting the pedal to the crank-shaft, a gear-case attached to the gear-post and a pinion mounted on the gear-case, substantially as set forth.

3. In an emery grinder, a frame comprising a gear-post, seat-post, means for securing the same together, and a pedal attached to the frame; combined with a main gear and crank-shaft on the gear-post, a pitman-rod connecting the pedal to the crank-shaft, a gear-case attached to the gear-post, a pinion mounted on the gear-case, an abrasive wheel on the pinion-shaft, and an operating-table carried by said case, substantially as set forth.

4. In an emery grinder, a gear-post, and a main gear, combined with a gear-case and operating-table; said gear-case adapted to fit over and be framed to the gear-post and having the operating-table extended horizontally therefrom, substantially as set forth.

5. In an emery grinder, a gear-post, and a main gear, combined with a gear-case and operating-table; said gear-case adapted to be supported by the gear-post and having an integrally-formed operating-table extended horizontally therefrom, substantially as set forth.

6. A frame for an emery grinder comprising a seat-post and gear-post, means for securing the same together and supporting them in their normal positions, and a gear-case and operating-table formed integrally with each other and supported by the gear-post, substantially as set forth.
